Returns: `reference_wrapper<const T>(t).`

```cpp
template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T> t) noexcept;
```

Returns: `cref(t.get()).`

### 20.14.6 Arithmetic operations [arithmetic.operations]

The library provides basic function object classes for all of the arithmetic operators in the language (7.6.5, 7.6.6).

#### 20.14.6.1 Class template plus [arithmetic.operations.plus]

```cpp
template<class T = void> struct plus {
    constexpr T operator()(const T& x, const T& y) const;
};
```

Returns: `x + y`.

```cpp
template<> struct plus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) + std::forward<U>(u));

        using is_transparent = unspecified;
};
```

Returns: `std::forward<T>(t) + std::forward<U>(u)`.

#### 20.14.6.2 Class template minus [arithmetic.operations.minus]

```cpp
template<class T = void> struct minus {
    constexpr T operator()(const T& x, const T& y) const;
};
```

Returns: `x - y`.

```cpp
template<> struct minus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) - std::forward<U>(u));

        using is_transparent = unspecified;
};
```

Returns: `std::forward<T>(t) - std::forward<U>(u)`.

© ISO/IEC 2020 – All rights reserved 671
20.14.6.3 Class template multiplies

```cpp
template<class T = void> struct multiplies {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
```

1 Returns: \( x \times y \).

```cpp
template<> struct multiplies<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) * std::forward<U>(u));
    using is_transparent = unspecified;
};
```

2 Returns: \( \text{std::forward}(t) \times \text{std::forward}(u) \).

20.14.6.4 Class template divides

```cpp
template<class T = void> struct divides {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```cpp
constexpr T operator()(const T& x, const T& y) const;
```

1 Returns: \( x / y \).

```cpp
template<> struct divides<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) / std::forward<U>(u));
    using is_transparent = unspecified;
};
```

2 Returns: \( \text{std::forward}(t) / \text{std::forward}(u) \).

20.14.6.5 Class template modulus

```cpp
template<class T = void> struct modulus {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```cpp
constexpr T operator()(const T& x, const T& y) const;
```

1 Returns: \( x \mod y \).

```cpp
template<> struct modulus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) \% std::forward<U>(u));
    using is_transparent = unspecified;
};
```

2 Returns: \( \text{std::forward}(t) \% \text{std::forward}(u) \).

20.14.6.6 Class template negate

```cpp
template<class T = void> struct negate {
    constexpr T operator()(const T& x) const;
};
```

```cpp
constexpr T operator()(const T& x) const;
```
constexpr T operator()(const T& x) const;

Returns: -x.

template<> struct negate<void> {
    template<class T> constexpr auto operator()(T&& t) const
    -> decltype(-std::forward<T>(t));
    using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&& t) const
-> decltype(-std::forward<T>(t));

Returns: -std::forward<T>(t).

20.14.7 Comparisons

The library provides basic function object classes for all of the comparison operators in the language (7.6.9, 7.6.10).

For templates less, greater, less_equal, and greater_equal, the specializations for any pointer type yield a result consistent with the implementation-defined strict total order over pointers (16.3.13). [Note: If a < b is well-defined for pointers a and b of type P, then \( (a < b) == \text{less}<(P)>(a, b), (a > b) == \text{greater}<(P)>(a, b), \) and so forth. —end note] For template specializations less<void>, greater<void>, less_equal<void>, and greater_equal<void>, if the call operator calls a built-in operator comparing pointers, the call operator yields a result consistent with the implementation-defined strict total order over pointers.

20.14.7.1 Class template equal_to

```cpp
template<class T = void> struct equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

customexpr bool operator()(const T& x, const T& y) const;

Returns: x == y.
```

```cpp
template<> struct equal_to<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) == std::forward<U>(u));
    using is_transparent = unspecified;
};
```

```cpp
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
-> decltype(std::forward<T>(t) == std::forward<U>(u));
```

Returns: std::forward<T>(t) == std::forward<U>(u).

20.14.7.2 Class template not_equal_to

```cpp
template<class T = void> struct not_equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

customexpr bool operator()(const T& x, const T& y) const;

Returns: x !== y.
```

```cpp
template<> struct not_equal_to<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) !== std::forward<U>(u));
    using is_transparent = unspecified;
};
```

Returns: std::forward<T>(t) !== std::forward<U>(u).

§ 20.14.7.2 ©ISO/IEC 2020 – All rights reserved 673
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) != std::forward<U>(u));

Returns: std::forward<T>(t) != std::forward<U>(u).

20.14.7.3 Class template greater

template<class T = void> struct greater {
  constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;

1 Returns: x > y.

template<> struct greater<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) > std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) > std::forward<U>(u));

2 Returns: std::forward<T>(t) > std::forward<U>(u).

20.14.7.4 Class template less

template<class T = void> struct less {
  constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;

1 Returns: x < y.

template<> struct less<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) < std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) < std::forward<U>(u));

2 Returns: std::forward<T>(t) < std::forward<U>(u).

20.14.7.5 Class template greater_equal

template<class T = void> struct greater_equal {
  constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;

1 Returns: x >= y.

template<> struct greater_equal<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) >= std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) >= std::forward<U>(u));

2 Returns: std::forward<T>(t) >= std::forward<U>(u).
20.14.7.6 Class template less_equal

```cpp
template<class T = void> struct less_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

1

Returns: \( x \leq y \).

```cpp
template<> struct less_equal<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) <= std::forward<U>(u));
    using is_transparent = unspecified;
};
```

2

```cpp
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
-> decltype(std::forward<T>(t) <= std::forward<U>(u));
```

20.14.7.7 Class compare_three_way

In this subclause, \( \text{BUILTIN-PTR-THREE-WAY}(T, U) \) for types \( T \) and \( U \) is a boolean constant expression. \( \text{BUILTIN-PTR-THREE-WAY}(T, U) \) is true if and only if \( \Rightarrow \) in the expression
deval\( \langle T \rangle() \Rightarrow \text{declval}\langle U \rangle() \)
resolves to a built-in operator comparing pointers.

```cpp
struct compare_three_way {
    template<class T, class U>
    requires three_way_comparable_with<T, U> || \( \text{BUILTIN-PTR-THREE-WAY}(T, U) \)
    constexpr auto operator()(T&& t, U&& u) const;
    using is_transparent = unspecified;
};
```

2

```cpp
template<class T, class U>
requires three_way_comparable_with<T, U> || \( \text{BUILTIN-PTR-THREE-WAY}(T, U) \)
constexpr auto operator()(T&& t, U&& u) const;
```

3

Effects:

1. If the expression \( \text{std::forward}\langle T\rangle(t) \Rightarrow \text{std::forward}\langle U\rangle(u) \) results in a call to a built-in operator \( \Rightarrow \) comparing pointers of type \( P \), the conversion sequences from both \( T \) and \( U \) to \( P \) are equality-preserving (18.2).

2. Otherwise, equivalent to: return std::forward\langle T\rangle(t) \Rightarrow std::forward\langle U\rangle(u);

20.14.8 Concept-constrained comparisons

In this subclause, \( \text{BUILTIN-PTR-CMP}(T, \text{op}, U) \) for types \( T \) and \( U \) and where \( \text{op} \) is an equality (7.6.10) or relational operator (7.6.9) is a boolean constant expression. \( \text{BUILTIN-PTR-CMP}(T, \text{op}, U) \) is true if and only if \( \text{op} \) in the expression
deval\( \langle T\rangle() \Rightarrow \text{declval}\langle U\rangle() \)
resolves to a built-in operator comparing pointers.

```cpp
struct ranges::equal_to {
    template<class T, class U>
    requires equality_comparable_with<T, U> || \( \text{BUILTIN-PTR-CMP}(T, ==, U) \)
    constexpr bool operator()(T&& t, U&& u) const;
};
```

§ 20.14.8 © ISO/IEC 2020 – All rights reserved
using is_transparent = unspecified;
};

Preconditions: If the expression `std::forward<T>(t) == std::forward<U>(u)` results in a call to a built-in operator `==` comparing pointers of type `P`, the conversion sequences from both `T` and `U` to `P` are equality-preserving (18.2).

Effects:
(3.1) — If the expression `std::forward<T>(t) == std::forward<U>(u)` results in a call to a built-in operator `==` comparing pointers: returns `false` if either (the converted value of) `t` precedes `u` or `u` precedes `t` in the implementation-defined strict total order over pointers (16.3.13) and otherwise `true`.
(3.2) — Otherwise, equivalent to: return `std::forward<T>(t) == std::forward<U>(u)`;

struct ranges::not_equal_to {
    template<class T, class U>
    requires equality_comparable_with<T, U> || BUILTIN-PTR-CMP(T, ==, U)
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

operator() has effects equivalent to:
    return !ranges::equal_to{}(std::forward<T>(t), std::forward<U>(u));

struct ranges::greater {
    template<class T, class U>
    requires totally_ordered_with<T, U> || BUILTIN-PTR-CMP(U, <, T)
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

operator() has effects equivalent to:
    return ranges::less{}(std::forward<U>(u), std::forward<T>(t));

struct ranges::less {
    template<class T, class U>
    requires totally_ordered_with<T, U> || BUILTIN-PTR-CMP(T, <, U)
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

Preconditions: If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers of type `P`, the conversion sequences from both `T` and `U` to `P` are equality-preserving (18.2). For any expressions `ET` and `EU` such that `decltype((ET))` is `T` and `decltype((EU))` is `U`, exactly one of `ranges::less{}(ET, EU)`, `ranges::less{}(EU, ET)`, or `ranges::equal_to{}(ET, EU)` is `true`.

Effects:
(7.1) — If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers: returns `true` if (the converted value of) `t` precedes `u` in the implementation-defined strict total order over pointers (16.3.13) and otherwise `false`.
(7.2) — Otherwise, equivalent to: return `std::forward<T>(t) < std::forward<U>(u)`;

struct ranges::greater_equal {
    template<class T, class U>
    requires totally_ordered_with<T, U> || BUILTIN-PTR-CMP(T, <, U)
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

operator() has effects equivalent to:

§ 20.14.8  ©ISO/IEC 2020 – All rights reserved 676
return !ranges::less{}(std::forward<T>(t), std::forward<U>(u));

struct ranges::less_equal {
    template<class T, class U>
    requires totally_ordered_with<T, U> || BUILTIN-PTR-CMP(U, <, T)
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

9
operator() has effects equivalent to:
return !ranges::less{}(std::forward<U>(u), std::forward<T>(t));

20.14.9 Logical operations

The library provides basic function object classes for all of the logical operators in the language (7.6.14, 7.6.15, 7.6.2.1).

20.14.9.1 Class template logical_and

template<class T = void> struct logical_and {
    constexpr bool operator()(const T& x, const T& y) const;
};

cconstexpr bool operator()(const T& x, const T& y) const;
1
Returns: x && y.

template<> struct logical_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) && std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
-> decltype(std::forward<T>(t) && std::forward<U>(u));
2
Returns: std::forward<T>(t) && std::forward<U>(u).

20.14.9.2 Class template logical_or

template<class T = void> struct logical_or {
    constexpr bool operator()(const T& x, const T& y) const;
};

cconstexpr bool operator()(const T& x, const T& y) const;
1
Returns: x || y.

template<> struct logical_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) || std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
-> decltype(std::forward<T>(t) || std::forward<U>(u));
2
Returns: std::forward<T>(t) || std::forward<U>(u).

20.14.9.3 Class template logical_not

template<class T = void> struct logical_not {
    constexpr bool operator()(const T& x) const;
};
constexpr bool operator()(const T& x) const {
    Returns: !x.
}

template<> struct logical_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(!std::forward<T>(t));
    using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&& t) const
        -> decltype(!std::forward<T>(t));

Returns: !std::forward<T>(t).

20.14.10 Bitwise operations [bitwise.operations]

The library provides basic function object classes for all of the bitwise operators in the language (7.6.11, 7.6.13, 7.6.12, 7.6.2.1).

20.14.10.1 Class template bit_and [bitwise.operations.and]

template<class T = void> struct bit_and {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

Returns: x & y.

template<> struct bit_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) & std::forward<U>(u));
    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) & std::forward<U>(u));

Returns: std::forward<T>(t) & std::forward<U>(u).

20.14.10.2 Class template bit_or [bitwise.operations.or]

template<class T = void> struct bit_or {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

Returns: x | y.

template<> struct bit_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) | std::forward<U>(u));
    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) | std::forward<U>(u));

Returns: std::forward<T>(t) | std::forward<U>(u).

20.14.10.3 Class template bit_xor [bitwise.operations.xor]

template<class T = void> struct bit_xor {
    constexpr T operator()(const T& x, const T& y) const;
};
constexpr T operator()(const T& x, const T& y) const;

Returns: \( x \oplus y \).

```cpp
template<> struct bit_xor<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) ^ std::forward<U>(u));
    using is_transparent = unspecified;
};
```

Returns: \( \text{std::forward}<T>(t) \oplus \text{std::forward}<U>(u) \).

20.14.10.4 Class template bit_not

```cpp
template<class T = void> struct bit_not {
    constexpr T operator()(const T& x) const;
};
```

Returns: \( \sim x \).

```cpp
template<> struct bit_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(\( \sim \text{std::forward}<T>(t) \));
    using is_transparent = unspecified;
};
```

Returns: \( \text{std::forward}<T>(t) \sim \).

20.14.11 Class identity

```cpp
struct identity {
    template<class T>
        constexpr T&& operator()(T&& t) const noexcept;
};
```

Effects: Equivalent to: \( \text{return } \text{std::forward}<T>(t) \).

20.14.12 Function template not_fn

```cpp
template<class F> constexpr unspecified not_fn(F&& f);
```

In the text that follows:

1. (1.1) \( g \) is a value of the result of a not_fn invocation,
2. (1.2) \( FD \) is the type \( \text{decay}_t<F> \),
3. (1.3) \( fd \) is the target object of \( g \) (20.14.2) of type \( FD \), direct-non-list-initialized with \( \text{std::forward}<F>(f) \),
4. (1.4) \( \text{call_args} \) is an argument pack used in a function call expression (7.6.1.2) of \( g \).

Mandates: \( \text{is_constructible}_v<FD, F> \land \text{is_move_constructible}_v<FD> \) is true.

Preconditions: \( FD \) meets the \text{Cpp17MoveConstructible} requirements.

Returns: A perfect forwarding call wrapper \( g \) with call pattern \( !\text{invoke}(fd, \text{call_args}...) \).
Throws: Any exception thrown by the initialization of \( fd \).

20.14.13 Function template \texttt{bind\_front} \hfill [func.bind.front]

\begin{verbatim}
template<class F, class... Args>
constexpr unspecified bind_front(F&& f, Args&&... args);
\end{verbatim}

1 In the text that follows:

\begin{enumerate}
\item \( g \) is a value of the result of a \texttt{bind\_front} invocation,
\item \( FD \) is the type \texttt{decay\_t}(<\texttt{F}>,)
\item \( fd \) is the target object of \( g \) (20.14.2) of type \( FD \), direct-non-list-initialized with \texttt{std::forward}<\texttt{F}>\(<f>\),
\item \( \text{BoundArgs} \) is a pack that denotes \texttt{decay\_t}(<\texttt{Args}>,...,
\item \( \text{bound\_args} \) is a pack of bound argument entities of \( g \) (20.14.2) of types \( \text{BoundArgs} \)\..., direct-non-list-initialized with \texttt{std::forward}<\texttt{Argrs}>(\texttt{args})\..., respectively, and
\item \( \text{call\_args} \) is an argument pack used in a function call expression (7.6.1.2) of \( g \).
\end{enumerate}

2 Mandates:

\begin{verbatim}
  is_constructible_v<FD, F> &&
  is_move_constructible_v<FD> &&
  (is_constructible_v<BoundArgs, Args> && ... ||
  (is_move_constructible_v<BoundArgs> && ...)
\end{verbatim}

is true.

3 Preconditions: \( FD \) meets the \texttt{Cpp17MoveConstructible} requirements. For each \( T_i \) in \( \text{BoundArgs} \), if \( T_i \) is an object type, \( T_i \) meets the \texttt{Cpp17MoveConstructible} requirements.

4 Returns: A perfect forwarding call wrapper \( g \) with call pattern \texttt{invoke(fd, bound\_args\..., call\_-\_args\...).}

5 Throws: Any exception thrown by the initialization of the state entities of \( g \) (20.14.2).

20.14.14 Function object binders \hfill [func.bind]

This subclause describes a uniform mechanism for binding arguments of callable objects.

20.14.14.1 Class template \texttt{is\_bind\_expression} \hfill [func.bind.isbind]

\begin{verbatim}
namespace std {
  template<class T> struct is_bind_expression; // see below
}
\end{verbatim}

1 The class template \texttt{is\_bind\_expression} can be used to detect function objects generated by \texttt{bind}. The function template \texttt{bind} uses \texttt{is\_bind\_expression} to detect subexpressions.

2 Specializations of the \texttt{is\_bind\_expression} template shall meet the \texttt{Cpp17UnaryTypeTrait} requirements (20.15.1). The implementation provides a definition that has a base characteristic of \texttt{true\_type} if \( T \) is a type returned from \texttt{bind}, otherwise it has a base characteristic of \texttt{false\_type}. A program may specialize this template for a program-defined type \( T \) to have a base characteristic of \texttt{true\_type} to indicate that \( T \) should be treated as a subexpression in a \texttt{bind} call.

20.14.14.2 Class template \texttt{is\_placeholder} \hfill [func.bind.isplace]

\begin{verbatim}
namespace std {
  template<class T> struct is_placeholder; // see below
}
\end{verbatim}

1 The class template \texttt{is\_placeholder} can be used to detect the standard placeholders \_1, \_2, and so on. The function template \texttt{bind} uses \texttt{is\_placeholder} to detect placeholders.

2 Specializations of the \texttt{is\_placeholder} template shall meet the \texttt{Cpp17UnaryTypeTrait} requirements (20.15.1). The implementation provides a definition that has the base characteristic of \texttt{integral\_constant}\langle\texttt{int}, J\rangle if \( T \) is the type of \texttt{std::placeholders::\_J}, otherwise it has a base characteristic of \texttt{integral\_constant}\langle\texttt{int}, 0\rangle. A program may specialize this template for a program-defined type \( T \) to have a base characteristic of \texttt{integral\_constant}\langle\texttt{int}, N\rangle with \( N > 0 \) to indicate that \( T \) should be treated as a placeholder type.
20.14.14.3 Function template bind

In the text that follows:

1. — g is a value of the result of a bind invocation,

2. — FD is the type decay_t<F>,

3. — fd is an lvalue that is a target object of g (20.14.2) of type FD direct-non-list-initialized with std::forward<F>(f),

4. — Ti is the ith type in the template parameter pack BoundArgs,

5. — TDj is the type decay_t<Ti>,

6. — tj is the ith argument in the function parameter pack bound_args,

7. — tdj is a bound argument entity of g (20.14.2) of type TDj direct-non-list-initialized with std::forward<Ti>(tj),

8. — Uj is the jth deduced type of the UnBoundArgs... parameter of the argument forwarding call wrapper, and

9. — uj is the jth argument associated with Uj.

template<class F, class... BoundArgs>
constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);

template<class R, class F, class... BoundArgs>
constexpr unspecified bind(R&& r, F&& f, BoundArgs&&... bound_args);

Mandates: is_constructible_v<FD, F> is true. For each Ti in BoundArgs, is_constructible_v<TDj, Ti> is true.

Preconditions: FD and each TDj meet the Cpp17MoveConstructible and Cpp17Destructible requirements.

INVOKE(fd, w1, w2, ..., wN) (20.14.3) is a valid expression for some values w1, w2, ..., wN, where N has the value sizeOf...(bound_args).

Returns: An argument forwarding call wrapper g (20.14.3). A program that attempts to invoke a volatile-qualified g is ill-formed. When g is not volatile-qualified, invocation of g(u1, u2, ..., uM) is expression-equivalent (16.3.11) to

INVOKE(static_cast<N>(vfd),
    static_cast<V1>(v1), static_cast<V2>(v2), ..., static_cast<VN>(vN))

for the first overload, and

INVOKER(static_cast<N>(vtd),
    static_cast<V1>(v1), static_cast<V2>(v2), ..., static_cast<VN>(vN))

for the second overload, where the values and types of the target argument vfd and of the bound arguments v1, v2, ..., vN are determined as specified below.

Throws: Any exception thrown by the initialization of the state entities of g.

[Note: If all of FD and TDj meet the requirements of Cpp17CopyConstructible, then the return type meets the requirements of Cpp17CopyConstructible. — end note]

The values of the bound arguments v1, v2, ..., vN and their corresponding types V1, V2, ..., VN depend on the types TDj derived from the call to bind and the cv-qualifiers cv of the call wrapper g as follows:

1. — if TDj is reference_wrapper<T>, the argument is tdj.get() and its type Vj is T;

2. — if the value of is_bind_expression_v<TDj> is true, the argument is

   static_cast<cv T&>(tdj)(std::forward<Uj>(uj)...) and its type Vj is invoke_result_t<TDj, Uj...&

3. — if the value j of is_placeholder_v<TDj> is not zero, the argument is std::forward<Uj>(uj) and its type Vj is Uj&;

4. — otherwise, the value is tdj and its type Vj is cv TDj&.

The value of the target argument vtd is fd and its corresponding type Vtd is cv FD&.

20.14.14.4 Placeholders

namespace std::placeholders {

§ 20.14.14.4 ©ISO/IEC 2020 – All rights reserved 681
1 All placeholder types meet the `Cpp17DefaultConstructible` and `Cpp17CopyConstructible` requirements, and their default constructors and copy/move constructors are constexpr functions that do not throw exceptions. It is implementation-defined whether placeholder types meet the `Cpp17CopyAssignable` requirements, but if so, their copy assignment operators are constexpr functions that do not throw exceptions.

2 Placeholders should be defined as:

```cpp
inline constexpr unspecified _1{};
```

If they are not, they are declared as:

```cpp
extern unspecified _1;
```

### 20.14.15 Function template mem_fn

```cpp
template<class R, class T> constexpr unspecified mem_fn(R T::* pm) noexcept;
```

1 Returns: A simple call wrapper (20.14.2) `fn` with call pattern `invoke(pmd, call_args...)`, where `pmd` is the target object of `fn` of type `R T::*` direct-non-list-initialized with `pm`, and `call_args` is an argument pack used in a function call expression (7.6.1.2) of `pm`.

### 20.14.16 Polymorphic function wrappers

1 This subclause describes a polymorphic wrapper class that encapsulates arbitrary callable objects.

#### 20.14.16.1 Class bad_function_call

An exception of type `bad_function_call` is thrown by `function::operator()` (20.14.16.2.4) when the function wrapper object has no target.

```cpp
namespace std {
    class bad_function_call : public exception {
        public:
            // see 17.9.2 for the specification of the special member functions
            const char* what() const noexcept override;
    }
}
```

2 Returns: An implementation-defined ntbs.

#### 20.14.16.2 Class template function

```cpp
namespace std {

template<class> class function; // not defined

template<class R, class... ArgTypes>
    class function<R(ArgTypes...)> {
        public:
            using result_type = R;

            // 20.14.16.2.1, construct/copy/destroy
            function() noexcept;
            function(nullptr_t) noexcept;
            function(const function&);
            function(function&&);  // 20.14.16.2.1
            function(function&);
            function(function&&);
        template<class F> function(F);
    }
}
```
The function class template provides polymorphic wrappers that generalize the notion of a function pointer. Wrappers can store, copy, and call arbitrary callable objects (20.14.2), given a call signature (20.14.2), allowing functions to be first-class objects.

A callable type (20.14.2) \( F \) is \textit{Lvalue-Callable} for argument types \( \text{ArgTypes} \) and return type \( R \) if the expression \( \text{INVOKER}_R(<\text{R}>(\text{declval<\text{F}}&)(), \text{declval<\text{ArgTypes}>}()...)) \) is well-formed (20.14.3).

The function class template is a call wrapper (20.14.2) whose call signature (20.14.2) is \( R(\text{ArgTypes}...) \).

[Note: The types deduced by the deduction guides for function may change in future versions of this International Standard. — end note]
for example, where \( f \)'s target is an object holding only a pointer or reference to an object and a member function pointer. \[\text{--- end note}\]

\[
\text{function(function&& f) noexcept;}
\]

**Postconditions:** If \( !f \), \( *\text{this} \) has no target; otherwise, the target of \( *\text{this} \) is equivalent to the target of \( f \) before the construction, and \( f \) is in a valid state with an unspecified value.

\[\text{--- end note}\]

\[
\text{template<class F> function(F f);}\]

**Constraints:** \( F \) is Lvalue-Callable \((20.14.16.2)\) for argument types \( \text{ArgTypes} \ldots \) and return type \( R \).

**Preconditions:** \( F \) meets the \( \text{Cpp17CopyConstructible} \) requirements.

**Postconditions:** \( !*\text{this} \) if any of the following hold:

- \( f \) is a null function pointer value.
- \( f \) is a null member pointer value.
- \( F \) is an instance of the \text{function} class template, and \( !f \).

Otherwise, \( *\text{this} \) targets a copy of \( f \) initialized with \( \text{std}::\text{move}(f) \). \[\text{--- end note}\]

**Throws:** Nothing if \( f \) is a specialization of \text{reference_wrapper} or a function pointer. Otherwise, may throw \text{bad_alloc} or any exception thrown by \( F \)'s copy or move constructor.

\[
\text{function& operator=(const function& f);}\]

**Effects:** As if by \( \text{function}(f)\).\text{swap}(\*\text{this});

**Returns:** \( \*\text{this} \).

\[
\text{function& operator=(function&& f);}\]

**Effects:** Replaces the target of \( \*\text{this} \) with the target of \( f \).

**Returns:** \( \*\text{this} \).

\[
\text{function& operator=(nullptr_t) noexcept;}
\]

**Effects:** If \( \*\text{this} \neq \text{nullptr} \), destroys the target of \( \text{this} \).

**Postconditions:** \( !(\*\text{this}) \).

**Returns:** \( \*\text{this} \).

\[
\text{template<class F> function& operator=(F&& f);}\]

**Constraints:** \( \text{decay_t}<F> \) is Lvalue-Callable \((20.14.16.2)\) for argument types \( \text{ArgTypes} \ldots \) and return type \( R \).

**Effects:** As if by: \( \text{function(\text{std}::\text{forward}<F>(f))}\).\text{swap}(\*\text{this});

**Returns:** \( \*\text{this} \).
template<class F> function& operator=(reference_wrapper<F> f) noexcept;

Effects: As if by: function(f).swap(*this);

Returns: *this.

~function();

Effects: If *this != nullptr, destroys the target of this.

20.14.16.2.2 Modifiers

void swap(function& other) noexcept;

Effects: Interchanges the targets of *this and other.

20.14.16.2.3 Capacity

explicit operator bool() const noexcept;

Returns: true if *this has a target, otherwise false.

20.14.16.2.4 Invocation

R operator()(ArgTypes... args) const;

Returns: INVOKE<R>(f, std::forward<ArgTypes>(args)...)(20.14.3), where f is the target object (20.14.2) of *this.

Throws: bad_function_call if *this; otherwise, any exception thrown by the wrapped callable object.

20.14.16.2.5 Target access

const type_info& target_type() const noexcept;

Returns: If *this has a target of type T, typeid(T); otherwise, typeid(void).

template<class T> T* target() noexcept;
template<class T> const T* target() const noexcept;

Returns: If target_type() == typeid(T) a pointer to the stored function target; otherwise a null pointer.

20.14.16.2.6 Null pointer comparison functions

template<class R, class... ArgTypes>
bool operator==(const function<R(ArgTypes...)>& f, nullptr_t) noexcept;

Returns: !f.

20.14.16.2.7 Specialized algorithms

template<class R, class... ArgTypes>
void swap(function<R(ArgTypes...)>& f1, function<R(ArgTypes...)>& f2) noexcept;

Effects: As if by: f1.swap(f2);
The Boyer-Moore searcher implements the Boyer-Moore search algorithm. The Boyer-Moore-Horspool searcher implements the Boyer-Moore-Horspool search algorithm. In general, the Boyer-Moore searcher will use more memory and give better runtime performance than Boyer-Moore-Horspool.

20.14.17.1 Class template default_searcher

```cpp
template<class ForwardIterator1, class BinaryPredicate = equal_to<>>
class default_searcher {  
public:
    constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,  
        BinaryPredicate pred = BinaryPredicate());

    template<class ForwardIterator2>
    constexpr pair<ForwardIterator2, ForwardIterator2>  
        operator()(ForwardIterator2 first, ForwardIterator2 last) const;

private:
    ForwardIterator1 pat_first_;  // exposition only
    ForwardIterator1 pat_last_;  // exposition only
    BinaryPredicate pred_;  // exposition only
};
```

1 Effects: Constructs a default_searcher object, initializing pat_first_ with pat_first, pat_last_ with pat_last, and pred_ with pred.

2 Throws: Any exception thrown by the copy constructor of BinaryPredicate or ForwardIterator1.

3 Effects: Returns a pair of iterators i and j such that

- i == search(first, last, pat_first_, pat_last_, pred_), and
- if i == last, then j == last, otherwise j == next(i, distance(pat_first_, pat_last_)).

20.14.17.2 Class template boyer_moore_searcher

```cpp
template<class RandomAccessIterator1,  
        class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,  
        class BinaryPredicate = equal_to<>>
class boyer_moore_searcher {  
public:
    boyer_moore_searcher(RandomAccessIterator1 pat_first,  
        RandomAccessIterator1 pat_last,  
        Hash hf = Hash(),  
        BinaryPredicate pred = BinaryPredicate());

    template<class RandomAccessIterator2>  
    pair<RandomAccessIterator2, RandomAccessIterator2>  
        operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

private:
    RandomAccessIterator1 pat_first_;  // exposition only
    RandomAccessIterator1 pat_last_;  // exposition only
    Hash hash_;  // exposition only
    BinaryPredicate pred_;  // exposition only
};
```

Preconditions: The value type of `RandomAccessIterator1` meets the `Cpp17DefaultConstructible` requirements, the `Cpp17CopyConstructible` requirements, and the `Cpp17CopyAssignable` requirements.

Preconditions: Let \( V \) be `iterator_traits<RandomAccessIterator1>::value_type`. For any two values \( A \) and \( B \) of type \( V \), if \( \text{pred}(A, B) == \text{true} \), then \( \text{hf}(A) == \text{hf}(B) \) is true.

Effects: Initializes `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.

Throws: Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1`, or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

Mandates: `RandomAccessIterator1` and `RandomAccessIterator2` have the same value type.

Effects: Finds a subsequence of equal values in a sequence.

Returns: A pair of iterators \( i \) and \( j \) such that

\[
\begin{align*}
&\text{— } i \text{ is the first iterator in the range } \text{[first, last - (pat_last_ - pat_first_))} \text{ such that for every non-negative integer } n \text{ less than } \text{pat_last_ - pat_first_} \text{ the following condition holds:} \\
&\quad \text{pred}(*(i + n), *(\text{pat_first_} + n)) != \text{false}, \text{ and} \\
&\quad \text{(7.1)} \\
&\text{— } j \text{ == next}(i, \text{distance}(\text{pat_first_}, \text{pat_last_})). \\
&\text{Returns } \text{make_pair}(\text{first, first}) \text{ if } \text{[pat_first_, pat_last_]} \text{ is empty, otherwise returns } \text{make_pair}(\text{last, last}) \text{ if no such iterator is found.} \\
&\quad \text{(7.2)}
\end{align*}
\]

Complexity: At most \((last - first) * (\text{pat_last_} - \text{pat_first_})\) applications of the predicate.

20.14.17.3 Class template `boyer_moore_horspool_searcher` [func.search.bm]
BinaryPredicate pred = BinaryPredicate();

Preconditions: The value type of `RandomAccessIterator1` meets the `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, and `Cpp17CopyAssignable` requirements.

Preconditions: Let V be `iter_traits<RandomAccessIterator1>::value_type`. For any two values A and B of type V, if `pred(A, B) == true`, then `hf(A) == hf(B)` is true.

Effects: Initializes `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `has` with `hf`, and `pred_` with `pred`.

Throws: Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1` or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```cpp
template<class RandomAccessIterator1>
    class hash<Key>; // default specialization of `hash` for `Key`
```
20.15 Metaprogramming and type traits

This subclause describes components used by C++ programs, particularly in templates, to support the widest possible range of types, optimise template code usage, detect type related user errors, and perform type inference and transformation at compile time. It includes type classification traits, type property inspection traits, and type transformations. The type classification traits describe a complete taxonomy of all possible C++ types, and state where in that taxonomy a given type belongs. The type property inspection traits allow important characteristics of types or of combinations of types to be inspected. The type transformations allow certain properties of types to be manipulated.

All functions specified in this subclause are signal-safe (17.13.4).

20.15.1 Requirements

1 A `Cpp17UnaryTypeTrait` describes a property of a type. It shall be a class template that takes one template type argument and, optionally, additional arguments that help define the property being described. It shall be `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, and publicly and unambiguously derived, directly or indirectly, from its base characteristic, which is a specialization of the template `integral_constant` (20.15.3), with the arguments to the template `integral_constant` determined by the requirements for the particular property being described. The member names of the base characteristic shall not be hidden and shall be unambiguously available in the `Cpp17UnaryTypeTrait`.

2 A `Cpp17BinaryTypeTrait` describes a relationship between two types. It shall be a class template that takes two template type arguments and, optionally, additional arguments that help define the relationship being described. It shall be `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, and publicly and unambiguously derived, directly or indirectly, from its base characteristic, which is a specialization of the template `integral_constant` (20.15.3), with the arguments to the template `integral_constant` determined by the requirements for the particular relationship being described. The member names of the base characteristic shall not be hidden and shall be unambiguously available in the `Cpp17BinaryTypeTrait`.

3 A `Cpp17TransformationTrait` modifies a property of a type. It shall be a class template that takes one template type argument and, optionally, additional arguments that help define the modification. It shall define a publicly accessible nested type named `type`, which shall be a synonym for the modified type.

4 Unless otherwise specified, the behavior of a program that adds specializations for any of the templates specified in this subclause 20.15 is undefined.

5 Unless otherwise specified, an incomplete type may be used to instantiate a template specified in this subclause. The behavior of a program is undefined if:

   (5.1) an instantiation of a template specified in subclause 20.15 directly or indirectly depends on an incompletely-defined object type T, and
   (5.2) that instantiation could yield a different result were T hypothetically completed.

20.15.2 Header `<type_traits>` synopsis

```cpp

template<class S1, class S2, class M1, class M2>
constexpr bool is_corresponding_member(M1 S1::*m1, M2 S2::*m2) noexcept;

// 20.15.10, constant evaluation context
constexpr bool is_constant_evaluated() noexcept;

namespace std {

  template<class T, T v>
    struct integral_constant {
      static constexpr T value = v;
      using value_type = T;
      using type = integral_constant<T, v>;

      constexpr operator value_type() const noexcept { return value; }
      constexpr value_type operator()() const noexcept { return value; }
    };

} // namespace std

The class template integral_constant, alias template bool_constant, and its associated typedef-names true_type and false_type are used as base classes to define the interface for various type traits.

20.15.4 Unary type traits

This subclause contains templates that may be used to query the properties of a type at compile time.

Each of these templates shall be a Cpp17UnaryTypeTrait (20.15.1) with a base characteristic of true_type if the corresponding condition is true, otherwise false_type.

20.15.4.1 Primary type categories

The primary type categories correspond to the descriptions given in subclause 6.8 of the C++ standard.

For any given type T, the result of applying one of these templates to T and to cv T shall yield the same result.

[Note: For any given type T, exactly one of the primary type categories has a value member that evaluates to true. — end note]

</table>

20.15.4.3 Type properties [meta.unary.prop]

1 These templates provide access to some of the more important properties of types.

2 It is unspecified whether the library defines any full or partial specializations of any of these templates.

3 For all of the class templates X declared in this subclause, instantiating that template with a template-argument that is a class template specialization may result in the implicit instantiation of the template argument if and only if the semantics of X require that the argument is a complete type.

4 For the purpose of defining the templates in this subclause, a function call expression `declval<T>();` for any type T is considered to be a trivial (6.8, 11.4.3) function call that is not an odr-use (6.3) of `declval` in the context of the corresponding definition notwithstanding the restrictions of 20.2.6.

</tbody>
</table>

5 [Example:

```cpp
is_const_v<const volatile int> // true
is_const_v<const int*> // false
is_const_v<const int&> // false
is_const_v<int[3]> // false
is_const_v<const int[3]> // true
```

— end example]

6 [Example:

```cpp
5

— end example
```
remove_const_t<const volatile int>  // volatile int
remove_const_t<const int* const>  // const int*
remove_const_t<const int&>        // const int&

—end example

Example:

```c
// Given:
struct P final { };  
union U1 { };  
union U2 final { };  

// the following assertions hold:
static_assert(!is_final_v<int>);  
static_assert(is_final_v<P>);  
static_assert(!is_final_v<U1>);  
static_assert(is_final_v<U2>);  

—end example
```

The predicate condition for a template specialization `is_constructible<T, Args...>` shall be satisfied if and only if the following variable definition would be well-formed for some invented variable `t`:

```cpp
T t(declval<Args>()...);
```

[Note: These tokens are never interpreted as a function declaration. —end note] Access checking is performed as if in a context unrelated to `T` and any of the `Args`. Only the validity of the immediate context of the variable initialization is considered. [Note: The evaluation of the initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. —end note]

The predicate condition for a template specialization `has_unique_object_representations<T>` shall be satisfied if and only if:

(9.1) — `T` is trivially copyable, and
(9.2) — any two objects of type `T` with the same value have the same object representation, where two objects of array or non-union class type are considered to have the same value if their respective sequences of direct subobjects have the same values, and two objects of union type are considered to have the same value if they have the same active member and the corresponding members have the same value.

The set of scalar types for which this condition holds is implementation-defined. [Note: If a type has padding bits, the condition does not hold; otherwise, the condition holds true for integral types. —end note]

### 20.15.5 Type property queries

This subclause contains templates that may be used to query properties of types at compile time.

<table>
<thead>
<tr>
<th>Template</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>template&lt;class T&gt;</code></td>
<td><code>alignof(T).</code></td>
</tr>
<tr>
<td><code>struct alignment_of;</code></td>
<td><code>alignof(T) is a valid expression (7.6.2.5)</code></td>
</tr>
<tr>
<td><code>template&lt;class T&gt;</code></td>
<td><code>If T names an array type, an integer value representing the number of dimensions of T; otherwise, 0.</code></td>
</tr>
<tr>
<td><code>struct rank;</code></td>
<td><code>If T is not an array type, or if it has rank less than or equal to I, or if I is 0 and T has type “array of unknown bound of U”, then 0; otherwise, the bound (9.3.3.4) of the I^th dimension of T, where indexing of I is zero-based.</code></td>
</tr>
</tbody>
</table>

Each of these templates shall be a Cpp17UnaryTypeTrait (20.15.1) with a base characteristic of `integral_constant<size_t, Value>`.

[Example:}
// the following assertions hold:
assert(rank_v<int> == 0);
assert(rank_v<int[2]> == 1);
assert(rank_v<int[] [4]> == 2);
— end example]

[Example:

// the following assertions hold:
assert(extent_v<int> == 0);
assert(extent_v<int[2] > == 2);
assert(extent_v<int[2] [4] > == 2);
assert(extent_v<int[] [4] > == 0);
assert((extent_v<int, 1>) == 0);
assert((extent_v<int[2], 1>) == 0);
assert((extent_v<int[2] [4], 1>) == 4);
assert((extent_v<int[], 1>) == 4);

— end example]

20.15.6 Relationships between types [meta.rel]

1 This subclause contains templates that may be used to query relationships between types at compile time.

2 Each of these templates shall be a Cpp17BinaryTypeTrait (20.15.1) with a base characteristic of true_type if the corresponding condition is true, otherwise false_type.

<table>
<thead>
<tr>
<th>Template</th>
<th>Condition</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>template&lt;class T, class U&gt; struct is_same;</td>
<td>T and U name the same type with the same cv-qualifications</td>
<td></td>
</tr>
<tr>
<td>template&lt;class Base, class Derived&gt; struct is_base_of;</td>
<td>Base is a base class of Derived (11.7) without regard to cv-qualifiers or Base and Derived are not unions and name the same class type without regard to cv-qualifiers</td>
<td>If Base and Derived are non-union class types and are not possibly cv-qualified versions of the same type, Derived shall be a complete type. [Note: Base classes that are private, protected, or ambiguous are, nonetheless, base classes. —end note]</td>
</tr>
<tr>
<td>template&lt;class From, class To&gt; struct is_convertible;</td>
<td>see below</td>
<td>From and To shall be complete types, cv void, or arrays of unknown bound.</td>
</tr>
<tr>
<td>template&lt;class From, class To&gt; struct is_nothrow_convertible;</td>
<td>is_convertible_v&lt;From, To&gt; is true and the conversion, as defined by is_convertible, is known not to throw any exceptions (7.6.2.6)</td>
<td>From and To shall be complete types, cv void, or arrays of unknown bound.</td>
</tr>
<tr>
<td>template&lt;class T, class U&gt; struct is_layout_compatible;</td>
<td>T and U are layout-compatible (6.8)</td>
<td>T and U shall be complete types, cv void, or arrays of unknown bound.</td>
</tr>
</tbody>
</table>
Table 51: Type relationship predicates (continued)

<table>
<thead>
<tr>
<th>Template</th>
<th>Condition</th>
</tr>
</thead>
</table>
| `template<class Base, class Derived>
struct is_pointer_interconvertible_base_of;` | Derived is unambiguously derived from Base without regard to cv-qualifiers, and each object of type Derived is pointer-interconvertible (6.8.2) with its Base subobject, or Base and Derived are not unions and name the same class type without regard to cv-qualifiers. | If Base and Derived are non-union class types and are not (possibly cv-qualified versions of) the same type, Derived shall be a complete type. |
| `template<class Fn, class... ArgTypes>
struct is_invocable;`                      | The expression \( \text{INVOKE}(\text{declval}<Fn>(), \text{declval}<ArgTypes>(...) \) is well-formed when treated as an unevaluated operand | Fn and all types in the template parameter pack ArgTypes shall be complete types, cv void, or arrays of unknown bound. |
| `template<class R, class Fn, class... ArgTypes>
struct is_invocable_r;`                   | The expression \( \text{INVOKE}<R>(\text{declval}<Fn>(), \text{declval}<ArgTypes>(...) \) is well-formed when treated as an unevaluated operand | Fn, R, and all types in the template parameter pack ArgTypes shall be complete types, cv void, or arrays of unknown bound. |
| `template<class Fn, class... ArgTypes>
struct is_nothrow_invocable;`              | \( \text{is_invocable_v}<\text{Fn}, \text{ArgTypes}...> \) is true and the expression \( \text{INVOKE}(\text{declval}<\text{Fn}>(), \text{declval}<\text{ArgTypes}>(...) \) is known not to throw any exceptions (7.6.2.6) | Fn and all types in the template parameter pack ArgTypes shall be complete types, cv void, or arrays of unknown bound. |
| `template<class R, class Fn, class... ArgTypes>
struct is_nothrow_invocable_r;`            | \( \text{is_invocable_r_v}<\text{R}, \text{Fn}, \text{ArgTypes}...> \) is true and the expression \( \text{INVOKE}<\text{R}>(\text{declval}<\text{Fn}>(), \text{declval}<\text{ArgTypes}>(...) \) is known not to throw any exceptions (7.6.2.6) | Fn, R, and all types in the template parameter pack ArgTypes shall be complete types, cv void, or arrays of unknown bound. |

3 For the purpose of defining the templates in this subclause, a function call expression \( \text{declval}<T>() \) for any type \( T \) is considered to be a trivial (6.8, 11.4.3) function call that is not an odr-use (6.3) of \( \text{declval} \) in the context of the corresponding definition notwithstanding the restrictions of 20.2.6.

4 [Example:
```
struct B {}
struct B1 : B {}
struct B2 : B {}
struct D : private B1, private B2 {}

is_base_of_v<B, D> // true
is_base_of_v<const B, D> // true
is_base_of_v<B, const D> // true
is_base_of_v<B, const B> // true
is_base_of_v<D, B> // false
is_base_of_v<B&, D&> // false
is_base_of_v<B[3], D[3]> // false
is_base_of_v<int, int> // false
```
— end example]
The predicate condition for a template specialization `is_convertible<From, To>` shall be satisfied if and only if the return expression in the following code would be well-formed, including any implicit conversions to the return type of the function:

```cpp
to test() {
    return declval<From>();
}
```

[Note: This requirement gives well-defined results for reference types, void types, array types, and function types. — end note] Access checking is performed in a context unrelated to `To` and `From`. Only the validity of the immediate context of the `return` statement (8.7.3) (including initialization of the returned object or reference) is considered. [Note: The initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. — end note]

### 20.15.7 Transformations between types

This subclause contains templates that may be used to transform one type to another following some predefined rule.

Each of the templates in this subclause shall be a `Cpp17TransformationTrait` (20.15.1).

#### 20.15.7.1 Const-volatile modifications

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
</table>
| `template<class T>
struct remove_const;` | The member typedef `type` names the same type as `T` except that any top-level const-qualifier has been removed. *[Example: `remove_const_t<const volatile int>` evaluates to `volatile int`, whereas `remove_const_t<const int*>` evaluates to `const int*`. — end example]* |
| `template<class T>
struct remove_volatile;` | The member typedef `type` names the same type as `T` except that any top-level volatile-qualifier has been removed. *[Example: `remove_volatile_t<const volatile int>` evaluates to `const int`, whereas `remove_volatile_t<volatile int*>` evaluates to `volatile int*`. — end example]* |
| `template<class T>
struct remove_cv;` | The member typedef `type` shall be the same as `T` except that any top-level cv-qualifier has been removed. *[Example: `remove_cv_t<const volatile int>` evaluates to `int`, whereas `remove_cv_t<const volatile int*>` evaluates to `volatile int*`. — end example]* |
| `template<class T>
struct add_const;` | If `T` is a reference, function, or top-level const-qualified type, then `type` names the same type as `T`, otherwise `T const`. |
| `template<class T>
struct add_volatile;` | If `T` is a reference, function, or top-level volatile-qualified type, then `type` names the same type as `T`, otherwise `T volatile`. |
| `template<class T>
struct add_cv;` | The member typedef `type` names the same type as `add_const_t<add_volatile_t<T>>`. |

#### 20.15.7.2 Reference modifications

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
</table>
| `template<class T>
struct remove_reference;` | If `T` has type “reference to `T1`” then the member typedef `type` names `T1`; otherwise, `type` names `T`. |
| `template<class T>
struct add_lvalue_reference;` | If `T` names a referenceable type (16.3.23) then the member typedef `type` names `T`; otherwise, `type` names `T`. [Note: This rule reflects the semantics of reference collapsing (9.3.3.2). — end note] |
Table 53: Reference modifications (continued)

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>template&lt;class T&gt; struct add_rvalue_reference;</td>
<td>If T names a referenceable type then the member typedef type names T&amp;&amp;; otherwise, type names T. [Note: This rule reflects the semantics of reference collapsing (9.3.3.2). For example, when a type T names a type T1&amp;, the type add_rvalue_reference_t&lt;T&gt; is not an rvalue reference. [end note]]</td>
</tr>
</tbody>
</table>

20.15.7.3 Sign modifications

Table 54: Sign modifications

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>template&lt;class T&gt; struct make_signed;</td>
<td>If T names a (possibly cv-qualified) signed integer type (6.8.1) then the member typedef type names the type T; otherwise, if T names a (possibly cv-qualified) unsigned integer type then type names the corresponding signed integer type, with the same cv-qualifiers as T; otherwise, type names the signed integer type with smallest rank (6.8.4) for which sizeof(T) == sizeof(type), with the same cv-qualifiers as T. [Mandates: T is an integral or enumeration type other than cv bool.]</td>
</tr>
<tr>
<td>template&lt;class T&gt; struct make_unsigned;</td>
<td>If T names a (possibly cv-qualified) unsigned integer type (6.8.1) then the member typedef type names the type T; otherwise, if T names a (possibly cv-qualified) signed integer type then type names the corresponding unsigned integer type, with the same cv-qualifiers as T; otherwise, type names the unsigned integer type with smallest rank (6.8.4) for which sizeof(T) == sizeof(type), with the same cv-qualifiers as T. [Mandates: T is an integral or enumeration type other than cv bool.]</td>
</tr>
</tbody>
</table>

20.15.7.4 Array modifications

Table 55: Array modifications

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>template&lt;class T&gt; struct remove_extent;</td>
<td>If T names a type &quot;array of U&quot;, the member typedef type shall be U, otherwise T. [Note: For multidimensional arrays, only the first array dimension is removed. For a type &quot;array of const U&quot;, the resulting type is const U. [end note]]</td>
</tr>
<tr>
<td>template&lt;class T&gt; struct remove_all_extents;</td>
<td>If T is &quot;multi-dimensional array of U&quot;, the resulting member typedef type is U, otherwise T.</td>
</tr>
</tbody>
</table>

1 \[Example:\]
```
// the following assertions hold:
assert((is_same_v<remove_extent_t<int>, int>));
assert((is_same_v<remove_extent_t<int[2]>, int>));
assert((is_same_v<remove_extent_t<int[2][3], int[3]>>));
assert((is_same_v<remove_extent_t<int>[3][3], int[3][3]>>));
// end example\]
```

2 \[Example:\]
```
// the following assertions hold:
assert((is_same_v<remove_all_extents_t<int>, int>));
assert((is_same_v<remove_all_extents_t<int[2]>, int>));
assert((is_same_v<remove_all_extents_t<int[2][3], int>));
assert((is_same_v<remove_all_extents_t<int>[3], int>));
// end example\]
```
20.15.7.5 Pointer modifications

Table 56: Pointer modifications

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>template&lt;class T&gt;</td>
<td>If T has type “(possibly cv-qualified) pointer to T1” then the member typedef type names T1; otherwise, it names T.</td>
</tr>
<tr>
<td>struct remove_pointer;</td>
<td></td>
</tr>
<tr>
<td>template&lt;class T&gt;</td>
<td>If T names a referenceable type (16.3.23) or a cv void type then the member typedef type names the same type as remove_reference_t&lt;T&gt;.*; otherwise, type names T.</td>
</tr>
<tr>
<td>struct add_pointer;</td>
<td></td>
</tr>
</tbody>
</table>

20.15.7.6 Other transformations

Table 57: Other transformations

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>template&lt;class T&gt;</td>
<td>The member typedef type names the type T.</td>
</tr>
<tr>
<td>struct type_identity;</td>
<td></td>
</tr>
</tbody>
</table>
| template<size_t Len,      | The value of default-alignment shall be the most stringent alignment requirement for any C++ object type whose size is no greater than Len (6.8). The member typedef type shall be a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most Len and whose alignment is a divisor of Align.  
**Mandates:** Len is not zero. Align is equal to alignof(T) for some type T or to default-alignment. |
| size_t Align =            |                                                                                                                                                                                      |
| default-alignment>        |                                                                                                                                                                                      |
| struct aligned_storage;   |                                                                                                                                                                                      |
| template<size_t Len,      | The member typedef type shall be a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in Types; its size shall be at least Len. The static member alignment_value shall be an integral constant of type size_t whose value is the strictest alignment of all types listed in Types.  
**Mandates:** At least one type is provided. Each type in the template parameter pack Types is a complete object type. |
| class... Types>           |                                                                                                                                                                                      |
| struct aligned_union;     |                                                                                                                                                                                      |
| template<class T>         | The member typedef type names the same type as remove_cv_t<remove_reference_t<T>>.                                                                                                                                                               |
| struct remove_cvref;      |                                                                                                                                                                                      |
| template<class T>         | Let U be remove_reference_t<T>. If is_array_v<U> is true, the member typedef type equals remove_extent_t<U>.*; If is_function_v<U> is true, the member typedef type equals add_pointer_t<U>. Otherwise the member typedef type equals remove_cv_t<U>. [Note: This behavior is similar to the value-to-rvalue (7.3.1), array-to-pointer (7.3.2), and function-to-pointer (7.3.3) conversions applied when an value is used as an rvalue, but also strips cv-qualifiers from class types in order to more closely model by-value argument passing. —end note] |
| struct decay;             |                                                                                                                                                                                      |
| template<bool B, class T = | If B is true, the member typedef type shall equal T; otherwise, there shall be no member type.                                                                                  |
| void> struct enable_if;   |                                                                                                                                                                                      |
| template<bool B, class T, | If B is true, the member typedef type shall equal T. If B is false, the member typedef type shall equal F.                                                                                     |
| class F> struct conditional; |                                                                                                                                                                                                     |
| template<class... T>      | Unless this trait is specialized (as specified in Note B, below), the member type is defined or omitted as specified in Note A, below. If it is omitted, there shall be no member type. Each type in the template parameter pack T shall be complete, cv void, or an array of unknown bound. |
| struct common_type;       |                                                                                                                                                                                      |
| template<class, class,    | Unless this trait is specialized (as specified in Note D, below), there shall be no member type.                                                                                       |
| template<class> class,    |                                                                                                                                                                                      |
| template<class> class>    |                                                                                                                                                                                      |
| struct basic_common_reference; |                                                                                                                                                                                                     |

<tr>
<td>template&lt;class T&gt; unwrap_ref_decay;</td>
<td>The member typedef type of <code>unwrap_ref_decay&lt;T&gt;</code> denotes the type <code>unwrap_reference_t&lt;decay_t&lt;T&gt;&gt;</code>.</td>
</tr>
</tbody>
</table>

1 **[Note:** A typical implementation would define `aligned_storage` as:  
```cpp
template<size_t Len, size_t Alignment>
struct aligned_storage {
  typedef struct {
    alignas(Alignment) unsigned char __data[Len];
  } type;
};
```
—end note**

2 In addition to being available via inclusion of the `<type_traits>` header, the templates `unwrap_reference`, `unwrap_ref_decay`, `unwrap_reference_t`, and `unwrap_ref_decay_t` are available when the header `<functional>` (20.14.1) is included.

3 Let:  
(3.1) — `CREF(A)` be `add_lvalue_reference_t<const remove_reference_t<A>>`,  
(3.2) — `XREF(A)` denote a unary alias template T such that T<U> denotes the same type as U with the addition of A’s cv and reference qualifiers, for a non-reference cv-unqualified type U,  
(3.3) — `COPYCV(FROM, TO)` be an alias for type TO with the addition of FROM’s top-level cv-qualifiers. [Example: `COPYCV(const int, volatile short)` is an alias for `const volatile short`. —end example]  
(3.4) — `COND-RES(X, Y)` be `decltype(false ? declval<X(&)()>()() : declval<Y(&)()>()())`.  

Given types A and B, let X be `remove_reference_t<A>`, let Y be `remove_reference_t<B>`, and let `COMMON-REF(A, B)` be:  
(3.5) — If A and B are both lvalue reference types, `COMMON-REF(A, B)` is `COND-RES(COPYCV(X, Y) &)` if that type exists and is a reference type.  
(3.6) — Otherwise, let C be `remove_reference_t<COMMON-REF(Xk, Yk)>&k`. If A and B are both rvalue reference types, C is well-formed, and `is_convertible_v<C, A> &k` is `is_convertible_v<B, C>` is true, then `COMMON-REF(A, B)` is C.
Otherwise, let D be \texttt{COMMON-REF} \texttt{(const Xk, Yk)}. If A is an rvalue reference and B is an lvalue reference and D is well-formed and \texttt{is_convertible_v<&A, D>} is true, then \texttt{COMMON-REF(A, B)} is D.

Otherwise, if A is an lvalue reference and B is an rvalue reference, then \texttt{COMMON-REF(A, B)} is \texttt{COMMON-REF(B, A)}.

Otherwise, \texttt{COMMON-REF(A, B)} is ill-formed.

If any of the types computed above is ill-formed, then \texttt{COMMON-REF(A, B)} is ill-formed.

Note A: For the \texttt{common_type} trait applied to a template parameter pack T of types, the member \texttt{type} shall be either defined or not present as follows:

1. If \texttt{sizeof...(T)} is zero, there shall be no member \texttt{type}.

2. If \texttt{sizeof...(T)} is one, let T0 denote the sole type constituting the pack T. The member \texttt{typedef-name} type shall denote the same type, if any, as \texttt{common_type_t<T0, T0>}; otherwise there shall be no member \texttt{type}.

3. If \texttt{sizeof...(T)} is two, let the first and second types constituting T be denoted by T1 and T2, respectively, and let D1 and D2 denote the same types as \texttt{decay_t<T1>} and \texttt{decay_t<T2>}, respectively.

   - If \texttt{is_same_v<T1, D1>} is false or \texttt{is_same_v<T2, D2>} is false, let C denote the same type, if any, as \texttt{common_type_t<D1, D2>}.

   - [Note: None of the following will apply if there is a specialization \texttt{common_type<D1, D2>.} — end note]

   - Otherwise, if

     \texttt{decay_t<decltype(false ? declval<D1>() : declval<D2>())>
     denotes a valid type, let C denote that type.}

   - Otherwise, if \texttt{COND-RES(CREF(D1), CREF(D2))} denotes a type, let C denote the type \texttt{decay_t<COND-RES(CREF(D1), CREF(D2))>.

In either case, the member \texttt{typedef-name} type shall denote the same type, if any, as C. Otherwise, there shall be no member \texttt{type}.

4. If \texttt{sizeof...(T)} is greater than two, let T1, T2, and R, respectively, denote the first, second, and (pack of) remaining types constituting T. Let C denote the same type, if any, as \texttt{common_type_t<T1, T2>}. If there is such a type C, the member \texttt{typedef-name} type shall denote the same type, if any, as \texttt{common_type_t<C, R, ...>}. Otherwise, there shall be no member \texttt{type}.

Note B: Notwithstanding the provisions of \texttt{20.15.2}, and pursuant to \texttt{16.5.4.2.1}, a program may specialize \texttt{common_type_t<T1, T2>} for types T1 and T2 such that \texttt{is_same_v<T1, decay_t<T1>}} and \texttt{is_same_v<T2, decay_t<T2>}} are each true. \texttt{[Note: Such specializations are needed when only explicit conversions are desired between the template arguments. — end note]} Such a specialization need not have a member named \texttt{type}, but if it does, that member shall be a \texttt{typedef-name} for an accessible and unambiguous cv-unqualified non-reference type C to which each of the types T1 and T2 is explicitly convertible. Moreover, \texttt{common_type_t<T1, T2>} shall denote the same type, if any, as \texttt{common_type_t<T2, T1>}. No diagnostic is required for a violation of this Note’s rules.

Note C: For the \texttt{common_reference} trait applied to a parameter pack T of types, the member \texttt{type} shall be either defined or not present as follows:

1. If \texttt{sizeof...(T)} is zero, there shall be no member \texttt{type}.

2. Otherwise, if \texttt{sizeof...(T)} is one, let T0 denote the sole type in the pack T. The member \texttt{typedef-name type} shall denote the same type as \texttt{T0}.

3. Otherwise, if \texttt{sizeof...(T)} is two, let T1 and T2 denote the two types in the pack T. Then

   - If T1 and T2 are reference types and \texttt{COMMON-REF(T1, T2)} is well-formed, then the member \texttt{typedef type} denotes that type.

   - Otherwise, if \texttt{basic_common_reference<remove_cvref_t<T1>}, remove_cvref_t<T2>, XREF(T1), XREF(T2)::type} is well-formed, then the member \texttt{typedef type} denotes that type.

   - Otherwise, if \texttt{COND-RES(T1, T2)} is well-formed, then the member \texttt{typedef type} denotes that type.

   - Otherwise, if \texttt{common_type_t<T1, T2> is well-formed, then the member \texttt{typedef type} denotes that type.}
Otherwise, there shall be no member type.

Otherwise, if sizeof...(T) is greater than two, let T1, T2, and Rest, respectively, denote the first, second, and (pack of) remaining types comprising T. Let C be the type common_reference_t<T1, T2>. Then:

- If there is such a type C, the member typedef type shall denote the same type, if any, as common_reference_t<C, Rest...>.

- Otherwise, there shall be no member type.

Note D: Notwithstanding the provisions of 20.15.2, and pursuant to 16.5.4.2.1, a program may partially specialize basic_common_reference<T, U, TQual, UQual> for types T and U such that is_same_v<T, decay_t<T>> and is_same_v<U, decay_t<U>> are each true. [Note: Such specializations can be used to influence the result of common_reference, and are needed when only explicit conversions are desired between the template arguments. — end note] Such a specialization need not have a member named type, but if it does, that member shall be a typedef-name for an accessible and unambiguous type C to which each of the types TQual<T> and UQual< U> is convertible. Moreover, basic_common_reference<T, U, TQual, UQual>::type shall denote the same type, if any, as does basic_common_reference<U, T, UQual, TQual>::type. No diagnostic is required for a violation of these rules.

Example: Given these definitions:

```cpp
using PF1 = bool (&)();
using PF2 = short (*)(long);
struct S {
    operator PF2() const;
    double operator() (char, int&);
    void fn(long) const;
    char data;
};
using PMF = void (S::*)(long) const;
using PMD = char S::*;
```

the following assertions will hold:

- static_assert(is_same_v<invoke_result_t<S, int>, short>);
- static_assert(is_same_v<invoke_result_t<S&, unsigned char, int&>, double>);
- static_assert(is_same_v<invoke_result_t<PF1, bool>>);
- static_assert(is_same_v<invoke_result_t<PMF, unique_ptr<S>, int, void>>);
- static_assert(is_same_v<invoke_result_t<PMF, S*, char&&>>);
- static_assert(is_same_v<invoke_result_t<PMF, const S*, const char&>>);

---

20.15.8 Logical operator traits [meta.logical]

This subclause describes type traits for applying logical operators to other type traits.

```cpp
template<class... B> struct conjunction : see below {};
```

The class template conjunction forms the logical conjunction of its template type arguments.

For a specialization conjunction<B1, ..., BN>, if there is a template type argument B_i for which bool(B_i::value) is false, then instantiating conjunction<B1, ..., BN>::value does not require the instantiation of B_j::value for j > i. [Note: This is analogous to the short-circuiting behavior of the built-in operator &&. — end note]

Every template type argument for which B_i::value is instantiated shall be usable as a base class and shall have a member value which is convertible to bool, is not hidden, and is unambiguously available in the type.

The specialization conjunction<B1, ..., BN> has a public and unambiguous base that is either

- the first type B_i in the list true_type, B1, ..., BN for which bool(B_i::value) is false, or
- if there is no such B_i, the last type in the list.
The member names of the base class, other than conjunction and operator=, shall not be hidden and shall be unambiguously available in conjunction.

template<class... B> struct disjunction : see below { }; 

The class template disjunction forms the logical disjunction of its template type arguments.

For a specialization disjunction<B₁, ..., Bₙ>, if there is a template type argument Bᵢ for which bool(Bᵢ::value) is true, then instantiating disjunction<B₁, ..., Bₙ>::value does not require the instantiation of Bⱼ::value for j > i. [Note: This is analogous to the short-circuiting behavior of the built-in operator ||. — end note]

Every template type argument for which Bᵢ::value is instantiated shall be usable as a base class and shall have a member value which is convertible to bool, is not hidden, and is unambiguously available in the type.

The specialization disjunction<B₁, ..., Bₙ> has a public and unambiguous base that is either

(10.1)  — the first type Bᵢ in the list false_type, B₁, ..., Bₙ for which bool(Bᵢ::value) is true, or
(10.2)  — if there is no such Bᵢ, the last type in the list. 

[Note: This means a specialization of disjunction does not necessarily inherit from either true_type or false_type. — end note]

The member names of the base class, other than disjunction and operator=, shall not be hidden and shall be unambiguously available in disjunction.

template<class B> struct negation : see below { }; 

The class template negation forms the logical negation of its template type argument. The type negation<B> is a Cpp17UnaryTypeTrait with a base characteristic of bool_constant<!bool(B::value)>.

20.15.9 Member relationships [meta.member]

template<class S, class M>
constexpr bool is_pointer_interconvertible_with_class(M S::*m) noexcept; 

1  Mandates: S is a complete type.
2  Returns: true if and only if S is a standard-layout type, M is an object type, m is not null, and each object s of type S is pointer-interconvertible (6.8.2) with its subobject s.*m.

template<class S1, class S2, class M1, class M2>
constexpr bool is_corresponding_member(M1 S1::*m1, M2 S2::*m2) noexcept;

3  Mandates: S1 and S2 are complete types.
4  Returns: true if and only if S1 and S2 are standard-layout types, M1 and M2 are object types, m₁ and m₂ are not null, and m₁ and m₂ point to corresponding members of the common initial sequence (11.4) of S₁ and S₂.

5  [Note: The type of a pointer-to-member expression &C::*b is not always a pointer to member of C, leading to potentially surprising results when using these functions in conjunction with inheritance. [Example:

struct A { int a; }; // a standard-layout class
struct B { int b; }; // a standard-layout class
struct C: public A, public B { }; // not a standard-layout class

static_assert( is_pointer_interconvertible_with_class( &C::*b ) ); // Succeeds because, despite its appearance, &C::*b has type "pointer to member of B of type int."
static_assert( is_pointer_interconvertible_with_class<C>( &C::*b ) ); // Forcces the use of class C, and fails.

static_assert( is_corresponding_member( &C::*a, &C::*b ) );
20.15.10 Constant evaluation context

```cpp
constexpr bool is_constant_evaluated() noexcept;

Returns: true if and only if evaluation of the call occurs within the evaluation of an expression or conversion that is manifestly constant-evaluated (7.7).
```

[Example:
```cpp
constexpr void f(unsigned char *p, int n) {
  if (std::is_constant_evaluated()) {
    // should not be a constexpr if statement
    for (int k = 0; k<n; ++k) p[k] = 0;
  } else {
    memset(p, 0, n);        // not a core constant expression
  }
}
```

—end example] — end note]
template<class R1, class R2>
inline constexpr bool ratio_greater_equal_v = ratio_greater_equal<R1, R2>::value;

// 20.16.6. convenience SI typedefs
using yocto = ratio<1, 1'000'000'000'000'000'000'000'000>; // see below
using zepto = ratio<1, 1'000'000'000'000'000'000'000'000>; // see below
using atto = ratio<1, 1'000'000'000'000'000'000'; // see below
using femto = ratio<1, 1'000'000'; // see below
using pico = ratio<1, 1'000'; // see below
using nano = ratio<1, 100'; // see below
using micro = ratio<1, 10'; // see below
using milli = ratio<1, 1'; // see below
using centi = ratio<1, 0'; // see below
using deci = ratio<1, 1/10'; // see below
using deca = ratio<1, 1/100'; // see below
using hecto = ratio<1, 1/1000'; // see below
using kilo = ratio<1, 1/10000'; // see below
using mega = ratio<1, 1/100000'; // see below
using giga = ratio<1, 1/1000000'; // see below
using tera = ratio<1, 1/10000000'; // see below
using peta = ratio<1, 1/100000000'; // see below
using exa = ratio<1, 1/1000000000'; // see below
using zetta = ratio<1, 1/10000000000'; // see below
using yotta = ratio<1, 1/100000000000'; // see below

20.16.3 Class template ratio [ratio.ratio]
namespace std {
    template<intmax_t N, intmax_t D = 1> class ratio {
    public:
        static constexpr intmax_t num;
        static constexpr intmax_t den;
        using type = ratio<num, den>;
    };
}

1 If the template argument D is zero or the absolute values of either of the template arguments N and D is not representable by type intmax_t, the program is ill-formed. [Note: These rules ensure that infinite ratios are avoided and that for any negative input, there exists a representable value of its absolute value which is positive. This excludes the most negative value. —end note]

2 The static data members num and den shall have the following values, where gcd represents the greatest common divisor of the absolute values of N and D:

(2.1) — num shall have the value sign(N) * sign(D) * abs(N) / gcd.
(2.2) — den shall have the value abs(D) / gcd.

20.16.4 Arithmetic on ratios [ratio.arithmetic]
Each of the alias templates ratio_add, ratio_subtract, ratio_multiply, and ratio_divide denotes the result of an arithmetic computation on two ratios R1 and R2. With X and Y computed (in the absence of arithmetic overflow) as specified by Table 58, each alias denotes a ratio<U, V> such that U is the same as ratio<X, Y>::num and V is the same as ratio<X, Y>::den.

If it is not possible to represent U or V with intmax_t, the program is ill-formed. Otherwise, an implementation should yield correct values of U and V. If it is not possible to represent X or Y with intmax_t, the program is ill-formed unless the implementation yields correct values of U and V.

3 [Example:]
    static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>::num == 1, "1/3+1/6 == 1/2");
    static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>::den == 2, "1/3+1/6 == 1/2");
    static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>::num == 1, "1/3*3/2 == 1/2");
    static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>::den == 2, "1/3*3/2 == 1/2");

</tr>
</tbody>
</table>

// The following cases may cause the program to be ill-formed under some implementations
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>::num == 2, "1/MAX+1/MAX == 2/MAX");
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>::den == INT_MAX, "1/MAX+1/MAX == 2/MAX");
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>::num == 1, "1/MAX * MAX/2 == 1/2");
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>::den == 2, "1/MAX * MAX/2 == 1/2");

—end example

20.16.5 Comparison of ratios

template<class R1, class R2>
struct ratio_equal : bool_constant<R1::num == R2::num && R1::den == R2::den> { };  

template<class R1, class R2>
struct ratio_not_equal : bool_constant!<ratio_equal_v<R1, R2>> { };  

template<class R1, class R2>
struct ratio_less : bool_constant<see below> { };  

1 If R1::num × R2::den is less than R2::num × R1::den, ratio_less<R1, R2> shall be derived from bool_constant<true>; otherwise it shall be derived from bool_constant<false>. Implementations may use other algorithms to compute this relationship to avoid overflow. If overflow occurs, the program is ill-formed.

template<class R1, class R2>
struct ratio_less_equal : bool_constant!<ratio_less_v<R2, R1>> { };  

template<class R1, class R2>
struct ratio_greater : bool_constant<ratio_less_v<R2, R1>> { };  

template<class R1, class R2>
struct ratio_greater_equal : bool_constant!<ratio_less_v<R1, R2>> { };  

20.16.6 SI types for ratio

For each of the typedef-names yocto, zepto, zetta, and yotta, if both of the constants used in its specification are representable by intmax_t, the typedef is defined; if either of the constants is not representable by intmax_t, the typedef is not defined.

20.17 Class type_index

20.17.1 Header <typeindex> synopsis

#include <compare>  // see 17.11.1

namespace std {
    class type_index;
    template<class T> struct hash;
    template<> struct hash<type_index>;
}
20.17.2 type_index overview

```cpp
namespace std {
    class type_index {
        public:
            type_index(const type_info& rhs) noexcept;
            bool operator==(const type_index& rhs) const noexcept;
            bool operator<(const type_index& rhs) const noexcept;
            bool operator>(const type_index& rhs) const noexcept;
            bool operator<=(const type_index& rhs) const noexcept;
            bool operator>=(const type_index& rhs) const noexcept;
            strong_ordering operator<=>(const type_index& rhs) const noexcept;
            size_t hash_code() const noexcept;
            const char* name() const noexcept;
        private:
            const type_info* target; // exposition only
            // Note that the use of a pointer here, rather than a reference,
            // means that the default copy/move constructor and assignment
            // operators will be provided and work as expected.
    };
```

The class `type_index` provides a simple wrapper for `type_info` which can be used as an index type in associative containers (22.4) and in unordered associative containers (22.5).

20.17.3 type_index members

```cpp
type_index(const type_info& rhs) noexcept;
```

1 Effects: Constructs a `type_index` object, the equivalent of `target = &rhs`.

```cpp
bool operator==(const type_index& rhs) const noexcept;
```

2 Returns: `*target == *rhs.target`.

```cpp
bool operator<(const type_index& rhs) const noexcept;
```

3 Returns: `target->before(*rhs.target)`.

```cpp
bool operator>(const type_index& rhs) const noexcept;
```

4 Returns: `rhs.target->before(*target)`.

```cpp
bool operator<=(const type_index& rhs) const noexcept;
```

5 Returns: `!rhs.target->before(*target)`.

```cpp
bool operator>=(const type_index& rhs) const noexcept;
```

6 Returns: `!target->before(*rhs.target)`.

```cpp
strong_ordering operator<=>(const type_index& rhs) const noexcept;
```

7 Effects: Equivalent to:

```cpp
if (*target == *rhs.target) return strong_ordering::equal;
if (target->before(*rhs.target)) return strong_ordering::less;
return strong_ordering::greater;
```

```cpp
size_t hash_code() const noexcept;
```

8 Returns: `target->hash_code()`.

```cpp
const char* name() const noexcept;
```

9 Returns: `target->name()`.
20.17.4 Hash support

template<> struct hash<type_index>;

For an object index of type type_index, hash<type_index>()(index) shall evaluate to the same result as index.hash_code().

20.18 Execution policies

20.18.1 In general

Subclause 20.18 describes classes that are execution policy types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions. [Example:

using namespace std;
vector<int> v = /* ... */;

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(execution::seq, v.begin(), v.end());

// permitting parallel execution
sort(execution::par, v.begin(), v.end());

// permitting vectorization as well
sort(execution::par_unseq, v.begin(), v.end()); —end example] [Note: Because different parallel architectures may require idiosyncratic parameters for efficient execution, implementations may provide additional execution policies to those described in this standard as extensions. —end note]

20.18.2 Header <execution> synopsis

namespace std {
  // 20.18.3, execution policy type trait
  template<class T> struct is_execution_policy;
  template<class T> inline constexpr bool is_execution_policy_v = is_execution_policy<T>::value;
}

namespace std::execution {
  // 20.18.4, sequenced execution policy
  class sequenced_policy;

  // 20.18.5, parallel execution policy
  class parallel_policy;

  // 20.18.6, parallel and unsequenced execution policy
  class parallel_unsequenced_policy;

  // 20.18.7, unsequenced execution policy
  class unsequenced_policy;

  // 20.18.8, execution policy objects
  inline constexpr sequenced_policy seq{ unspecified };  
  inline constexpr parallel_policy par{ unspecified };

  inline constexpr unsequenced_policy unseq{ unspecified }; 
}

20.18.3 Execution policy type trait

template<class T> struct is_execution_policy { see below };
is_execution_policy\lt T\gt \text{ is a Cpp17UnaryTypeTrait with a base characteristic of true_type if } T \text{ is the type of a standard or implementation-defined execution policy, otherwise false_type.}

[Note: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — end note]

The behavior of a program that adds specializations for \texttt{is_execution_policy} is undefined.

20.18.4 Sequenced execution policy

\begin{verbatim}
20.18.4 Sequenced execution policy [execpol.seq]

class execution::sequenced_policy { unspecified }; 1

The class \texttt{execution::sequenced_policy} is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm’s execution may not be parallelized.

2 During the execution of a parallel algorithm with the \texttt{execution::sequenced_policy} policy, if the invocation of an element access function exits via an uncaught exception, \texttt{terminate()} is called.
\end{verbatim}

20.18.5 Parallel execution policy

\begin{verbatim}
20.18.5 Parallel execution policy [execpol.par]

class execution::parallel_policy { unspecified }; 1

The class \texttt{execution::parallel_policy} is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

2 During the execution of a parallel algorithm with the \texttt{execution::parallel_policy} policy, if the invocation of an element access function exits via an uncaught exception, \texttt{terminate()} is called.
\end{verbatim}

20.18.6 Parallel and unsequenced execution policy

\begin{verbatim}
20.18.6 Parallel and unsequenced execution policy [execpol.parunseq]

class execution::parallel_unsequenced_policy { unspecified }; 1

The class \texttt{execution::parallel_unsequenced_policy} is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

2 During the execution of a parallel algorithm with the \texttt{execution::parallel_unsequenced_policy} policy, if the invocation of an element access function exits via an uncaught exception, \texttt{terminate()} is called.
\end{verbatim}

20.18.7 Unsequenced execution policy

\begin{verbatim}
20.18.7 Unsequenced execution policy [execpol.unseq]

class execution::unsequenced_policy { unspecified }; 1

The class \texttt{unsequenced_policy} is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be vectorized, e.g., executed on a single thread using instructions that operate on multiple data items.

2 During the execution of a parallel algorithm with the \texttt{execution::unsequenced_policy} policy, if the invocation of an element access function exits via an uncaught exception, \texttt{terminate()} is called.
\end{verbatim}

20.18.8 Execution policy objects

\begin{verbatim}
20.18.8 Execution policy objects [execpol.objects]

inline constexpr execution::sequenced_policy execution::seq{ unspecified }; 1
inline constexpr execution::parallel_policy execution::par{ unspecified }; 1
inline constexpr execution::parallel_unsequenced_policy execution::par_unseq{ unspecified }; 1
inline constexpr execution::unsequenced_policy execution::unseq{ unspecified }; 1

The header \texttt{<execution>} declares global objects associated with each type of execution policy.
\end{verbatim}

20.19 Primitive numeric conversions

20.19.1 Header \texttt{<charconv>} synopsis

\begin{verbatim}
20.19.1 Header \texttt{<charconv>} synopsis [charconv.syn]

namespace std {

namespace std {

// floating-point format for primitive numerical conversion
enum class chars_format {
scientific = unspecified,
fixed = unspecified,
\end{verbatim}

\textcopyright ISO/IEC 2020 – All rights reserved 718
The type \texttt{chars\_format} is a bitmask type (16.4.2.2.4) with elements \texttt{scientific}, \texttt{fixed}, and \texttt{hex}.

The types \texttt{to\_chars\_result} and \texttt{from\_chars\_result} have the data members and special members specified above. They have no base classes or members other than those specified.

\textbf{20.19.2 Primitive numeric output conversion} \hfill [charconv.to.chars]

All functions named \texttt{to\_chars} convert \texttt{value} into a character string by successively filling the range \texttt{[first, last)}, where \texttt{[first, last)} is required to be a valid range. If the member \texttt{ec} of the return value is such that the value is equal to the value of a value-initialized \texttt{errc}, the conversion was successful and the member \texttt{ptr} is the one-past-the-end pointer of the characters written. Otherwise, the member \texttt{ec} has the value \texttt{errc::value\_too\_large}, the member \texttt{ptr} has the value \texttt{last}, and the contents of the range \texttt{[first, last)} are unspecified.

The functions that take a floating-point \texttt{value} but not a \texttt{precision} parameter ensure that the string representation consists of the smallest number of characters such that there is at least one digit before the radix point (if present) and parsing the representation using the corresponding \texttt{from\_chars} function recovers \texttt{value} exactly. [\textit{Note:} This guarantee applies only if \texttt{to\_chars} and \texttt{from\_chars} are executed on the same
implementation. — end note] If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to round_to_nearest (17.3.4.1).

The functions taking a chars_format parameter determine the conversion specifier for printf as follows: The conversion specifier is f if fmt is chars_format::fixed, e if fmt is chars_format::scientific, a (without leading "0x" in the result) if fmt is chars_format::hex, and g if fmt is chars_format::general.

to_chars_result to_chars(char* first, char* last, see below value, int base = 10);

Preconditions: base has a value between 2 and 36 (inclusive).

Effects: The value of value is converted to a string of digits in the given base (with no redundant leading zeroes). Digits in the range 10..35 (inclusive) are represented as lowercase characters a..z. If value is less than zero, the representation starts with '-'.

Throws: Nothing.

Remarks: The implementation shall provide overloads for all signed and unsigned integer types and char as the type of the parameter value.

to_chars_result to_chars(char* first, char* last, float value);
to_chars_result to_chars(char* first, char* last, double value);
to_chars_result to_chars(char* first, char* last, long double value);

Effects: value is converted to a string in the style of printf in the "C" locale. The conversion specifier is f or e, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of f.

Throws: Nothing.

Remarks: value is converted to a string in the style of printf in the "C" locale.

Throws: Nothing.

to_chars_result to_chars(char* first, char* last, float value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, double value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt);

Preconditions: fmt has the value of one of the enumerators of chars_format.

Effects: value is converted to a string in the style of printf in the "C" locale.

Throws: Nothing.

to_chars_result to_chars(char* first, char* last, float value, chars_format fmt, int precision);
to_chars_result to_chars(char* first, char* last, double value, chars_format fmt, int precision);
to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt, int precision);

Preconditions: fmt has the value of one of the enumerators of chars_format.

Effects: value is converted to a string in the style of printf in the "C" locale with the given precision.

Throws: Nothing.

See also: ISO C 7.21.6.1

20.19.3 Primitive numeric input conversion [charconv.from.chars]

All functions named from_chars analyze the string [first, last) for a pattern, where [first, last) is required to be a valid range. If no characters match the pattern, value is unmodified, the member ptr of the return value is first and the member ec is equal to errc::invalid_argument. [Note: If the pattern allows for an optional sign, but the string has no digit characters following the sign, no characters match the pattern. — end note] Otherwise, the characters matching the pattern are interpreted as a representation of a value of the type of value. The member ptr of the return value points to the first character not matching the pattern, or has the value last if all characters match. If the parsed value is not in the range representable by the type of value, value is unmodified and the member ec of the return value is equal to errc::result_out_of_range. Otherwise, value is set to the parsed value, after rounding according to round_to_nearest (17.3.4.1), and the member ec is value-initialized.
from_chars_result from_chars(const char* first, const char* last, 
    & value, int base = 10);

Preconditions: base has a value between 2 and 36 (inclusive).

Effects: The pattern is the expected form of the subject sequence in the "C" locale for the given nonzero base, as described for `strtol`, except that no "0x" or "0X" prefix shall appear if the value of base is 16, and except that '-' is the only sign that may appear, and only if `value` has a signed type.

Throws: Nothing.

Remarks: The implementation shall provide overloads for all signed and unsigned integer types and char as the referenced type of the parameter `value`.

from_chars_result from_chars(const char* first, const char* last, float& value, 
    chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, double& value, 
    chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, long double& value, 
    chars_format fmt = chars_format::general);

Preconditions: fmt has the value of one of the enumerators of chars_format.

Effects: The pattern is the expected form of the subject sequence in the "C" locale, as described for `strtod`, except that

1. the sign '+' may only appear in the exponent part;
2. if fmt has chars_format::scientific set but not chars_format::fixed, the otherwise optional exponent part shall appear;
3. if fmt has chars_format::fixed set but not chars_format::scientific, the optional exponent part shall not appear; and
4. if fmt is chars_format::hex, the prefix "0x" or "0X" is assumed. [Example: The string 0x123 is parsed to have the value 0 with remaining characters x123. — end example]

In any case, the resulting value is one of at most two floating-point values closest to the value of the string matching the pattern.

Throws: Nothing.

20.20.2 Format string

20.20.2.1 In general

A format string for arguments `args` is a (possibly empty) sequence of replacement fields, escape sequences, and characters other than `{` and `}`. Let `charT` be the character type of the format string. Each character that is not part of a replacement field or an escape sequence is copied unchanged to the output. An escape sequence is one of `{`, or `}`. It is replaced with `{` or `}`, respectively, in the output. The syntax of replacement fields is as follows:

replacement-field:

```
{ arg-id_opt format-specifier_opt }
```

arg-id:

```
0
```

positive-integer

nonzero-digit

positive-integer digit

nonnegative-integer:

digit

nonnegative-integer digit

nonzero-digit: one of

```
1 2 3 4 5 6 7 8 9
```

digit: one of

```
0 1 2 3 4 5 6 7 8 9
```

format-specifier:

```
: format-spec
```

format-spec:

as specified by the `formatter` specialization for the argument type

The `arg-id` field specifies the index of the argument in `args` whose value is to be formatted and inserted into the output instead of the replacement field. If there is no argument with the index `arg-id` in `args`, the string is not a format string for `args`. The optional `format-specifier` field explicitly specifies a format for the replacement value.

[Example:

```
string s = format("{:0}-{", 8); // value of s is "8-{""
```]
If all `arg-id`s in a format string are omitted (including those in the `format-spec`, as interpreted by the corresponding `formatter` specialization), argument indices 0, 1, 2, ... will automatically be used in that order. If some `arg-id`s are omitted and some are present, the string is not a format string. [Note: A format string cannot contain a mixture of automatic and manual indexing. — end note] [Example:

```cpp
string s0 = format("{} to {}", "a", "b"); // OK, automatic indexing
string s1 = format("{} to {}", "a", "b"); // OK, manual indexing
string s2 = format("{} to {}", "a", "b"); // not a format string (mixing automatic and manual indexing),
    // throws `format_error`
string s3 = format("{} to {}", "a", "b"); // not a format string (mixing automatic and manual indexing),
    // throws `format_error`
```

— end example]

The `format-spec` field contains `format specifications` that define how the value should be presented. Each type can define its own interpretation of the `format-spec` field. If `format-spec` does not conform to the format specifications for the argument type referred to by `arg-id`, the string is not a format string for `args`. [Example:

(5.1) — For arithmetic, pointer, and string types the `format-spec` is interpreted as a `std-format-spec` as described in (20.20.2.2).

(5.2) — For chrono types the `format-spec` is interpreted as a `chrono-format-spec` as described in (27.12).

(5.3) — For user-defined `formatter` specializations, the behavior of the `parse` member function determines how the `format-spec` is interpreted.

— end example]

### 20.20.2.2 Standard format specifiers

Each `formatter` specializations described in 20.20.5.2 for fundamental and string types interprets `format-spec` as a `std-format-spec`. [Note: The format specification can be used to specify such details as field width, alignment, padding, and decimal precision. Some of the formatting options are only supported for arithmetic types. — end note] The syntax of format specifications is as follows:

```
std-format-spec:
    fill-and-align_opt sign_opt #opt 0opt width_opt precision_opt Lopt type_opt

fill-and-align:
    fill_opt align

fill:
    any character other than \{ or \}

align: one of
    < > ^

sign: one of
    + - space

width:
    positive-integer
    \{ arg-id_opt \}

precision:
    nonnegative-integer
    . \{ arg-id_opt \}

type: one of
    a A b B c d e E f F g G o p s x X
```

[Note: The `fill` character can be any character other than \{ or \}. The presence of a fill character is signaled by the character following it, which must be one of the alignment options. If the second character of `std-format-spec` is not a valid alignment option, then it is assumed that both the fill character and the alignment option are absent. — end note]

The `align` specifier applies to all argument types. The meaning of the various alignment options is as specified in Table 59. [Example:

```cpp
char c = 120;

string s0 = format("{:6}", 42); // value of s0 is " 42"
string s1 = format("{:6}", 'x'); // value of s1 is " x"
```
string s2 = format("{:*<6}", 'x'); // value of s2 is "x*****"
string s3 = format("{:*>6}", 'x'); // value of s3 is "*****x"
string s4 = format("{:*^6}", 'x'); // value of s4 is "**x***"
string s5 = format("{:6d}", c); // value of s5 is " 120"
string s6 = format("{:6}", true); // value of s6 is "true ")

—end example] [Note: Unless a minimum field width is defined, the field width is determined by the size of the content and the alignment option has no effect. — end note]

Table 59: Meaning of align options [tab:format.align]

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;</td>
<td>Forces the field to be aligned to the start of the available space. This is the default for non-arithmetic types, charT, and bool, unless an integer presentation type is specified.</td>
</tr>
<tr>
<td>&gt;</td>
<td>Forces the field to be aligned to the end of the available space. This is the default for arithmetic types other than charT and bool or when an integer presentation type is specified.</td>
</tr>
<tr>
<td>-</td>
<td>Forces the field to be centered within the available space by inserting ( \lfloor \frac{n}{2} \rfloor ) characters before and ( \lceil \frac{n}{2} \rceil ) characters after the value, where ( n ) is the total number of fill characters to insert.</td>
</tr>
</tbody>
</table>

4 The sign option is only valid for arithmetic types other than charT and bool or when an integer presentation type is specified. The meaning of the various options is as specified in Table 60.

Table 60: Meaning of sign options [tab:format.sign]

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>Indicates that a sign should be used for both non-negative and negative numbers. The + sign is inserted before the output of to_chars for non-negative numbers other than negative zero. [Note: For negative numbers and negative zero the output of to_chars will already contain the sign so no additional transformation is performed. — end note]</td>
</tr>
<tr>
<td>-</td>
<td>Indicates that a sign should be used for negative numbers and negative zero only (this is the default behavior).</td>
</tr>
<tr>
<td>space</td>
<td>Indicates that a leading space should be used for non-negative numbers other than negative zero, and a minus sign for negative numbers and negative zero.</td>
</tr>
</tbody>
</table>

5 The sign option applies to floating-point infinity and NaN. [Example:

double inf = numeric_limits<double>::infinity();
double nan = numeric_limits<double>::quiet_NaN();
string s0 = format("{0:},{0:+},{0:-},{0: }", 1); // value of s0 is "1,+1,1, 1"
string s1 = format("{0:},{0:+},{0:-},{0: }", -1); // value of s1 is "-1,-1,-1,-1"
string s2 = format("{0:},{0:+},{0:-},{0: }", inf); // value of s2 is "inf,+inf,inf, inf"
string s3 = format("{0:},{0:+},{0:-},{0: }", nan); // value of s3 is "nan,*nan,nan, nan"

—end example]

6 The # option causes the alternate form to be used for the conversion. This option is valid for arithmetic types other than charT and bool or when an integer presentation type is specified, and not otherwise. For integral types, the alternate form inserts the base prefix (if any) specified in Table 62 into the output after the sign character (possibly space) if there is one, or before the output of to_chars otherwise. For floating-point types, the alternate form causes the result of the conversion of finite values to always contain a decimal-point character, even if no digits follow it. Normally, a decimal-point character appears in the result of these conversions only if a digit follows it. In addition, for g and G conversions, trailing zeros are not removed from the result.

7 If \{ arg-id-opt \} is used in a width or precision, the value of the corresponding formatting argument is used in its place. If the corresponding formatting argument is not of integral type, or its value is negative for precision or non-positive for width, an exception of type format_error is thrown.

8 The positive-integer in width is a decimal integer defining the minimum field width. If width is not specified, there is no minimum field width, and the field width is determined based on the content of the field.
The width of a string is defined as the estimated number of column positions appropriate for displaying it in a terminal. [Note: This is similar to the semantics of the POSIX \texttt{wcswidth} function. — end note]

For the purposes of width computation, a string is assumed to be in a locale-independent, implementation-defined encoding. Implementations should use a Unicode encoding on platforms capable of displaying Unicode text in a terminal. [Note: This is the case for Windows-based and many POSIX-based operating systems. — end note]

For a string in a Unicode encoding, implementations should estimate the width of a string as the sum of estimated widths of the first code points in its extended grapheme clusters. The extended grapheme clusters of a string are defined by UAX #29. The estimated width of the following code points is 2:

- U+1100-U+115F
- U+2329-U+232A
- U+2E80-U+303E
- U+3040-U+A4CF
- U+AC00-U+D7A3
- U+F900-U+FAFF
- U+FE10-U+FE19
- U+FE30-U+FE6F
- U+FF00-U+FF60
- U+30000-U+3FFFD

The estimated width of other code points is 1.

For a string in a non-Unicode encoding, the width of a string is unspecified.

A zero (0) character preceding the width field pads the field with leading zeros (following any indication of sign or base) to the field width, except when applied to an infinity or NaN. This option is only valid for arithmetic types other than \texttt{charT} and \texttt{bool} or when an integer presentation type is specified. If the 0 character and an align option both appear, the 0 character is ignored. [Example:

```cpp
char c = 120;
string s1 = format("{:+06d}", c); // value of s1 is "+00120"
string s2 = format("{:06x}", 0xa); // value of s2 is "0x000a"
string s3 = format("{:<06}", -42); // value of s3 is "-42 " (0 is ignored because of < alignment)
```

The nonnegative-integer in precision is a decimal integer defining the precision or maximum field size. It can only be used with floating-point and string types. For floating-point types this field specifies the formatting precision. For string types, this field provides an upper bound for the estimated width of the prefix of the input string that is copied into the output. For a string in a Unicode encoding, the formatter copies to the output the longest prefix of whole extended grapheme clusters whose estimated width is no greater than the precision.

When the L option is used, the form used for the conversion is called the locale-specific form. The L option is only valid for arithmetic types, and its effect depends upon the type.

- For integral types, the locale-specific form causes the context’s locale to be used to insert the appropriate digit group separator characters.
- For floating-point types, the locale-specific form causes the context’s locale to be used to insert the appropriate digit group and radix separator characters.
- For the textual representation of \texttt{bool}, the locale-specific form causes the context’s locale to be used to insert the appropriate string as if obtained with \texttt{numpunct::truename} or \texttt{numpunct::falsename}.

The type determines how the data should be presented.
The available string presentation types are specified in Table 61.

<table>
<thead>
<tr>
<th>Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none, s</td>
<td>Copies the string to the output.</td>
</tr>
</tbody>
</table>

The meaning of some non-string presentation types is defined in terms of a call to `to_chars`. In such cases, let \([\text{first}, \text{last})\) be a range large enough to hold the `to_chars` output and \(\text{value}\) be the formatting argument value. Formatting is done as if by calling `to_chars` as specified and copying the output through the output iterator of the format context. [Note: Additional padding and adjustments are performed prior to copying the output through the output iterator as specified by the format specifiers. — end note]

The available integer presentation types for integral types other than `bool` and `charT` are specified in Table 62.

<table>
<thead>
<tr>
<th>Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td><code>to_chars(\text{first}, \text{last}, \text{value}, 2)</code>; the base prefix is 0b.</td>
</tr>
<tr>
<td>B</td>
<td>The same as b, except that the base prefix is 0B.</td>
</tr>
<tr>
<td>c</td>
<td>Copies the character <code>\text{static\_cast&lt;\text{charT}}(\text{value})</code> to the output. Throws <code>format\_error</code> if value is not in the range of representable values for <code>charT</code>.</td>
</tr>
<tr>
<td>d</td>
<td><code>to_chars(\text{first}, \text{last}, \text{value})</code>.</td>
</tr>
<tr>
<td>o</td>
<td><code>to_chars(\text{first}, \text{last}, \text{value}, 8)</code>; the base prefix is 0 if value is nonzero and is empty otherwise.</td>
</tr>
<tr>
<td>x</td>
<td><code>to_chars(\text{first}, \text{last}, \text{value}, 16)</code>; the base prefix is 0x.</td>
</tr>
<tr>
<td>X</td>
<td>The same as x, except that it uses uppercase letters for digits above 9 and the base prefix is 0X.</td>
</tr>
<tr>
<td>none</td>
<td>The same as d. [Note: If the formatting argument type is <code>charT</code> or <code>bool</code>, the default is instead c or s, respectively. — end note]</td>
</tr>

     | with the prefix 0x added to the output; otherwise, implementation-defined. |

20.20.3 Error reporting  

Formatting functions throw format_error if an argument fmt is passed that is not a format string for args. They propagate exceptions thrown by operations of formatter specializations and iterators. Failure to allocate storage is reported by throwing an exception as described in 16.5.5.13.

20.20.4 Formatting functions  

In the description of the functions, operator + is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of a + n are the same as in 25.2.

> template<class... Args> 
> string format(string_view fmt, const Args&... args);  
> Effects: Equivalent to:  
> return vformat(fmt, make_format_args(args...));
template<class... Args>
wstring format(wstring_view fmt, const Args&... args);

Effects: Equivalent to:
return vformat(fmt, make_wformat_args(args...));

template<class... Args>
string format(const locale& loc, string_view fmt, const Args&... args);

Effects: Equivalent to:
return vformat(loc, fmt, make_format_args(args...));

template<class... Args>
wstring format(const locale& loc, wstring_view fmt, const Args&... args);

Effects: Equivalent to:
return vformat(loc, fmt, make_wformat_args(args...));

string vformat(string_view fmt, format_args args);
wstring vformat(wstring_view fmt, wformat_args args);
string vformat(const locale& loc, string_view fmt, format_args args);
wstring vformat(const locale& loc, wstring_view fmt, wformat_args args);

Returns: A string object holding the character representation of formatting arguments provided by args formatted according to specifications given in fmt. If present, loc is used for locale-specific formatting.

Throws: As specified in 20.20.3.

template<class Out, class... Args>
Out format_to(Out out, string_view fmt, const Args&... args);

Effects: Equivalent to:
using context = basic_format_context<Out, decltype(fmt)::value_type>
return vformat_to(out, fmt, make_format_args<context>(args...));

template<class Out, class... Args>
Out format_to(Out out, wstring_view fmt, const Args&... args);

Effects: Equivalent to:
using context = basic_format_context<Out, decltype(fmt)::value_type>
return vformat_to(out, loc, fmt, make_format_args<context>(args...));

template<class Out>
Out vformat_to(Out out, string_view fmt,
format_args_t<type_identity_t<Out>, char> args);

template<class Out>
Out vformat_to(Out out, wstring_view fmt,
format_args_t<type_identity_t<Out>, wchar_t> args);

template<class Out>
Out vformat_to(Out out, const locale& loc, string_view fmt,
format_args_t<type_identity_t<Out>, char> args);

template<class Out>
Out vformat_to(Out out, const locale& loc, wstring_view fmt,
format_args_t<type_identity_t<Out>, wchar_t> args);

Let charT be decltype(fmt)::value_type.
Constraints: Out satisfies output_iterator<const charT>.
Preconditions: Out models output_iterator<const charT>.
Effects: Places the character representation of formatting the arguments provided by args, formatted according to the specifications given in fmt, into the range [out, out + N), where N is formatted_
size(fmt, args...) for the functions without a loc parameter and formatted_size(loc, fmt, args...) for the functions with a loc parameter. If present, loc is used for locale-specific formatting.

Returns: out + N.

Throws: As specified in 20.20.3.

template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
string_view fmt, const Args&... args);

template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
wstring_view fmt, const Args&... args);

template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
const locale& loc, string_view fmt,
const Args&... args);

template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
const locale& loc, wstring_view fmt,
const Args&... args);

Let

(16.1) charT be decltype(fmt)::value_type,
(16.2) N be formatted_size(fmt, args...) for the functions without a loc parameter and formatted_size(loc, fmt, args...) for the functions with a loc parameter, and
(16.3) M be clamp(n, 0, N).

Constraints: Out satisfies output_iterator<const charT&>.

Preconditions: Out models output_iterator<const charT&>, and formatter<Ti, charT> meets the Formatter requirements (20.20.5.1) for each Ti in Args.

Effects: Places the first M characters of the character representation of formatting the arguments provided by args, formatted according to the specifications given in fmt, into the range [out, out + N). If present, loc is used for locale-specific formatting.

Returns: {out + M, N}.

Throws: As specified in 20.20.3.

template<class... Args>
size_t formatted_size(string_view fmt, const Args&... args);

template<class... Args>
size_t formatted_size(wstring_view fmt, const Args&... args);

template<class... Args>
size_t formatted_size(const locale& loc, string_view fmt, const Args&... args);

template<class... Args>
size_t formatted_size(const locale& loc, wstring_view fmt, const Args&... args);

Let charT be decltype(fmt)::value_type.

Preconditions: formatter<Ti, charT> meets the Formatter requirements (20.20.5.1) for each Ti in Args.

Returns: The number of characters in the character representation of formatting arguments args formatted according to specifications given in fmt. If present, loc is used for locale-specific formatting.

Throws: As specified in 20.20.3.

20.20.5 Formatter

20.20.5.1 Formatter requirements

A type F meets the Formatter requirements if:

(1.1) it meets the
(1.1.1) Cpp17DefaultConstructible (Table 27),
(1.1.2) Cpp17CopyConstructible (Table 29),
— Cpp17CopyAssignable (Table 31), and
— Cpp17Destructible (Table 32)
requirements,
— it is swappable (16.5.3.2) for lvalues, and
— the expressions shown in Table 67 are valid and have the indicated semantics.

Given character type charT, output iterator type Out, and formatting argument type T, in Table 67:
— f is a value of type F,
— u is an lvalue of type T,
— t is a value of a type convertible to (possibly const) T,
— PC is basic_format_parse_context<charT>,
— FC is basic_format_context<Out, charT>,
— pc is an lvalue of type PC, and
— fc is an lvalue of type FC.

pc.begin() points to the beginning of the format-spec (20.20.2) of the replacement field being formatted in the format string. If format-spec is empty then either pc.begin() == pc.end() or *pc.begin() == '}'.

Table 67: Formatter requirements

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>f.parse(pc)</td>
<td>PC::iterator</td>
<td>Parses format-spec (20.20.2) for type T in the range [pc.begin(), pc.end()]) until the first unmatched character. Throws format_error unless the whole range is parsed or the unmatched character is }. [Note: This allows formatters to emit meaningful error messages. — end note] Stores the parsed format specifiers in *this and returns an iterator past the end of the parsed range.</td>
</tr>
<tr>
<td>f.format(t, fc)</td>
<td>FC::iterator</td>
<td>Formats t according to the specifiers stored in *this, writes the output to fc.out() and returns an iterator past the end of the output range. The output shall only depend on t, fc.locale(), and the range [pc.begin(), pc.end()]) from the last call to f.parse(pc).</td>
</tr>
<tr>
<td>f.format(u, fc)</td>
<td>FC::iterator</td>
<td>As above, but does not modify u.</td>
</tr>
</tbody>
</table>

20.20.5.2 Formatter specializations

The functions defined in 20.20.4 use specializations of the class template formatter to format individual arguments.

Let charT be either char or wchar_t. Each specialization of formatter is either enabled or disabled, as described below. [Note: Enabled specializations meet the Formatter requirements, and disabled specializations do not. — end note] Each header that declares the template formatter provides the following enabled specializations:

— The specializations
  template<> struct formatter<char, char>;
  template<> struct formatter<char, wchar_t>;
  template<> struct formatter<wchar_t, wchar_t>;

— For each charT, the string type specializations
  template<> struct formatter<charT*, charT>;
  template<> struct formatter<const charT*, charT>;
  template<size_t N> struct formatter<const char charT[N], charT>;

§ 20.20.5.2 ©ISO/IEC 2020 – All rights reserved 731
template<class traits, class Allocator>
struct formatter<basic_string<charT, traits, Allocator>, charT>;

template<class traits>
struct formatter<basic_string_view<charT, traits>, charT>;

(2.3) For each charT, for each cv-unqualified arithmetic type ArithmeticT other than char, wchar_t, char8_t, char16_t, or char32_t, a specialization

template<> struct formatter<ArithmeticT, charT>;

(2.4) For each charT, the pointer type specializations

template<> struct formatter<nullptr_t, charT>;
template<> struct formatter<void*, charT>;
template<> struct formatter<const void*, charT>;

The parse member functions of these formatters interpret the format specification as a std-format-spec as described in 20.20.2.2. [Note: Specializations such as formatter<wchar_t, char> and formatter<const char*, wchar_t> that would require implicit multibyte / wide string or character conversion are disabled. —end note]

3 For any types T and charT for which neither the library nor the user provides an explicit or partial specialization of the class template formatter, formatter<T, charT> is disabled.

4 If the library provides an explicit or partial specialization of formatter<T, charT>, that specialization is enabled except as noted otherwise.

5 If F is a disabled specialization of formatter, these values are false:

(5.1) is_default_constructible_v<F>,
(5.2) is_copy_constructible_v<F>,
(5.3) is_move_constructible_v<F>,
(5.4) is_copy_assignable_v<F>, and
(5.5) is_move_assignable_v<F>.

6 An enabled specialization formatter<T, charT> meets the Formatter requirements (20.20.5.1). [Example:

```cpp
#include <format>

enum color { red, green, blue };  
const char* color_names[] = { "red", "green", "blue" };  

template<> struct std::formatter<color> : std::formatter<const char*> {
    auto format(color c, format_context& ctx) {
        return formatter<const char*>::format(color_names[c], ctx);
    }
};

struct err {};  

std::string s0 = std::format("{}", 42); // OK, library-provided formatter  
std::string s1 = std::format("{}", L"foo"); // error: disabled formatter  
std::string s2 = std::format("{}", red);  // OK, user-provided formatter  
std::string s3 = std::format("{}", err()); // error: disabled formatter
```

—end example]

20.20.5.3 Class template basic_format_parse_context [format.parse.ctx]

namespace std {

    template<class charT>
    class basic_format_parse_context {
        public:
            using char_type = charT;
            using const_iterator = typename basic_string_view<charT>::const_iterator;
            using iterator = const_iterator;

            private:
                iterator begin_; // exposition only

    };

§ 20.20.5.3 ©ISO/IEC 2020 – All rights reserved 732
An instance of `basic_format_parse_context` holds the format string parsing state consisting of the format string range being parsed and the argument counter for automatic indexing.

```
constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
size_t num_args = 0) noexcept;
```

**Effects:** Initializes `begin_` with `fmt.begin()`, `end_` with `fmt.end()`, `indexing_` with `unknown`, `next_arg_id_` with 0, and `num_args_` with `num_args`.

```
constexpr const_iterator begin() const noexcept;
```

**Returns:** `begin_`.

```
constexpr const_iterator end() const noexcept;
```

**Returns:** `end_`.

```
constexpr void advance_to(const_iterator it);
```

**Preconditions:** `end()` is reachable from `it`.

**Effects:** Equivalent to: `begin_ = it`;

```
constexpr size_t next_arg_id();
```

**Effects:** If `indexing_ != manual`, equivalent to:
- `if (indexing_ == unknown)
  indexing_ = automatic;
  return next_arg_id_++;

**Throws:** `format_error` if `indexing_ == manual` which indicates mixing of automatic and manual argument indexing.

```
constexpr void check_arg_id(size_t id);
```

**Effects:** If `indexing_ != automatic`, equivalent to:
- `if (indexing_ == unknown)
  indexing_ = manual;

**Throws:** `format_error` if `indexing_ == automatic` which indicates mixing of automatic and manual argument indexing.

**Remarks:** Call expressions where `id >= num_args_` are not core constant expressions (7.7).

20.20.5.4 Class template `basic_format_context`
Out out_;  // exposition only

public:
    using iterator = Out;
    using char_type = charT;
    template<class T> using formatter_type = formatter<T, charT>;

    basic_format_arg<basic_format_context> arg(size_t id) const;
    std::locale locale();
    iterator out();
    void advance_to(iterator it);
};

An instance of basic_format_context holds formatting state consisting of the formatting arguments and the output iterator.

out_ shall model output_iterator<const charT&>.

format_context is an alias for a specialization of basic_format_context with an output iterator that appends to string, such as back_insert_iterator<string>. Similarly, wformat_context is an alias for a specialization of basic_format_context with an output iterator that appends to wstring.

[Note: For a given type charT, implementations are encouraged to provide a single instantiation of basic_format_context for appending to basic_string<charT>, vector<charT>, or any other container with contiguous storage by wrapping those in temporary objects with a uniform interface (such as a span<charT>) and polymorphic reallocation. — end note]

basic_format_arg<basic_format_context> arg(size_t id) const;

Returns: args_.get(id).

std::locale locale();

Returns: The locale passed to the formatting function if the latter takes one, and std::locale() otherwise.

iterator out();

Returns: out_.

void advance_to(iterator it);

Effects: Equivalent to: out_ = it;

Example:
struct S { int value; };

template<> struct std::formatter<S> {
    size_t width_arg_id = 0;

    // Parses a width argument id in the format { digit }.
    constexpr auto parse(format_parse_context& ctx) {
        auto iter = ctx.begin();
        auto get_char = [&] () { return iter != ctx.end() ? *iter : 0; };
        if (get_char() != '{')
            return iter;
        return ++iter;
        ++iter;
        char c = get_char();
        if (!isdigit(c) || (++iter, get_char()) != '}
            throw format_error("invalid format");
        width_arg_id = c - '0';
        ctx.check_arg_id(width_arg_id);
        return ++iter;
    }

§ 20.20.5.4 © ISO/IEC 2020 – All rights reserved 734
auto format(S s, format_context& ctx) {
    int width = visit_format_arg((auto value) -> int {
        if constexpr (!is_integral_v<decltype(value)>)
            throw format_error("width is not integral");
        else if (value < 0 || value > numeric_limits<int>::max())
            throw format_error("invalid width");
        else
            return value;
    }, ctx.arg(width_arg_id));
    return format_to(ctx.out(), "{0:x<{1}}", s.value, width);
}

std::string s = std::format("{0:{1}}", S{42}, 10);  // value of s is "xxxxxxxx42"

20.20.6 Arguments

20.20.6.1 Class template `basic_format_arg`

namespace std {
    template<class Context>
    class basic_format_arg {
        public:
            class handle;
        private:
            using char_type = typename Context::char_type;
            variant<monostate, bool, char_type,
                int, unsigned int, long long int, unsigned long long int,
                float, double, long double,
                const char_type*, basic_string_view<char_type>,
                const void*, handle> value;

        template<class T> explicit basic_format_arg(const T& v) noexcept;  // exposition only
        explicit basic_format_arg(float n) noexcept;  // exposition only
        explicit basic_format_arg(double n) noexcept;  // exposition only
        explicit basic_format_arg(long double n) noexcept;  // exposition only
        explicit basic_format_arg(const char_type* s);  // exposition only

        template<class traits>
        explicit basic_format_arg(basic_string_view<char_type, traits> s) noexcept;  // exposition only

        template<class traits, class Allocator>
        explicit basic_format_arg(const basic_string<char_type, traits, Allocator>& s) noexcept;  // exposition only

        explicit basic_format_arg(nullptr_t) noexcept;  // exposition only
        template<class T>
        explicit basic_format_arg(const T* p) noexcept;  // exposition only

        public:
            basic_format_arg() noexcept;
            explicit operator bool() const noexcept;
    };

1 An instance of `basic_format_arg` provides access to a formatting argument for user-defined formatters.
2 The behavior of a program that adds specializations of `basic_format_arg` is undefined.
basic_format_arg() noexcept;

Postconditions: !(this).

template<class T> explicit basic_format_arg(const T& v) noexcept;

Constraints: The template specialization

typeid Context::template formatter_type<T>

meets the Formatter requirements (20.20.5.1). The extent to which an implementation determines that the specialization meets the Formatter requirements is unspecified, except that as a minimum the expression

typeid Context::template formatter_type<T>()

.format(declval<const T&>(), declval<Context&>())

shall be well-formed when treated as an unevaluated operand.

Effects:

(5.1) — if T is bool or char_type, initializes value with v;
(5.2) — otherwise, if T is char and char_type is wchar_t, initializes value with static_cast<wchar_t>(v);
(5.3) — otherwise, if T is a signed integer type (6.8.1) and sizeof(T) <= sizeof(int), initializes value with static_cast<int>(v);
(5.4) — otherwise, if T is an unsigned integer type and sizeof(T) <= sizeof(unsigned int), initializes value with static_cast<unsigned int>(v);
(5.5) — otherwise, if T is a signed integer type and sizeof(T) <= sizeof(long long int), initializes value with static_cast<long long int>(v);
(5.6) — otherwise, if T is an unsigned integer type and sizeof(T) <= sizeof(unsigned long long int), initializes value with static_cast<unsigned long long int>(v);
(5.7) — otherwise, initializes value with handle(v).

explicit basic_format_arg(float n) noexcept;
explicit basic_format_arg(double n) noexcept;
explicit basic_format_arg(long double n) noexcept;

Effects: Initializes value with n.

explicit basic_format_arg(const char_type* s);

 Preconditions: s points to a NTCTS (16.3.18).

Effects: Initializes value with s.

template<class traits>
explicit basic_format_arg(basic_string_view<char_type, traits> s) noexcept;

Effects: Initializes value with s.

template<class traits, class Allocator>
explicit basic_format_arg(const basic_string<char_type, traits, Allocator>& s) noexcept;

Effects: Initializes value with basic_string_view<char_type>(s.data(), s.size()).

explicit basic_format_arg(nullptr_t) noexcept;

Effects: Initializes value with static_cast<const void*>(nullptr).

template<class T> explicit basic_format_arg(const T* p) noexcept;

Constraints: is_void_v<T> is true.

Effects: Initializes value with p.

[Note: Constructing basic_format_arg from a pointer to a member is ill-formed unless the user provides an enabled specialization of formatter for that pointer to member type. — end note]
explicit operator bool() const noexcept;

Returns: !holds_alternative<monostate>(value).

The class handle allows formatting an object of a user-defined type.

namespace std {
    template<class Context>
    class basic_format_arg<Context>::handle {
        const void* ptr_;  // exposition only
        void (*format_)(basic_format_parse_context<char_type>&, Context&, const void*);  // exposition only

        template<class T> explicit handle(const T& val) noexcept;  // exposition only

        friend class basic_format_arg<Context>;  // exposition only

        public:
            void format(basic_format_parse_context<char_type>&, Context& ctx) const;
    };
}

template<class T> explicit handle(const T& val) noexcept;

Effects: Initializes ptr_ with addressof(val) and format_ with

[](basic_format_parse_context<char_type>& parse_ctx, Context& format_ctx, const void* ptr) {
    typename Context::template formatter_type<T> f;
    parse_ctx.advance_to(f.parse(parse_ctx));
    format_ctx.advance_to(f.format(*static_cast<const T*>(ptr), format_ctx));
}

Effects: Equivalent to: format_(parse_ctx, format_ctx, ptr_);

template<class Visitor, class Context>
see below visit_format_arg(Visitor& vis, basic_format_arg<Context> arg);

Effects: Equivalent to: return visit(forward<Visitor>(vis), arg.value);

20.20.6.2 Class template format-arg-store

namespace std {
    template<class Context, class... Args>
    struct format-arg-store {
        // exposition only
        array<basic_format_arg<Context>, sizeof...(Args)> args;
    };
}

An instance of format-arg-store stores formatting arguments.

template<class Context = format_context, class... Args>
    format-arg-store<Context, Args...> make_format_args(const Args&... args);

Preconditions: The type typename Context::template formatter_type<T> meets the Formatter
requirements (20.20.5.1) for each T in Args.

Returns: {basic_format_arg<Context>(args)...}.

template<class... Args>
    format-arg-store<wformat_context, Args...> make_wformat_args(const Args&... args);

Effects: Equivalent to: return make_format_args<wformat_context>(args...);

20.20.6.3 Class template basic_format_args

namespace std {
    template<class Context>
    class basic_format_args {
        size_t size_;  // exposition only
    };
}
const basic_format_arg<Context>* data_;  // exposition only

public:

basic_format_args() noexcept;

template<class... Args>

basic_format_args(const format_arg_store<Context, Args...>& store) noexcept;

basic_format_arg<Context> get(size_t i) const noexcept;

};

An instance of basic_format_args provides access to formatting arguments.

basic_format_args() noexcept;

Effects: Initializes size_ with 0.

template<class... Args>

basic_format_args(const format_arg_store<Context, Args...>& store) noexcept;

Effects: Initializes size_ with sizeof...(Args) and data_ with store.args.data().

basic_format_arg<Context> get(size_t i) const noexcept;

Returns: i < size_ ? data_[i] : basic_format_arg<Context>().

[Note: Implementations are encouraged to optimize the representation of basic_format_args for small number of formatting arguments by storing indices of type alternatives separately from values and packing the former. — end note]

20.20.7 Class format_error

namespace std {

class format_error : public runtime_error {

public:

    explicit format_error(const string& what_arg);

    explicit format_error(const char* what_arg);

};

}

The class format_error defines the type of objects thrown as exceptions to report errors from the formatting library.

format_error(const string& what_arg);

Postconditions: strcmp(what(), what_arg.c_str()) == 0.

format_error(const char* what_arg);

Postconditions: strcmp(what(), what_arg) == 0.
21 Strings library

21.1 General

This Clause describes components for manipulating sequences of any non-array trivial standard-layout (6.8) type. Such types are called char-like types, and objects of char-like types are called char-like objects or simply characters.

The following subclauses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in Table 68.

Table 68: Strings library summary

</tr>
</tbody>
</table>

21.2 Character traits

This subclause defines requirements on classes representing character traits, and defines a class template char_traits<charT>, along with five specializations, char_traits<char>, char_traits<char8_t>, char_traits<char16_t>, char_traits<char32_t>, and char_traits<wchar_t>, that meet those requirements.

Most classes specified in 21.3, 21.4, and Clause 29 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member typedef-names and functions in the template parameter traits used by each such template. This subclause defines the semantics of these members.

To specialize those templates to generate a string, string view, or iostream class to handle a particular character container type (16.3.3) C, that and its related character traits class X are passed as a pair of parameters to the string, string view, or iostream template as parameters charT and traits. If X::char_type is not the same type as C, the program is ill-formed.

21.2.1 Character traits requirements

In Table 69, X denotes a traits class defining types and functions for the character container type C; c and d denote values of type C; p and q denote values of type const C*; s denotes a value of type C*; n, i and j denote values of type size_t; e and f denote values of type X::int_type; pos denotes a value of type X::pos_type; and r denotes an lvalue of type C. Operations on X shall not throw exceptions.

</table>

The class template

```cpp
template<class charT> struct char_traits;
```

is provided in the header `<string>` as a basis for explicit specializations.

### 21.2.2 Traits typedefs

[char.traits.typedefs]

```cpp
using int_type = see below;
```

1. **Preconditions:** `int_type` shall be able to represent all of the valid characters converted from the corresponding `char_type` values, as well as an end-of-file value, `eof()`.

```cpp
using state_type = see below;
```

2. **Preconditions:** `state_type` meets the `Cpp17Destructible` (Table 32), `Cpp17CopyAssignable` (Table 31), `Cpp17CopyConstructible` (Table 29), and `Cpp17DefaultConstructible` (Table 27) requirements.

### 21.2.3 char_traits specializations

[char.traits.specializations]

```cpp
namespace std {
    template<> struct char_traits<char> {
        using char_type = char;
        using int_type = int;
        using off_type = streamoff;
        using pos_type = streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;
        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                                const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    }
}
```

1. The header `<string>` defines five specializations of the class template `char_traits`: `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`.

#### 21.2.3.1 struct char_traits<char>

[char.traits.specializations.char]

```cpp
namespace std {
    template<> struct char_traits<char> {
        using char_type = char;
        using int_type = int;
        using off_type = streamoff;
        using pos_type = streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;
        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                                const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    }
}
```

221) If `eof()` can be held in `char_type` then some iostreams operations can give surprising results.

§ 21.2.3.1 ©ISO/IEC 2020 – All rights reserved 741
static constexpr int_type not_eof(int_type c) noexcept;
static constexpr char_type to_char_type(int_type c) noexcept;
static constexpr int_type to_int_type(char_type c) noexcept;
static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
static constexpr int_type eof() noexcept;
};

1 The type mbstate_t is defined in <cwchar> and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.

2 The two-argument member assign is defined identically to the built-in operator =. The two-argument members eq and lt are defined identically to the built-in operators == and < for type unsigned char.

3 The member eof() returns EOF.

21.2.3.2 struct char_traits<char8_t> [char.traits.specializations.char8.t]

namespace std {
    template<> struct char_traits<char8_t> {
        using char_type = char8_t;
        using int_type = unsigned int;
        using off_type = streamoff;
        using pos_type = u8streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}

1 The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and < respectively.

2 The member eof() returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

21.2.3.3 struct char_traits<char16_t> [char.traits.specializations.char16.t]

namespace std {
    template<> struct char_traits<char16_t> {
        using char_type = char16_t;
        using int_type = uint_least16_t;
        using off_type = streamoff;
        using pos_type = u16streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}
21.2.3.4 struct char_traits<char32_t> [char.traits.specializations.char32.t]

namespace std {
    template<> struct char_traits<char32_t> {
        using char_type = char32_t;
        using int_type = uint_least32_t;
        using off_type = streamoff;
        using pos_type = u32streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                                  const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);

        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    }
};

1 The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and <, respectively.

2 The member eof() returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

21.2.3.5 struct char_traits<wchar_t> [char.traits.specializations.wchar.t]

namespace std {
    template<> struct char_traits<wchar_t> {
        using char_type = wchar_t;
        using int_type = wint_t;
        using off_type = streamoff;
        using pos_type = wstreampos;
        using state_type = mbstate_t;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                                  const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);

        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    }
};

1 The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and <, respectively.

2 The member eof() returns an implementation-defined constant that cannot appear as a Unicode code point.
using comparison_category = strong_ordering;

static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
static constexpr bool eq(char_type c1, char_type c2) noexcept;
static constexpr bool lt(char_type c1, char_type c2) noexcept;
static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
static constexpr size_t length(const char_type* s);
static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
static constexpr char_type* assign(char_type* s, size_t n, char_type a);
static constexpr int_type not_eof(int_type c) noexcept;
static constexpr char_type to_char_type(int_type c) noexcept;
static constexpr int_type to_int_type(char_type c) noexcept;
static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
static constexpr int_type eof() noexcept;
};

The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and <, respectively.

The member eof() returns WEOF.

21.3 String classes

The header <string> defines the basic_string class template for manipulating varying-length sequences of char-like objects and five typedef-names, string, u8string, u16string, u32string, and wstring, that name the specializations basic_string<char>, basic_string<char8_t>, basic_string<char16_t>, basic_string<char32_t>, and basic_string<wchar_t>, respectively.

21.3.1 Header <string> synopsis

#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.1

namespace std {
    // 21.2, character traits

21.3.2 Class template basic_string

The class template basic_string describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a “string” if the type of the char-like objects that it holds is clear from context. In the rest of this Clause, the type of the char-like objects held in a basic_string object is designated by charT.

A specialization of basic_string is a contiguous container (22.2.1). In all cases, [data(), data() + size()] is a valid range, data() + size() points at an object with value charT() (a “null terminator”), and size() <= capacity() is true.

    -> basic_string<typename iterator_traits<InputIterator>::value_type,  
        char_traits<typename iterator_traits<InputIterator>::value_type>,  
        Allocator>;

template<class charT, 
    class traits, 
    class Allocator = allocator<charT>>  
explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())  
    -> basic_string<charT, traits, Allocator>;

template<class charT,  
    class traits,  
    class Allocator = allocator<charT>>  
basic_string(basic_string_view<charT, traits>,  
    typename see below::size_type, typename see below::size_type,  
    const Allocator& = Allocator())  
    -> basic_string<charT, traits, Allocator>;

A size_type parameter type in a basic_string deduction guide refers to the size_type member type of the type deduced by the deduction guide.

21.3.2.1 General requirements  [string.require]

1 If any operation would cause size() to exceed max_size(), that operation throws an exception object of type length_error.

2 If any member function or operator of basic_string throws an exception, that function or operator has no other effect on the basic_string object.

3 In every specialization basic_string<charT, traits, Allocator>, the type allocator_traits<Allocator>::value_type shall name the same type as charT. Every object of type basic_string<charT, traits, Allocator> uses an object of type Allocator to allocate and free storage for the contained charT objects as needed. The Allocator object used is obtained as described in 22.2.1. In every specialization basic_string<charT, traits, Allocator>, the type traits shall meet the character traits requirements (21.2). [Note: The program is ill-formed if traits::char_type is not the same type as charT. — end note]

4 References, pointers, and iterators referring to the elements of a basic_string sequence may be invalidated by the following uses of that basic_string object:

   — Passing as an argument to any standard library function taking a reference to non-const basic_string as an argument.222

   — Calling non-const member functions, except operator[], at, data, front, back, begin, rbegin, end, and rend.

21.3.2.2 Constructors and assignment operators  [string.cons]

constexpr explicit basic_string(const Allocator& a) noexcept;

Postconditions: size() is equal to 0.

constexpr basic_string(const basic_string& str);
constexpr basic_string(basic_string&& str) noexcept;

Effects: Constructs an object whose value is that of str prior to this call.

Remarks: In the second form, str is left in a valid but unspecified state.

222) For example, as an argument to non-member functions swap() (21.3.3.3), operator>>() (21.3.3.4), and getline() (21.3.3.4), or as an argument to basic_string::swap().
constexpr basic_string(const basic_string& str, size_type pos, const Allocator& a = Allocator());
constexpr basic_string(const basic_string& str, size_type pos, size_type n, const Allocator& a = Allocator());

Effects: Let \( n \) be \( \text{npos} \) for the first overload. Equivalent to:
\[
\text{basic_string}((\text{basic_string_view}\langle\text{charT}, \text{traits}\rangle(str).substr(pos), n), a)
\]

template<class T>
constexpr basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());

Constraints: \( \text{is\_convertible\_v<\text{const T}&, \text{basic\_string\_view}\langle\text{charT}, \text{traits}\rangle>} \) is true.

Effects: Creates a variable, \( sv \), as if by \( \text{basic\_string\_view}\langle\text{charT}, \text{traits}\rangle sv = t \); and then behaves the same as:
\[
\text{basic\_string}(sv.substr(pos), n), a);
\]

template<class T>
constexpr explicit basic_string(const T& t, const Allocator& a = Allocator());

Constraints:

(7.1) \( \text{is\_convertible\_v<\text{const T}&, \text{basic\_string\_view}\langle\text{charT}, \text{traits}\rangle>} \) is true and

(7.2) \( \text{is\_convertible\_v<\text{const T}&, \text{const charT}>} \) is false.

Effects: Creates a variable, \( sv \), as if by \( \text{basic\_string\_view}\langle\text{charT}, \text{traits}\rangle sv = t \); and then behaves the same as \( \text{basic\_string}(sv\text{.data()}, sv\text{.size}(), a) \).

constexpr basic_string(const charT* s, size_type n, const Allocator& a = Allocator());

Preconditions: \( [s, s + n) \) is a valid range.

Effects: Constructs an object whose initial value is the range \( [s, s + n) \).

Postconditions: \( \text{size()} \) is equal to \( n \), and \( \text{traits::compare(data(), s, n)} \) is equal to \( 0 \).

constexpr basic_string(const charT* s, const Allocator& a = Allocator());

Constraints: \( \text{Allocator} \) is a type that qualifies as an allocator (22.2.1). [Note: This affects class template argument deduction. — end note]

Effects: Equivalent to \( \text{basic\_string}(s, \text{traits::length}(s), a) \).

constexpr basic_string(size_type n, charT c, const Allocator& a = Allocator());

Constraints: \( \text{Allocator} \) is a type that qualifies as an allocator (22.2.1). [Note: This affects class template argument deduction. — end note]

Effects: Constructs an object whose value consists of \( n \) copies of \( c \).

template<class InputIterator>
constexpr basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());

Constraints: \( \text{InputIterator} \) is a type that qualifies as an input iterator (22.2.1).

Effects: Constructs a string from the values in the range \( [\text{begin}, \text{end}) \), as indicated in Table 77.

constexpr basic_string(initializer_list<charT> il, const Allocator& a = Allocator());

Effects: Equivalent to \( \text{basic\_string}(il\text{.begin()}, il\text{.end}(), a) \).

constexpr basic_string(const basic_string& str, const Allocator& alloc); constexpr basic_string(basic_string&& str, const Allocator& alloc);

Effects: Constructs an object whose value is that of \( \text{str} \) prior to this call. The stored allocator is constructed from \( \text{alloc} \). In the second form, \( \text{str} \) is left in a valid but unspecified state.

Throws: The second form throws nothing if \( \text{alloc} \) == \( \text{str}\text{.get\_allocator()} \).

template<class InputIterator, class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
basic_string(InputIterator, InputIterator, Allocator = Allocator())
-> basic_string<typename iterator_traits<InputIterator>::value_type>,
char_traits<typename iterator_traits<InputIterator>::value_type>,
Allocator>;  

Constraints: InputIterator is a type that qualifies as an input iterator, and Allocator is a type that qualifies as an allocator (22.2.1).

template<class charT,
    class traits,
    class Allocator = allocator<charT>>
explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
  -> basic_string<charT, traits, Allocator>;

template<class charT,
    class traits,
    class Allocator = allocator<charT>>
basic_string(basic_string_view<charT, traits>,
    typename see below::size_type, typename see below::size_type,
    const Allocator& = Allocator())
  -> basic_string<charT, traits, Allocator>;

Constraints: Allocator is a type that qualifies as an allocator (22.2.1).

constexpr basic_string& operator=(const basic_string& str);

Effects: If *this and str are the same object, has no effect. Otherwise, replaces the value of *this with a copy of str.

Returns: *this.

constexpr basic_string& operator=(basic_string&& str)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
            allocator_traits<Allocator>::is_always_equal::value);

Effects: Move assigns as a sequence container (22.2), except that iterators, pointers and references may be invalidated.

Returns: *this.

template<class T>
constexpr basic_string& operator=(const T& t);

Constraints:
(27.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(27.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return assign(sv);

constexpr basic_string& operator=(const charT* s);

Effects: Equivalent to: return *this = basic_string_view<charT, traits>(s);

constexpr basic_string& operator=(charT c);

Effects: Equivalent to:
    return *this = basic_string_view<charT, traits>(addressof(c), 1);

constexpr basic_string& operator=(initializer_list<charT> il);

Effects: Equivalent to:
    return *this = basic_string_view<charT, traits>(il.begin(), il.size());

21.3.2.3 Iterator support
[string.iterators]

constexpr iterator begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;

Returns: An iterator referring to the first character in the string.
constexpr iterator end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;

Returns: An iterator which is the past-the-end value.

constexpr reverse_iterator rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;

Returns: An iterator which is semantically equivalent to reverse_iterator(end()).

constexpr reverse_iterator rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

Returns: An iterator which is semantically equivalent to reverse_iterator(begin()).

2.1.3.2.4 Capacity [string.capacity]

constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;

Returns: A count of the number of char-like objects currently in the string.
Complexity: Constant time.

constexpr size_type max_size() const noexcept;

Returns: The largest possible number of char-like objects that can be stored in a basic_string.
Complexity: Constant time.

constexpr void resize(size_type n, charT c);

Effects: Alters the value of *this as follows:

— If n <= size(), erases the last size() - n elements.
— If n > size(), appends n - size() copies of c.

constexpr void resize(size_type n);

Effects: Equivalent to resize(n, charT()).

constexpr size_type capacity() const noexcept;

Returns: The size of the allocated storage in the string.
Complexity: Constant time.

constexpr void reserve(size_type res_arg);

Effects: A directive that informs a basic_string of a planned change in size, so that the storage allocation can be managed accordingly. After reserve(), capacity() is greater or equal to the argument of reserve if reallocation happens; and equal to the previous value of capacity() otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of reserve().

Throws: length_error if res_arg > max_size() or any exceptions thrown by allocator_traits<Allocator>::allocate.

constexpr void shrink_to_fit();

Effects: shrink_to_fit is a non-binding request to reduce capacity() to size(). [Note: The request is non-binding to allow latitude for implementation-specific optimizations. — end note] It does not increase capacity(), but may reduce capacity() by causing reallocation.

Complexity: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator. [Note: If no reallocation happens, they remain valid. — end note]
constexpr void clear() noexcept;

Effects: Equivalent to: erase(begin(), end());

[[nodiscard]] constexpr bool empty() const noexcept;

Effects: Equivalent to: return size() == 0;

## 21.3.2.5 Element access

```cpp
constexpr const_reference operator[](size_type pos) const;
constexpr reference operator[](size_type pos);
```

1. Preconditions: \( \text{pos} \leq \text{size}() \).
2. Returns: \(*\text{begin()} + \text{pos}\) if \( \text{pos} < \text{size}() \). Otherwise, returns a reference to an object of type charT with value charT(), where modifying the object to any value other than charT() leads to undefined behavior.

```cpp
constexpr const_reference at(size_type pos) const;
constexpr reference at(size_type pos);
```

5. Throws: out_of_range if \( \text{pos} \geq \text{size}() \).
6. Returns: \(\text{operator[]}(\text{pos})\).

```cpp
constexpr const charT& front() const;
constexpr charT& front();
```

7. Preconditions: !empty().
8. Effects: Equivalent to: return \(\text{operator[]}(0)\);

```cpp
constexpr const charT& back() const;
constexpr charT& back();
```

9. Preconditions: !empty().
10. Effects: Equivalent to: return \(\text{operator[]}(\text{size}() - 1)\);

## 21.3.2.6 Modifiers

### 21.3.2.6.1 basic_string::operator+=

```cpp
constexpr basic_string& operator+=(const basic_string& str);
```

1. Effects: Equivalent to: return append(str);

```cpp
template<class T>
constexpr basic_string& operator+=(const T& t);
```

2. Constraints:
   1. is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
   2. is_convertible_v<const T&, const charT* > is false.
3. Effects: Equivalent to:
   ```cpp
   basic_string_view<charT, traits> sv = t;
   return append(sv);
   ```

```cpp
constexpr basic_string& operator+=(const charT* s);
```

4. Effects: Equivalent to: return append(s);

```cpp
constexpr basic_string& operator+=(charT c);
```

5. Effects: Equivalent to: return append(size_type{1}, c);

```cpp
constexpr basic_string& operator+=(initializer_list<charT> il);
```

6. Effects: Equivalent to: return append(il);

§ 21.3.2.6.1 ©ISO/IEC 2020 – All rights reserved 756
21.3.2.6.2 basic_string::append

```cpp
constexpr basic_string& append(const basic_string& str);
```

**Effects:** Equivalent to: `return append(str.data(), str.size());`

```cpp
constexpr basic_string& append(const basic_string& str, size_type pos, size_type n = npos);
```

**Effects:** Equivalent to:
```cpp
return append(basic_string_view<charT, traits>(str).substr(pos, n));
```

```cpp
template<class T>
constexpr basic_string& append(const T& t);
```

**Constraints:**
- (3.1) `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
- (3.2) `is_convertible_v<const T&, const charT*>` is false.

**Effects:** Equivalent to:
```cpp
basic_string_view<charT, traits> sv = t;
return append(sv.data(), sv.size());
```

```cpp
template<class T>
constexpr basic_string& append(const T& t, size_type pos, size_type n = npos);
```

**Constraints:**
- (5.1) `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
- (5.2) `is_convertible_v<const T&, const charT*>` is false.

**Effects:** Equivalent to:
```cpp
basic_string_view<charT, traits> sv = t;
return append(sv.substr(pos, n));
```

```cpp
constexpr basic_string& append(const charT* s, size_type n);
```

**Preconditions:** `[s, s + n)` is a valid range.

**Effects:** Appends a copy of the range `[s, s + n)` to the string.

**Returns:** `*this`.

```cpp
constexpr basic_string& append(const charT* s);
```

**Effects:** Equivalent to: `return append(s, traits::length(s));`

```cpp
constexpr basic_string& append(size_type n, charT c);
```

**Effects:** Appends n copies of `c` to the string.

**Returns:** `*this`.

```cpp
template<class InputIterator>
constexpr basic_string& append(InputIterator first, InputIterator last);
```

**Constraints:** `InputIterator` is a type that qualifies as an input iterator (22.2.1).

**Effects:** Equivalent to: `return append(basic_string(first, last, get_allocator()));`

```cpp
constexpr basic_string& append(initializer_list<charT> il);
```

**Effects:** Equivalent to: `return append(il.begin(), il.size());`

```cpp
constexpr void push_back(charT c);
```

**Effects:** Equivalent to `append(size_type{1}, c)`.

21.3.2.6.3 basic_string::assign

```cpp
constexpr basic_string& assign(const basic_string& str);
```

**Effects:** Equivalent to: `return *this = str;`
constexpr basic_string& assign(basic_string&& str)
noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
allocator_traits<Allocator>::is_always_equal::value);

Effects: Equivalent to: return *this = std::move(str);

constexpr basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);

Effects: Equivalent to:
return assign(basic_string_view<charT, traits>(str).substr(pos, n));

Effects: Equivalent to:
return *this = std::move(str);

Effects: Equivalent to:
return assign(basic_string_view<charT, traits>(str).substr(pos, n));

template<class T>
constexpr basic_string& assign(const T& t);

Constraints:
(4.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(4.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
basic_string_view<charT, traits> sv = t;
return assign(sv.data(), sv.size());

template<class T>
constexpr basic_string& assign(const T& t, size_type pos, size_type n = npos);

Constraints:
(6.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(6.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
basic_string_view<charT, traits> sv = t;
return assign(sv.substr(pos, n));

Effects: Equivalent to:
return assign(sv.data(), sv.size());

constexpr basic_string& assign(const charT* s, size_type n);

Preconditions: [s, s + n) is a valid range.

Effects: Replaces the string controlled by *this with a copy of the range [s, s + n].

Returns: *this.

constexpr basic_string& assign(const charT* s);

Effects: Equivalent to: return assign(s, traits::length(s));

constexpr basic_string& assign(initializer_list<charT> il);

Effects: Equivalent to: return assign(il.begin(), il.size());

constexpr basic_string& assign(size_type n, charT c);

Effects: Equivalent to:
clear();
resize(n, c);
return *this;

template<class InputIterator>
constexpr basic_string& assign(InputIterator first, InputIterator last);

Constraints: InputIterator is a type that qualifies as an input iterator (22.2.1).

Effects: Equivalent to: return assign(basic_string(first, last, get_allocator()));

21.3.2.6.4 basic_string::insert

[string.insert]

constexpr basic_string& insert(size_type pos, const basic_string& str);

Effects: Equivalent to: return insert(pos, str.data(), str.size());
constexpr basic_string& insert(size_type pos1, const basic_string& str, size_type pos2, size_type n = npos);

Effects: Equivalent to:

    return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);

template<class T>
constexpr basic_string& insert(size_type pos, const T& t);

Constraints:
(3.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(3.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:

    basic_string_view<charT, traits> sv = t;
    return insert(pos, sv.data(), sv.size());

template<class T>
constexpr basic_string& insert(size_type pos1, const T& t, size_type pos2, size_type n = npos);

Constraints:
(5.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(5.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:

    basic_string_view<charT, traits> sv = t;
    return insert(pos1, sv.substr(pos2, n));

constexpr basic_string& insert(size_type pos, const charT* s, size_type n);

Preconditions: [s, s + n) is a valid range.

Throws:
(8.1) out_of_range if pos > size(),
(8.2) length_error if n > max_size() - size(), or
(8.3) any exceptions thrown by allocator_traits<Allocator>::allocate.

Effects: Inserts a copy of the range [s, s + n) immediately before the character at position pos if pos < size(), or otherwise at the end of the string.

Returns: *this.

constexpr basic_string& insert(size_type pos, const charT* s);

Effects: Equivalent to: return insert(pos, s, traits::length(s));

constexpr basic_string& insert(size_type pos, size_type n, charT c);

Effects: Inserts n copies of c before the character at position pos if pos < size(), or otherwise at the end of the string.

Returns: *this

Throws:
(14.1) out_of_range if pos > size(),
(14.2) length_error if n > max_size() - size(), or
(14.3) any exceptions thrown by allocator_traits<Allocator>::allocate.

constexpr iterator insert(const_iterator p, charT c);

Preconditions: p is a valid iterator on *this.

Effects: Inserts a copy of c at the position p.

Returns: An iterator which refers to the inserted character.
constexpr iterator insert(const_iterator p, size_type n, charT c);

**Preconditions:** p is a valid iterator on *this.

**Effects:** Inserts n copies of c at the position p.

**Returns:** An iterator which refers to the first inserted character, or p if n == 0.

template<class InputIterator>
constexpr iterator insert(const_iterator p, InputIterator first, InputIterator last);

**Constraints:** InputIterator is a type that qualifies as an input iterator (22.2.1).

**Preconditions:** p is a valid iterator on *this.

**Effects:** Equivalent to insert(p - begin(), basic_string(first, last, get_allocator())).

**Returns:** An iterator which refers to the first inserted character, or p if first == last.

customexpr iterator insert(const_iterator p, initializer_list<charT> il);

**Effects:** Equivalent to: return insert(p, il.begin(), il.end());

21.3.2.6.5 basic_string::erase

constexpr basic_string& erase(size_type pos = 0, size_type n = npos);

**Throws:** out_of_range if pos > size().

**Effects:** Determines the effective length xlen of the string to be removed as the smaller of n and size() - pos. Removes the characters in the range [begin() + pos, begin() + pos + xlen).

**Returns:** *this.

customexpr iterator erase(const_iterator p);

**Preconditions:** p is a valid dereferenceable iterator on *this.

**Throws:** Nothing.

**Effects:** Removes the character referred to by p.

**Returns:** An iterator which points to the element immediately following p prior to the element being erased. If no such element exists, end() is returned.

customexpr iterator erase(const_iterator first, const_iterator last);

**Preconditions:** first and last are valid iterators on *this. [first, last) is a valid range.

**Throws:** Nothing.

**Effects:** Removes the characters in the range [first, last).

**Returns:** An iterator which points to the element pointed to by last prior to the other elements being erased. If no such element exists, end() is returned.

customexpr void pop_back();

**Preconditions:** !empty().

**Throws:** Nothing.

**Effects:** Equivalent to erase(end() - 1).

21.3.2.6.6 basic_string::replace

constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str);

**Effects:** Equivalent to: return replace(pos1, n1, str.data(), str.size());

constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str,
    size_type pos2, size_type n2 = npos);

**Effects:** Equivalent to:
    return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));
template<class T>
    constexpr basic_string& replace(size_type pos1, size_type n1, const T& t);

    Constraints:
1. is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
2. is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return replace(pos1, n1, sv.data(), sv.size());

template<class T>
    constexpr basic_string& replace(size_type pos1, size_type n1, const T& t,
        size_type pos2, size_type n2 = npos);

    Constraints:
1. is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
2. is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return replace(pos1, n1, sv.substr(pos2, n2));

constexpr basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);

    Preconditions: [s, s + n2) is a valid range.

    Throws:
1. out_of_range if pos1 > size(),
2. length_error if the length of the resulting string would exceed max_size() (see below), or
3. any exceptions thrown by allocator_traits<Allocator>::allocate.

Effects: Determines the effective length xlen of the string to be removed as the smaller of n1 and size() - pos1. If size() - xlen >= max_size() - n2 throws length_error. Otherwise, the function replaces the characters in the range [begin() + pos1, begin() + pos1 + xlen) with a copy of the range [s, s + n2).

Returns: *this.

constexpr basic_string& replace(size_type pos, size_type n, const charT* s);

    Effects: Equivalent to: return replace(pos, n, s, traits::length(s));

constexpr basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);

    Throws:
1. out_of_range if pos1 > size(),
2. length_error if the length of the resulting string would exceed max_size() (see below), or
3. any exceptions thrown by allocator_traits<Allocator>::allocate.

Effects: Determines the effective length xlen of the string to be removed as the smaller of n1 and size() - pos1. If size() - xlen >= max_size() - n2 throws length_error. Otherwise, the function replaces the characters in the range [begin() + pos1, begin() + pos1 + xlen) with n2 copies of c.

Returns: *this.

constexpr basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);

    Effects: Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(str));

template<class T>
    constexpr basic_string& replace(const_iterator i1, const_iterator i2, const T& t);

    Constraints:
1. is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
— is_convertible_v<const Tk, const charT*> is false.

17. Preconditions: [begin(), i1) and (i1, i2) are valid ranges.

18. Effects: Equivalent to:

   constexpr basic_string_view<charT, traits> sv = t;
   return replace(i1 - begin(), i2 - begin(), sv.data(), sv.size());

   constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);

   Effects: Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(s, n));

   constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);

   Effects: Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(s));

   constexpr basic_string& replace(const_iterator i1, const_iterator i2, size_type n, charT c);

   Preconditions: [begin(), i1) and (i1, i2) are valid ranges.

   Effects: Equivalent to: return replace(i1 - begin(), i2 - begin(), n, c);

20. Constraints: InputIterator is a type that qualifies as an input iterator (22.2.1).

   Effects: Equivalent to: return replace(i1, i2, basic_string(j1, j2, get_allocator()));

   constexpr basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);

   Effects: Equivalent to: return replace(i1, i2, il.begin(), il.size());

21.3.2.6.7 basic_string::copy

   constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;  

   Effects: Equivalent to: return basic_string_view<charT, traits>(*this).copy(s, n, pos);

   [Note: This does not terminate s with a null object. — end note]

21.3.2.6.8 basic_string::swap

   constexpr void swap(basic_string& s) noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||   allocator_traits<Allocator>::is_always_equal::value);

   Preconditions: allocator_traits<Allocator>::propagate_on_container_swap::value is true or   get_allocator() == s.get_allocator().

   Postconditions: *this contains the same sequence of characters that was in s, s contains the same   sequence of characters that was in *this.

   Throws: Nothing.

   Complexity: Constant time.

21.3.2.7 String operations

21.3.2.7.1 Accessors

   constexpr const charT* c_str() const noexcept;

   constexpr const charT* data() const noexcept;

   Returns: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()).

   Complexity: Constant time.

   Remarks: The program shall not modify any of the values stored in the character array; otherwise, the   behavior is undefined.

   constexpr charT* data() noexcept;

   Returns: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()).

   Complexity: Constant time.
Remarks: The program shall not modify the value stored at \( p + \text{size()} \) to any value other than \( \text{charT]() \); otherwise, the behavior is undefined.

```cpp
constexpr operator basic_string_view<charT, traits>() const noexcept;
```

Effects: Equivalent to: return basic_string_view<charT, traits>(data(), size());

```cpp
constexpr allocator_type get_allocator() const noexcept;
```

Returns: A copy of the Allocator object used to construct the string or, if that allocator has been replaced, a copy of the most recent replacement.

### 21.3.2.7.2 Searching

Let \( F \) be one of find, rfind, find_first_of, find_last_of, find_first_not_of, and find_last_not_of.

1. Each member function of the form
   ```cpp
   constexpr size_type F(const basic_string& str, size_type pos) const noexcept;
   ```
   has effects equivalent to: return \( F(\text{basic_string_view<charT, traits>(str)}, \text{pos}) \);

2. Each member function of the form
   ```cpp
   constexpr size_type F(const charT* s, size_type pos) const;
   ```
   has effects equivalent to: return \( F(\text{basic_string_view<charT, traits>(s)}, \text{pos}) \);

3. Each member function of the form
   ```cpp
   constexpr size_type F(const charT* s, size_type pos, size_type n) const;
   ```
   has effects equivalent to: return \( F(\text{basic_string_view<charT, traits>(s, n)}, \text{pos}) \);

4. Each member function of the form
   ```cpp
   constexpr size_type F(charT c, size_type pos) const noexcept;
   ```
   has effects equivalent to:
   ```cpp
   return F(\text{basic_string_view<charT, traits>(\text{addressof(c)}, 1)}, \text{pos}) ;
   ```

#### Constraints:

1. is_convertible_v<const T&, basic_string_view<charT, traits>> is true and

2. is_convertible_v<const T&, const charT*> is false.

Effects: Let \( G \) be the name of the function. Equivalent to:
```cpp
basic_string_view<charT, traits> s = *this, sv = t;
return s.G(sv, pos);
```

Remarks: The expression inside noexcept is equivalent to is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>.

### 21.3.2.7.3 basic_string::substr

```cpp
constexpr basic_string substr(size_type pos = 0, size_type n = npos) const;
```

1. Throws: out_of_range if \( \text{pos} > \text{size()} \).

2. Effects: Determines the effective length \( rlen \) of the string to copy as the smaller of \( n \) and \( \text{size()} - \text{pos} \).
Returns: basic_string(data()+pos, rlen).

21.3.2.7.4 basic_string::compare [string.compare]

```cpp
template<class T>
constexpr int compare(const T& t) const noexcept(see below);
```

1 Constraints:
   (1.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
   (1.2) is_convertible_v<const T&, const charT*> is false.

2 Effects: Equivalent to: return basic_string_view<charT, traits>(*this).compare(t);

3 Remarks: The expression inside noexcept is equivalent to is_nothrow_convertible_v<const T&,
   basic_string_view<charT, traits>>.

```cpp
template<class T>
constexpr int compare(size_type pos1, size_type n1, const T& t) const;
```

4 Constraints:
   (4.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
   (4.2) is_convertible_v<const T&, const charT*> is false.

5 Effects: Equivalent to:
   return basic_string_view<charT, traits>(*this).substr(pos1, n1).compare(t);

```cpp
template<class T>
constexpr int compare(size_type pos1, size_type n1, const T& t, size_type pos2, size_type n2 = npos) const;
```

6 Constraints:
   (6.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
   (6.2) is_convertible_v<const T&, const charT*> is false.

7 Effects: Equivalent to:
   basic_string_view<charT, traits> s = *this, sv = t;
   return s.substr(pos1, n1).compare(sv.substr(pos2, n2));

```cpp
constexpr int compare(const basic_string& str) const noexcept;
```

8 Effects: Equivalent to:
   return compare(basic_string_view<charT, traits>(str));

```cpp
constexpr int compare(size_type pos1, size_type n1, const basic_string& str) const;
```

9 Effects: Equivalent to:
   return compare(pos1, n1, basic_string_view<charT, traits>(str));

```cpp
constexpr int compare(size_type pos1, size_type n1, const basic_string& str, size_type pos2, size_type n2 = npos) const;
```

10 Effects: Equivalent to:
   return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);

```cpp
constexpr int compare(const charT* s) const;
```

11 Effects: Equivalent to:
   return compare(basic_string_view<charT, traits>(s));

```cpp
constexpr int compare(size_type pos, size_type n1, const charT* s) const;
```

12 Effects: Equivalent to:
   return compare(pos, n1, basic_string_view<charT, traits>(s));

```cpp
constexpr int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;
```

13 Effects: Equivalent to:
   return compare(pos, n1, basic_string_view<charT, traits>(s, n2));

21.3.2.7.5 basic_string::starts_with [string.starts.with]

```cpp
constexpr bool starts_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool starts_with(charT x) const noexcept;
```
constexpr bool starts_with(const charT* x) const;

Effects: Equivalent to:

return basic_string_view<charT, traits>(data(), size()).starts_with(x);

21.3.2.7.6 basic_string::ends_with

constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool ends_with(charT x) const noexcept;
constexpr bool ends_with(const charT* x) const;

Effects: Equivalent to:

return basic_string_view<charT, traits>(data(), size()).ends_with(x);

21.3.3 Non-member functions

21.3.3.1 operator+

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
const basic_string<charT, traits, Allocator>& rhs);

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

Effects: Equivalent to:

basic_string<charT, traits, Allocator> r = lhs;
r.append(rhs);
return r;

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,
const basic_string<charT, traits, Allocator>& rhs);

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, const charT* rhs);

Effects: Equivalent to:

lhs.append(rhs);
return std::move(lhs);

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
basic_string<charT, traits, Allocator>&& rhs);

Effects: Equivalent to:

lhs.append(rhs);
return std::move(lhs);

except that both lhs and rhs are left in valid but unspecified states. [Note: If lhs and rhs have equal allocators, the implementation may move from either. —end note]
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);

5  Effects: Equivalent to:
    basic_string<charT, traits, Allocator> r = rhs;
    r.insert(0, lhs);
    return r;

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(charT lhs, const basic_string<charT, traits, Allocator>& rhs);

6  Effects: Equivalent to:
    basic_string<charT, traits, Allocator> r = rhs;
    r.insert(r.begin(), lhs);
    return r;

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(charT lhs, basic_string<charT, traits, Allocator>&& rhs);

7  Effects: Equivalent to:
    rhs.insert(rhs.begin(), lhs);
    return std::move(rhs);

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);

8  Effects: Equivalent to:
    rhs.push_back(rhs);
    return std::move(lhs);

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, charT rhs);

9  Effects: Equivalent to:
    lhs.push_back(rhs);
    return std::move(lhs);

21.3.3.2 Non-member comparison functions

[string.cmp]

template<class charT, class traits, class Allocator>
constexpr bool
operator==(const basic_string<charT, traits, Allocator>& lhs,
            const basic_string<charT, traits, Allocator>& rhs) noexcept;

template<class charT, class traits, class Allocator>
constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
            const charT* rhs);

1  Effects: Let op be the operator. Equivalent to:
    return basic_string_view<charT, traits>(lhs) op basic_string_view<charT, traits>(rhs);
21.3.3.3 swap

```cpp
template<class charT, class traits, class Allocator>
constexpr void
    swap(basic_string<charT, traits, Allocator>& lhs,
         basic_string<charT, traits, Allocator>& rhs)
    noexcept(noexcept(lhs.swap(rhs)));
```

1 Effects: Equivalent to lhs.swap(rhs).

21.3.3.4 Inserters and extractors

```cpp
template<class charT, class traits, class Allocator>
    basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>&& is,
                   basic_string<charT, traits, Allocator>& str);
```

1 Effects: Behaves as a formatted input function (29.7.4.2.1). After constructing a sentry object, if the
sentry converts to true, calls str.erase() and then extracts characters from is and appends them to
str as if by calling str.append(1, c). If is.width() is greater than zero, the maximum number n
of characters appended is is.width(); otherwise n is str.max_size(). Characters are extracted and
appended until any of the following occurs:

1.1 n characters are stored;
1.2 end-of-file occurs on the input sequence;
1.3 isspace(c, is.getloc()) is true for the next available input character c.

2 After the last character (if any) is extracted, is.width(0) is called and the sentry object is destroyed.

3 If the function extracts no characters, it calls is.setstate(ios_base::failbit), which may throw
ios_base::failure (29.5.5.4).

4 Returns: is.

```cpp
template<class charT, class traits, class Allocator>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,
                   const basic_string<charT, traits, Allocator>& str);
```

5 Effects: Equivalent to: return os << basic_string_view<charT, traits>(str);

```cpp
template<class charT, class traits, class Allocator>
    basic_istream<charT, traits>&
        getline(basic_istream<charT, traits>& is,
                basic_string<charT, traits, Allocator>& str,
                charT delim);
```

6 Effects: Behaves as an unformatted input function (29.7.4.3), except that it does not affect the value
returned by subsequent calls to basic_istream<>::gcount(). After constructing a sentry object,
if the sentry converts to true, calls str.erase() and then extracts characters from is and appends
them to str as if by calling str.append(1, c) until any of the following occurs:

6.1 end-of-file occurs on the input sequence (in which case, the getline function calls is.setstate(
ios_base::eofbit)).
6.2 traits::eq(c, delim) for the next available input character c (in which case, c is extracted but
not appended) (29.5.5.4)
6.3 str.max_size() characters are stored (in which case, the function calls is.setstate(ios_base::failbit)) (29.5.5.4)

7 The conditions are tested in the order shown. In any case, after the last character is extracted, the
sentry object is destroyed.

8 If the function extracts no characters, it calls is.setstate(ios_base::failbit) which may throw
ios_base::failure (29.5.5.4).
Returns: `is`.

```cpp
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>& getline(basic_istream<charT, traits>&& is,
basic_string<charT, traits, Allocator>& str);
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>& getline(basic_istream<charT, traits>& is,
basic_string<charT, traits, Allocator>& str);
```

Returns: `getline(is, str, is.widen(‘\n’))`.

### 21.3.3.5 Erasure

```cpp
template<class charT, class traits, class Allocator, class U>
constexpr typename basic_string<charT, traits, Allocator>::size_type erase(basic_string<charT, traits, Allocator>& c, const U& value);
```

Effects: Equivalent to:
- `auto it = remove(c.begin(), c.end(), value);`
- `auto r = distance(it, c.end());`
- `c.erase(it, c.end());`
- `return r;`

```cpp
template<class charT, class traits, class Allocator, class Predicate>
constexpr typename basic_string<charT, traits, Allocator>::size_type erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);
```

Effects: Equivalent to:
- `auto it = remove_if(c.begin(), c.end(), pred);`
- `auto r = distance(it, c.end());`
- `c.erase(it, c.end());`
- `return r;`

### 21.3.4 Numeric conversions

```cpp
int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);
```

Effects: The first two functions call `strtol(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base)`, `strtol(str.c_str(), ptr, base)`, and `strtoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != 0`, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.

Throws: `invalid_argument` if `strtol`, `strtoul`, `strtol`, or `strtoull` reports that no conversion could be performed. Throws `out_of_range` if `strtol`, `strtoul`, `strtol` or `strtoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

```cpp
float stof(const string& str, size_t* idx = nullptr);
double stod(const string& str, size_t* idx = nullptr);
long double stold(const string& str, size_t* idx = nullptr);
```

Effects: These functions call `strtof(str.c_str(), ptr)`, `strtod(str.c_str(), ptr)`, and `strtohl(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != 0`, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.
Throws: invalid_argument if `strtof`, `strtod`, or `strtold` reports that no conversion could be performed. Throws out_of_range if `strtof`, `strtod`, or `strtold` sets `errno` to ERANGE or if the converted value is outside the range of representable values for the return type.

```cpp
string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(float val);
string to_string(double val);
string to_string(long double val);
```

Returns: Each function returns a `string` object holding the character representation of the value of its argument that would be generated by calling `sprintf(buf, fmt, val)` with a format specifier of `%d`, `%u`, `%ld`, `%lld`, `%f`, `%Lf`, or `%Lf`, respectively, where `buf` designates an internal character buffer of sufficient size.

```cpp
int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);
```

Effects: The first two functions call `wcstol(str.c_str(), ptr, base)`, and the last three functions call `wcstoul(str.c_str(), ptr, base)`, `wcstoll(str.c_str(), ptr, base)`, and `wcstoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx` != 0, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.

```cpp
float stof(const wstring& str, size_t* idx = nullptr);
double stod(const wstring& str, size_t* idx = nullptr);
long double stold(const wstring& str, size_t* idx = nullptr);
```

Effects: These functions call `wcstof(str.c_str(), ptr)`, `wcstod(str.c_str(), ptr)`, and `wcstold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx` != 0, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.

```cpp
wstring to_wstring(int val);
wstring to_wstring(unsigned val);
wstring to_wstring(long val);
wstring to_wstring(unsigned long val);
wstring to_wstring(long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
```

Returns: Each function returns a `wstring` object holding the character representation of the value of its argument that would be generated by calling `swprintf(buf, buffsz, fmt, val)` with a format specifier of L"%d", L"%u", L"%ld", L"%lld", L"%f", L"%Lf", or L"%Lf", respectively, where `buf` designates an internal character buffer of sufficient size `buffsz`. 

§ 21.3.4 ©ISO/IEC 2020 – All rights reserved 769
21.3.5 Hash support

```
template<> struct hash<string>;
template<> struct hash<u8string>;
template<> struct hash<u16string>;
template<> struct hash<u32string>;
template<> struct hash<wstring>;
template<> struct hash<pmr::string>;
template<> struct hash<pmr::u8string>;
template<> struct hash<pmr::u16string>;
template<> struct hash<pmr::u32string>;
template<> struct hash<pmr::wstring>;
```

1 If $S$ is one of these string types, $SV$ is the corresponding string view type, and $s$ is an object of type $S$, then $\text{hash}<S>()(s) == \text{hash}<SV>()(SV(s))$.

21.3.6 Suffix for basic_string literals

```
constexpr string operator"s(const char* str, size_t len);
Returns: string{str, len}.
```

1 Returns: string{str, len}.

```
constexpr u8string operator"s(const char8_t* str, size_t len);
Returns: u8string{str, len}.
```

2 Returns: u8string{str, len}.

```
constexpr u16string operator"s(const char16_t* str, size_t len);
Returns: u16string{str, len}.
```

3 Returns: u16string{str, len}.

```
constexpr u32string operator"s(const char32_t* str, size_t len);
Returns: u32string{str, len}.
```

4 Returns: u32string{str, len}.

```
constexpr wstring operator"s(const wchar_t* str, size_t len);
```

5 Returns: wstring{str, len}.

[Note: The same suffix $s$ is used for chrono::duration literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]

21.4 String view classes

The class template `basic_string_view` describes an object that can refer to a constant contiguous sequence of char-like (21.1) objects with the first element of the sequence at position zero. In the rest of this subclause, the type of the char-like objects held in a `basic_string_view` object is designated by `charT`.

[Note: The library provides implicit conversions from `const charT*` and `std::basic_string<charT, ...>` to `std::basic_string_view<charT, ...>` so that user code can accept just `std::basic_string_view<charT>` as a non-templated parameter wherever a sequence of characters is expected. User-defined types should define their own implicit conversions to `std::basic_string_view` in order to interoperate with these functions. — end note]

21.4.1 Header `<string_view>` synopsis

```
#include <compare>  // see 17.11.1

namespace std {

// 21.4.2, class template basic_string_view
template<class charT, class traits = char_traits<charT>>
class basic_string_view;

template<class charT, class traits>
inline constexpr bool ranges::enable_view<basic_string_view<charT, traits>> = true;
template<class charT, class traits>
inline constexpr bool ranges::enable_borrowed_range<basic_string_view<charT, traits>> = true;

```

private:
    const_pointer data_; // exposition only
    size_type size_;    // exposition only
};

// 21.4.3, deduction guide
template<class It, class End>
    basic_string_view(It begin, End end) -> basic_string_view<iter_value_t<It>>;

In every specialization basic_string_view<charT, traits>, the type traits shall meet the character traits requirements (21.2). [Note: The program is ill-formed if traits::char_type is not the same type as charT. — end note]

For a basic_string_view str, any operation that invalidates a pointer in the range [str.data(), str.data() + str.size()) invalidates pointers, iterators, and references returned from str's member functions.

The complexity of basic_string_view member functions is $O(1)$ unless otherwise specified.

21.4.2.1 Construction and assignment

constexpr basic_string_view() noexcept;

Postconditions: size_ == 0 and data_ == nullptr.

constexpr basic_string_view(const charT* str);

Preconditions: [str, str + traits::length(str)) is a valid range.

Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with traits::length(str).

Complexity: $O(\text{traits::length(str)})$.

constexpr basic_string_view(const charT* str, size_type len);

Preconditions: [str, str + len) is a valid range.

Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with len.

template<class It, class End>
    constexpr basic_string_view(It begin, End end);
It satisfies contiguous_iterator.

End satisfies sized_sentinel_for<It>.
is_same_v<iter_value_t<It>, charT> is true.
is_convertible_v<End, size_type> is false.

Preconditions:

[begin, end) is a valid range.
It models contiguous_iterator.
End models sized_sentinel_for<It>.

Effects: Initializes data_ with to_address(begin) and initializes size_ with end - begin.

21.4.2.2 Iterator support

using const_iterator = implementation-defined;

A type that meets the requirements of a constant Cpp17RandomAccessIterator (23.3.5.6), models contiguous_iterator (23.3.4.14), and meets the constexpr iterator requirements (23.3.1), whose value_type is the template parameter charT.

All requirements on container iterators (22.2) apply to basic_string_view::const_iterator as well.

constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;

Returns: An iterator such that

if !empty(), addressof(*begin()) == data_,
otherwise, an unspecified value such that [begin(), end()) is a valid range.

constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;

Returns: begin() + size().

constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;

Returns: const_reverse_iterator(end()).

constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

Returns: const_reverse_iterator(begin()).

21.4.2.3 Capacity

constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;

Returns: size_.

constexpr size_type max_size() const noexcept;
Returns: The largest possible number of char-like objects that can be referred to by a basic_string_view.

[nodiscard] constexpr bool empty() const noexcept;
Returns: size_ == 0.

21.4.2.4 Element access

constexpr const_reference operator[](size_type pos) const;

Preconditions: pos < size().
Returns: data_[pos].

Throws: Nothing.
constexpr const_reference at(size_type pos) const;

Throws: out_of_range if pos >= size().

Returns: data_[pos].

cconstexpr const_reference front() const;

Preconditions: !empty().

Returns: data_[0].

Throws: Nothing.

cconstexpr const_reference back() const;

Preconditions: !empty().

Returns: data_[size() - 1].

Throws: Nothing.

cconstexpr const_pointer data() const noexcept;

Returns: data_.

[Note: Unlike basic_string::data() and string-literals, data() may return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass data() to a function that takes just a const charT* and expects a null-terminated string. — end note]

21.4.2.5 Modifiers

constexpr void remove_prefix(size_type n);

Preconditions: n <= size().

Effects: Equivalent to: data_ += n; size_ -= n;

cconstexpr void remove_suffix(size_type n);

Preconditions: n <= size().

Effects: Equivalent to: size_ -= n;

cconstexpr void swap(basic_string_view& s) noexcept;

Effects: Exchanges the values of *this and s.

21.4.2.6 String operations

constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;

Let rlen be the smaller of n and size() - pos.

Throws: out_of_range if pos > size().

Preconditions: [s, s + rlen) is a valid range.

Effects: Equivalent to traits::copy(s, data() + pos, rlen).

Returns: rlen.

Complexity: \(O(rlen).\)

constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;

Let rlen be the smaller of n and size() - pos.

Throws: out_of_range if pos > size().

Effects: Determines rlen, the effective length of the string to reference.

Returns: basic_string_view(data() + pos, rlen).
constexpr int compare(basic_string_view str) const noexcept;
11
Let \( rlen \) be the smaller of \( \text{size()} \) and \( \text{str.size()} \).
12
**Effects:** Determines \( rlen \), the effective length of the strings to compare. The function then compares the two strings by calling \( \text{traits::compare(data(), str.data(), rlen)} \).
13
**Complexity:** \( \Theta(rlen) \).
14
**Returns:** The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 70.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \text{size()} &lt; \text{str.size()} )</td>
<td>(&lt; 0)</td>
</tr>
<tr>
<td>( \text{size()} == \text{str.size()} )</td>
<td>(0)</td>
</tr>
<tr>
<td>( \text{size()} &gt; \text{str.size()} )</td>
<td>(&gt; 0)</td>
</tr>
</tbody>
</table>

constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;
15
**Effects:** Equivalent to: \( \text{return substr(pos1, n1).compare(str)} \);
16
constexpr int compare(size_type pos1, size_type n1, basic_string_view str,
                        size_type pos2, size_type n2) const;
17
**Effects:** Equivalent to: \( \text{return substr(pos1, n1).compare(str.substr(pos2, n2))} \);
18
constexpr int compare(const charT* s) const;
19
**Effects:** Equivalent to: \( \text{return compare(basic_string_view(s))} \);
20
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
21
**Effects:** Equivalent to: \( \text{return substr(pos1, n1).compare(basic_string_view(s))} \);
22
constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;
23
**Effects:** Equivalent to: \( \text{return substr(pos1, n1).compare(basic_string_view(s, n2))} \);
24
constexpr bool starts_with(basic_string_view x) const noexcept;
25
**Effects:** Equivalent to: \( \text{return substr(0, x.size()) == x} \);
26
constexpr bool starts_with(charT x) const noexcept;
27
**Effects:** Equivalent to: \( \text{return !empty() \&\& traits::eq(front(), x)} \);
28
constexpr bool starts_with(const charT* x) const;
29
**Effects:** Equivalent to: \( \text{return starts_with(basic_string_view(x))} \);
30
constexpr bool ends_with(basic_string_view x) const noexcept;
31
**Effects:** Equivalent to: \( \text{return size() >= x.size() \&\& compare(size() - x.size(), npos, x) == 0} \);
32
constexpr bool ends_with(charT x) const noexcept;
33
**Effects:** Equivalent to: \( \text{return !empty() \&\& traits::eq(back(), x)} \);
34
constexpr bool ends_with(const charT* x) const;
35
**Effects:** Equivalent to: \( \text{return ends_with(basic_string_view(x))} \);
36

### 21.4.2.7 Searching

Member functions in this subclause have complexity \( \Theta(\text{size()} \times \text{str.size()}) \) at worst, although implementations should do better.

Let \( F \) be one of \( \text{find}, \text{rfind}, \text{find_first_of}, \text{find_last_of}, \text{find_first_not_of}, \text{and find_last_not_of} \).

(2.1) Each member function of the form

\[ \text{... \text{find}}(\ldots) \]
constexpr return-type F(const charT* s, size_type pos) const;
has effects equivalent to: return F(basic_string_view(s), pos);
(2.2)  — Each member function of the form
constexpr return-type F(const charT* s, size_type pos, size_type n) const;
has effects equivalent to: return F(basic_string_view(s, n), pos);
(2.3)  — Each member function of the form
constexpr return-type F(charT c, size_type pos) const noexcept;
has effects equivalent to: return F(basic_string_view(addressof(c), 1), pos);

constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;
3  Let xpos be the lowest position, if possible, such that the following conditions hold:
(3.1)  — pos <= xpos
(3.2)  — xpos + str.size() <= size()
(3.3)  — traits::eq(at(xpos + I), str.at(I)) for all elements I of the string referenced by str.
Effects: Determines xpos.
Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;
6  Let xpos be the highest position, if possible, such that the following conditions hold:
(6.1)  — xpos <= pos
(6.2)  — xpos + str.size() <= size()
(6.3)  — traits::eq(at(xpos + I), str.at(I)) for all elements I of the string referenced by str.
Effects: Determines xpos.
Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;
9  Let xpos be the lowest position, if possible, such that the following conditions hold:
(9.1)  — pos <= xpos
(9.2)  — xpos < size()
(9.3)  — traits::eq(at(xpos), str.at(I)) for some element I of the string referenced by str.
Effects: Determines xpos.
Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;
12  Let xpos be the highest position, if possible, such that the following conditions hold:
(12.1)  — xpos <= pos
(12.2)  — xpos < size()
(12.3)  — traits::eq(at(xpos), str.at(I)) for some element I of the string referenced by str.
Effects: Determines xpos.
Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;
15  Let xpos be the lowest position, if possible, such that the following conditions hold:
(15.1)  — pos <= xpos
(15.2)  — xpos < size()
(15.3)  — traits::eq(at(xpos), str.at(I)) for no element I of the string referenced by str.
Effects: Determines \(xpos\).

Returns: \(\text{npos}\) if the function can determine such a value for \(xpos\). Otherwise, returns \(\text{npos}\).

```cpp
cconstexpr size_type find_last_not_of(basic_string_view str, size_type pos = \text{npos}) const noexcept;
```

Let \(xpos\) be the highest position, if possible, such that the following conditions hold:

- (18.1) \(xpos \leq pos\)
- (18.2) \(xpos < \text{size()}\)
- (18.3) \(\text{traits::eq(at(xpos), str.at(I))}\) for no element \(I\) of the string referenced by \(\text{str}\).

Effects: Determines \(xpos\).

Returns: \(\text{npos}\) if the function can determine such a value for \(xpos\). Otherwise, returns \(\text{npos}\).

21.4.3 Deduction guide\[string.view.deduct\]

```cpp
template<class It, class End>
  basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
```

Constraints:

- (1.1) It satisfies \text{contiguous_iterator}.
- (1.2) End satisfies \text{sized_sentinel_for<It>}.

21.4.4 Non-member comparison functions\[string.view.comparison\]

Let \(S\) be basic_string_view\langle\text{charT}, \text{traits}\rangle, and \(\text{sv}\) be an instance of \(S\). Implementations shall provide sufficient additional overloads marked \text{constexpr} and \text{noexcept} so that an object \(t\) with an implicit conversion to \(S\) can be compared according to Table 71.

Table 71: Additional basic_string_view comparison overloads \[tab:string.view.comparison.overloads\]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Equivalent to</th>
</tr>
</thead>
<tbody>
<tr>
<td>(t == \text{sv})</td>
<td>(S(t) == \text{sv})</td>
</tr>
<tr>
<td>(\text{sv} == t)</td>
<td>(\text{sv} == S(t))</td>
</tr>
<tr>
<td>(t != \text{sv})</td>
<td>(S(t) !\neq \text{sv})</td>
</tr>
<tr>
<td>(\text{sv} \neq t)</td>
<td>(\text{sv} \neq S(t))</td>
</tr>
<tr>
<td>(t &lt; \text{sv})</td>
<td>(S(t) &lt; \text{sv})</td>
</tr>
<tr>
<td>(\text{sv} &lt; t)</td>
<td>(\text{sv} &lt; S(t))</td>
</tr>
<tr>
<td>(t &gt; \text{sv})</td>
<td>(S(t) &gt; \text{sv})</td>
</tr>
<tr>
<td>(\text{sv} &gt; t)</td>
<td>(\text{sv} &gt; S(t))</td>
</tr>
<tr>
<td>(t \leq \text{sv})</td>
<td>(S(t) \leq \text{sv})</td>
</tr>
<tr>
<td>(\text{sv} \leq t)</td>
<td>(\text{sv} \leq S(t))</td>
</tr>
<tr>
<td>(t \geq \text{sv})</td>
<td>(S(t) \geq \text{sv})</td>

<td>(\text{sv} \geq S(t))</td>
</tr>
<tr>
<td>(t \trianglerighteq \text{sv})</td>
<td>(S(t) \trianglerighteq \text{sv})</td>
</tr>
<tr>
<td>(\text{sv} \trianglerighteq t)</td>
<td>(\text{sv} \trianglerighteq S(t))</td>
</tr>
</tbody>
</table>

[Example: A sample conforming implementation for \text{operator==} would be:

```cpp
template<class charT, class traits>
  constexpr bool operator==(basic_string_view<charT, traits> lhs,
  basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
  }
```

```cpp
template<class charT, class traits>
  constexpr bool operator==(basic_string_view<charT, traits> lhs,
  type_identity_t<basic_string_view<charT, traits>> rhs) noexcept {
    return lhs.compare(rhs) == 0;
  }
```

—end example]
template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
  basic_string_view<charT, traits> rhs) noexcept;

Returns: lhs.compare(rhs) == 0.

template<class charT, class traits>
constexpr see below operator<=>(basic_string_view<charT, traits> lhs,
  basic_string_view<charT, traits> rhs) noexcept;

Let R denote the type traits::comparison_category if it exists, otherwise R is weak_ordering.

Returns: static_cast<R>(lhs.compare(rhs) <=> 0).

21.4.5 Inserters and extractors [string.view.io]

template<class charT, class traits>
  basic_ostream<charT, traits>&
  operator<<(basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);

Effects: Behaves as a formatted output function (29.7.5.2.1) of os. Forms a character sequence seq,
initially consisting of the elements defined by the range [str.begin(), str.end()). Determines
padding for seq as described in 29.7.5.2.1. Then inserts seq as if by calling os.rdbuf()->sputn(seq,
n), where n is the larger of os.width() and str.size(); then calls os.width(0).

Returns: os

21.4.6 Hash support [string.view.hash]

template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;
1
The specialization is enabled (20.14.18). [Note: The hash value of a string view object is equal to the
hash value of the corresponding string object (21.3.5). — end note]

21.4.7 Suffix for basic_string_view literals [string.view.literals]

constexpr string_view operator"sv(const char* str, size_t len) noexcept;
1
Returns: string_view(str, len).

cconstexpr u8string_view operator"sv(const char8_t* str, size_t len) noexcept;
2
Returns: u8string_view(str, len).

cconstexpr u16string_view operator"sv(const char16_t* str, size_t len) noexcept;
3
Returns: u16string_view(str, len).

cconstexpr u32string_view operator"sv(const char32_t* str, size_t len) noexcept;
4
Returns: u32string_view(str, len).

cconstexpr wstring_view operator"sv(const wchar_t* str, size_t len) noexcept;
5
Returns: wstring_view(str, len).

21.5 Null-terminated sequence utilities [c.strings]

21.5.1 Header <cctype> synopsis [cctype.syn]

namespace std {
  int isalnum(int c);
  int isalpha(int c);
  int isblank(int c);
  int iscntrl(int c);
  int isdigit(int c);
  int isgraph(int c);
  int islower(int c);
}
int isprint(int c);
int ispunct(int c);
int isspace(int c);
int isupper(int c);
int isxdigit(int c);
int tolower(int c);
int toupper(int c);

1 The contents and meaning of the header `<cctype>` are the same as the C standard library header `<ctype.h>`.

See also: ISO C 7.4

21.5.2 Header `<cwctype>` synopsis

namespace std {

using wint_t = see below;
using wctrans_t = see below;
using wctype_t = see below;

int iswalnum(wint_t wc);
int iswalpha(wint_t wc);
int iswblank(wint_t wc);
int iswcntrl(wint_t wc);

§ 21.5.5 ©ISO/IEC 2020 – All rights reserved 782
The contents and meaning of the header `<cuchar>` are the same as the C standard library header `<uchar.h>`, except that it declares the additional `mbtocr8` and `c8rtomb` functions and does not declare types `char16_t` nor `char32_t`.

See also: ISO C 7.28

## 21.5.6 Multibyte / wide string and character conversion functions [c.mb.wcs]

### Notes
The headers `<cstdlib>` (17.2.2), `<cuchar>` (21.5.5), and `<cwchar>` (21.5.4) declare the functions described in this subclause. — end note

```c
int mbsinit(const mbstate_t* ps);
int mblen(const char* s, size_t n);
size_t mbstowcs(wchar_t* pwcs, const char* s, size_t n);
size_t wcstombs(char* s, const wchar_t* pwcs, size_t n);
```

**Effects:** These functions have the semantics specified in the C standard library.

See also: ISO C 7.22.7.1, 7.22.8, 7.29.6.2.1

```c
int mbtowc(wchar_t* pwc, const char* s, size_t n);
int wctomb(char* s, wchar_t wchar);
```

**Effects:** These functions have the semantics specified in the C standard library.

**Remarks:** Calls to these functions may introduce a data race (16.5.5.10) with other calls to the same function.

See also: ISO C 7.22.7

```c
size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
size_t mbrtowc(wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wcrtomb(char* s, wchar_t wc, mbstate_t* ps);
size_t mbrtowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);
```

**Effects:** These functions have the semantics specified in the C standard library.

**Remarks:** Calling these functions with an `mbstate_t*` argument that is a null pointer value may introduce a data race (16.5.5.10) with other calls to the same function with an `mbstate_t*` argument that is a null pointer value.

See also: ISO C 7.29.6.3

```c
size_t mbrtoc8(char8_t* p, const char* s, size_t n, mbstate_t* ps);
```

**Effects:** If `s` is a null pointer, equivalent to `mbrtoc8(nullptr, "", 1, ps)`. Otherwise, the function inspects at most `n` bytes beginning with the byte pointed to by `s` to determine the number of bytes needed to complete the next multibyte character (including any shift sequences). If the function determines that the next multibyte character is complete and valid, it determines the values of the corresponding UTF-8 code units and then, if `p` is not a null pointer, stores the value of the first (or only) such code unit in the object pointed to by `p`. Subsequent calls will store successive UTF-8 code units without consuming any additional input until all the code units have been stored. If the corresponding Unicode character is U+0000, the resulting state described is the initial conversion state.

**Returns:** The first of the following that applies (given the current conversion state):

1. `0`, if the next `n` or fewer bytes complete the multibyte character that corresponds to the U+0000 Unicode character (which is the value stored).
2. Between 1 and `n` (inclusive), if the next `n` or fewer bytes complete a valid multibyte character (which is the value stored); the value returned is the number of bytes that complete the multibyte character.
3. `(size_t)(-3)`, if the next character resulting from a previous call has been stored (no bytes from the input have been consumed by this call).
4. `(size_t)(-2)`, if the next `n` bytes contribute to an incomplete (but potentially valid) multibyte character, and all `n` bytes have been processed (no value is stored).
— \((\text{size\_t})(-1)\), if an encoding error occurs, in which case the next \(n\) or fewer bytes do not contribute to a complete and valid multibyte character (no value is stored); the value of the macro \(\text{EILSEQ}\) is stored in \(\text{errno}\), and the conversion state is unspecified.

\begin{verbatim}
size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
\end{verbatim}

\textbf{Effects:} If \(s\) is a null pointer, equivalent to \(\text{c8rtomb(buf, u8'\0', ps)}\) where \(\text{buf}\) is an internal buffer. Otherwise, if \(c8\) completes a sequence of valid UTF-8 code units, determines the number of bytes needed to represent the multibyte character (including any shift sequences), and stores the multibyte character representation in the array whose first element is pointed to by \(s\). At most \(\text{MB\_CUR\_MAX}\) bytes are stored. If the multibyte character is a null character, a null byte is stored, preceded by any shift sequence needed to restore the initial shift state; the resulting state described is the initial conversion state.

\textbf{Returns:} The number of bytes stored in the array object (including any shift sequences). If \(c8\) does not contribute to a sequence of \text{char8\_t} corresponding to a valid multibyte character, the value of the macro \(\text{EILSEQ}\) is stored in \(\text{errno}\), \((\text{size\_t})(-1)\) is returned, and the conversion state is unspecified.

\textbf{Remarks:} Calls to \text{c8rtomb} with a null pointer argument for \(s\) may introduce a data race (16.5.5.10) with other calls to \text{c8rtomb} with a null pointer argument for \(s\).
22 Containers library

22.1 General

1 This Clause describes components that C++ programs may use to organize collections of information.

2 The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in Table 72.

22.2 Container requirements

22.2.1 General container requirements

1 Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.

2 All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects. [Example: The copy constructor of type vector<vector<int>> has linear complexity, even though the complexity of copying each contained vector<int> is itself linear. —end example]

3 For the components affected by this subclause that declare an allocator_type, objects stored in these components shall be constructed using the function allocator_traits<allocator_type>::rebind_traits<U>::construct and destroyed using the function allocator_traits<allocator_type>::rebind_traits<U>::destroy (20.10.9.2), where U is either allocator_type::value_type or an internal type used by the container. These functions are called only for the container's element type, not for internal types used by the container. [Note: This means, for example, that a node-based container might need to construct nodes containing aligned buffers and call construct to place the element into the buffer. —end note]

4 In Tables 73, 74, and 75 X denotes a container class containing objects of type T, a and b denote values of type X, i and j denote values of type (possibly const) X::iterator, u denotes an identifier, r denotes a non-const value of type X, and rv denotes a non-const rvalue of type X.

</tr>
</tbody>
</table>

Those entries marked “(Note A)” or “(Note B)” have linear complexity for array and have constant complexity for all other standard containers. [Note: The algorithm equal() is defined in Clause 25. — end note]

5 The member function size() returns the number of elements in the container. The number of elements is defined by the rules of constructors, inserts, and erases.

6 begin() returns an iterator referring to the first element in the container. end() returns an iterator which is the past-the-end value for the container. If the container is empty, then begin() == end().

7 In the expressions

i == j
i != j
i < j
i <= j
i >= j
i > j
i <=> j
i - j

where i and j denote objects of a container’s iterator type, either or both may be replaced by an object of the container’s const_iterator type referring to the same element with no change in semantics.

8 Unless otherwise specified, all containers defined in this clause obtain memory using an allocator (see 16.5.3.5). [Note: In particular, containers and iterators do not store references to allocated elements other than through the allocator’s pointer type, i.e., as objects of type P or pointer_traits<P>::template rebind<unspecified>, where P is allocator_traits<allocator_type>::pointer. — end note] Copy constructors for these container types obtain an allocator by calling allocator_traits<allocator_type>::select_on_container_copy_construction on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container...

§ 22.2.1 ©ISO/IEC 2020 – All rights reserved 787
being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a \texttt{const allocator\_type} argument. [Note: If an invocation of a constructor uses the default value of an optional allocator argument, then the allocator type must support value-initialization. — end note] A copy of this allocator is used for any memory allocation and element construction performed, by these constructors and by all member functions, during the lifetime of each container object or until the allocator is replaced. The allocator may be replaced only via assignment or \texttt{swap()}. Allocator replacement is performed by copy assignment, move assignment, or swapping of the allocator only if \texttt{allocator\_traits<allocator\_type>::propagate\_on\_container\_move\_assignment::value}, \texttt{allocator\_traits<allocator\_type>::propagate\_on\_container\_swap::value} is \texttt{true} within the implementation of the corresponding container operation. In all container types defined in this Clause, the member \texttt{get\_allocator()} returns a copy of the allocator used to construct the container or, if that allocator has been replaced, a copy of the most recent replacement.

The expression \texttt{a.swap(b)}, for containers \texttt{a} and \texttt{b} of a standard container type other than \texttt{array}, shall exchange the values of \texttt{a} and \texttt{b} without invoking any move, copy, or swap operations on the individual container elements. Values of any \texttt{Compare}, \texttt{Pred}, or \texttt{Hash} types belonging to \texttt{a} and \texttt{b} shall be swappable and shall be exchanged by calling \texttt{swap} as described in 16.5.3.2. If \texttt{allocator\_traits<allocator\_type>::propagate\_on\_container\_swap::value} is \texttt{true}, then values of type \texttt{allocator\_type} shall be swappable and the allocators of \texttt{a} and \texttt{b} shall also be exchanged by calling \texttt{swap} as described in 16.5.3.2. Otherwise, the allocators shall not be swapped, and the behavior is undefined unless \texttt{a.get\_allocator() == b.get\_allocator()}. Every iterator referring to an element in one container before the swap shall refer to the same element in the other container after the swap. It is unspecified whether an iterator with value \texttt{a.end()} before the swap will have value \texttt{b.end()} after the swap.

If the iterator type of a container belongs to the bidirectional or random access iterator categories (23.3), the container is called \textit{reversible} and meets the additional requirements in Table 74.

Table 74: Reversible container requirements

<td>constant</td>
</tr>
</tbody>
</table>

Unless otherwise specified (see 22.2.6.1, 22.2.7.1, 22.3.8.4, and 22.3.11.5) all container types defined in this Clause meet the following additional requirements:

11.1 — if an exception is thrown by an \texttt{insert()} or \texttt{emplace()} function while inserting a single element, that function has no effects.

11.2 — if an exception is thrown by a \texttt{push\_back()}, \texttt{push\_front()}, \texttt{emplace\_back()}, or \texttt{emplace\_front()} function, that function has no effects.

11.3 — no \texttt{erase()}, \texttt{clear()}, \texttt{pop\_back()} or \texttt{pop\_front()} function throws an exception.

11.4 — no copy constructor or assignment operator of a returned iterator throws an exception.

11.5 — no \texttt{swap()} function throws an exception.
— no \texttt{swap()} function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped. \textit{[Note: The \texttt{end()} iterator does not refer to any element, so it may be invalidated. — end note]}

12 Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.

13 A \textit{contiguous container} is a container whose member types \texttt{iterator} and \texttt{const iterator} meet the \texttt{Cpp17RandomAccessIterator} requirements (23.3.5.6) and model \texttt{contiguous_iterator} (23.3.4.14).

14 Table 75 lists operations that are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics described in Table 75 unless otherwise stated. If the iterators passed to \texttt{lexicographical\_compare\_three\_way} meet the \texttt{constexpr} iterator requirements (23.3.1) then the operations described in Table 75 are implemented by \texttt{constexpr} functions.

Table 75: Optional container operations  

<table>
<thead>

<td>\texttt{Preconditions: Either} \texttt{&lt;&gt; is defined for values of type (possibly const) T, or &lt; is defined for values of type (possibly const) T and &lt; is a total ordering relationship.}</td>
<td>linear</td>
</tr>
</tbody>
</table>

\textit{[Note: The algorithm \texttt{lexicographical\_compare\_three\_way} is defined in Clause 25. — end note]}

15 All of the containers defined in this Clause and in 21.3.2 except \texttt{array} meet the additional requirements of an allocator-aware container, as described in Table 76.

Given an allocator type \texttt{A} and given a container type \texttt{X} having a \texttt{value\_type} identical to \texttt{T} and an \texttt{allocator\_type} identical to \texttt{allocator\_traits<\texttt{A}>::rebind\_alloc\<\texttt{T}\>} and given an lvalue \texttt{m} of type \texttt{A}, a pointer \texttt{p} of type \texttt{T\*}, an expression \texttt{v} of type (possibly const) \texttt{T}, and an rvalue \texttt{rv} of type \texttt{T}, the following terms are defined. If \texttt{X} is not allocator-aware, the terms below are defined as if \texttt{A} were \texttt{allocator\<\texttt{T}\>} — no allocator object needs to be created and user specializations of \texttt{allocator\<\texttt{T}\>} are not instantiated:

\texttt{(15.1)} — \texttt{T} is \texttt{Cpp17Default\_Insertable into \texttt{X}} means that the following expression is well-formed:
\[
\text{\texttt{allocator\_traits<\texttt{A}>::construct(m, p)}}
\]

\texttt{(15.2)} — An element of \texttt{X} is \texttt{default-inserted} if it is initialized by evaluation of the expression
\[
\text{\texttt{allocator\_traits<\texttt{A}>::construct(m, p)}}
\]

where \texttt{p} is the address of the uninitialized storage for the element allocated within \texttt{X}.

\texttt{(15.3)} — \texttt{T} is \texttt{Cpp17Move\_Insertable into \texttt{X}} means that the following expression is well-formed:
\[
\text{\texttt{allocator\_traits<\texttt{A}>::construct(m, p, rv)}}
\]

and its evaluation causes the following postcondition to hold: The value of \texttt{*p} is equivalent to the value of \texttt{rv} before the evaluation. \textit{[Note: \texttt{rv} remains a valid object. Its state is unspecified. — end note]}

\texttt{(15.4)} — \texttt{T} is \texttt{Cpp17Copy\_Insertable into \texttt{X}} means that, in addition to \texttt{T} being \texttt{Cpp17Move\_Insertable into \texttt{X}}, the following expression is well-formed:
\[
\text{\texttt{allocator\_traits<\texttt{A}>::construct(m, p, v)}}
\]

and its evaluation causes the following postcondition to hold: The value of \texttt{v} is unchanged and is equivalent to \texttt{*p}.

\texttt{(15.5)} — \texttt{T} is \texttt{Cpp17Emplace\_Constructible into \texttt{X} from \texttt{args}}, for zero or more arguments \texttt{args}, means that the following expression is well-formed:
\[
\text{\texttt{allocator\_traits<\texttt{A}>::construct(m, p, args)}}
\]
This `Cpp17Erasable from X` means that the following expression is well-formed:

`allocator_traits<A>::destroy(m, p)`

[Note: A container calls `allocator_traits<A>::construct(m, p, args)` to construct an element at `p` using `args`, with `m == get_allocator()`. The default construct in allocator will call `::new((void*)p) T(args)`., but specialized allocators may choose a different definition. — end note]

In Table 76, `X` denotes an allocator-aware container class with a `value_type` of `T` using allocator of type `A`, `u` denotes a variable, `a` and `b` denote non-const lvalues of type `X`, `t` denotes an lvalue or a const rvalue of type `X`, `rv` denotes a non-const rvalue of type `X`, and `m` is a value of type `A`.

1 The behavior of certain container member functions and deduction guides depends on whether types qualify as input iterators or allocators. The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators. Likewise, the extent to which an implementation determines that a type cannot be an allocator is unspecified, except that as a minimum a type A shall not qualify as an allocator unless it meets both of the following conditions:

17.1 — The qualified-id A::value_type is valid and denotes a type (13.10.2).

17.2 — The expression declval<A&>().allocate(size_t{}) is well-formed when treated as an unevaluated operand.

22.2.2 Container data races  

For purposes of avoiding data races (16.5.5.10), implementations shall consider the following functions to be const: begin, end, rbegin, rend, front, back, data, find, lower_bound, upper_bound, equal_range, at and, except in associative or unordered associative containers, operator[].

Notwithstanding 16.5.5.10, implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting vector<bool>, are modified concurrently.

[Note: For a vector<int> x with a size greater than one, x[1] = 5 and *x.begin() = 10 can be executed concurrently without a data race, but x[0] = 5 and *x.begin() = 10 executed concurrently may result in a data race. As an exception to the general rule, for a vector<bool> y, y[0] = true may race with y[1] = true. — end note]

22.2.3 Sequence containers  

A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides four basic kinds of sequence containers: vector, forward_list, list, and deque. In addition, array is provided as a sequence container which provides limited sequence operations because it has a fixed number of elements. The library also provides container adaptors that make it easy to construct abstract data types, such as stacks or queues, out of the basic sequence container kinds (or out of other kinds of sequence containers that the user might define).

[Note: The sequence containers offer the programmer different complexity trade-offs and should be used accordingly. vector is the type of sequence container that should be used by default. array should be used when the container has a fixed size known during translation. list or forward_list should be used when there are frequent insertions and deletions from the middle of the sequence. deque is the data structure of choice when most insertions and deletions take place at the beginning or at the end of the sequence. When choosing a container, remember vector is best; leave a comment to explain if you choose from the rest! — end note]
In Tables 77 and 78, X denotes a sequence container class, a denotes a value of type X containing elements of type T, u denotes the name of a variable being declared, A denotes X::allocator_type if the qualified-id X::allocator_type is valid and denotes a type (13.10.2) and allocator<T> if it doesn’t, i and j denote iterators that meet the Cpp17InputIterator requirements and refer to elements implicitly convertible to value_type, [i, j) denotes a valid range, il designates an object of type initializer_list<value_type>, n denotes a value of type X::size_type, p denotes a valid constant iterator to a, q denotes a valid dereferenceable constant iterator to a, [q1, q2) denotes a valid range of constant iterators in a, t denotes an lvalue or a const rvalue of X::value_type, and rv denotes a non-const rvalue of X::value_type. Args denotes a template parameter pack; args denotes a function parameter pack with the pattern Args&&.

The complexities of the expressions are sequence dependent.

The complexities of the expressions are sequence dependent.

Invalidates all references, pointers and iterators referring to the elements of a. For vector and deque, also invalidates the past-the-end iterator.</td>
<td></td>
</tr>
</tbody>
</table>

5 The iterator returned from a.insert(p, t) points to the copy of t inserted into a.
6 The iterator returned from a.insert(p, rv) points to the copy of rv inserted into a.
The iterator returned from `a.insert(p, n, t)` points to the copy of the first element inserted into `a`, or `p` if `n == 0`.

The iterator returned from `a.insert(p, i, j)` points to the copy of the first element inserted into `a`, or `p` if `i == j`.

The iterator returned from `a.insert(p, il)` points to the copy of the first element inserted into `a`, or `p` if `il` is empty.

The iterator returned from `a.emplace(p, args)` points to the new element constructed from `args` into `a`.

The iterator returned from `a.erase(q)` points to the element immediately following `q` prior to the element being erased. If no such element exists, `a.end()` is returned.

The iterator returned by `a.erase(q1, q2)` points to the element pointed to by `q2` prior to any elements being erased. If no such element exists, `a.end()` is returned.

For every sequence container defined in this Clause and in Clause 21:

(13.1) — If the constructor

```cpp
template<class InputIterator>
X(InputIterator first, InputIterator last,
   const allocator_type& alloc = allocator_type());
```

is called with a type `InputIterator` that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.

(13.2) — If the member functions of the forms:

```cpp
template<class InputIterator>
return-type F(const_iterator p,
   InputIterator first, InputIterator last); // such as insert
```

```cpp
template<class InputIterator>
return-type F(InputIterator first, InputIterator last); // such as append, assign
```

```cpp
template<class InputIterator>
return-type F(const_iterator il, const_iterator i2,
   InputIterator first, InputIterator last); // such as replace
```

are called with a type `InputIterator` that does not qualify as an input iterator, then these functions shall not participate in overload resolution.

(13.3) — A deduction guide for a sequence container shall not participate in overload resolution if it has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter, or if it has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

Table 78 lists operations that are provided for some types of sequence containers but not others. An implementation shall provide these operations for all container types shown in the “container” column, and shall implement them so as to take amortized constant time.

</tbody>
</table>

15 The member function `at()` provides bounds-checked access to container elements. `at()` throws `out_of_range` if n >= a.size().

22.2.4 Node handles

22.2.4.1 Overview

A node handle is an object that accepts ownership of a single element from an associative container (22.2.6) or an unordered associative container (22.2.7). It may be used to transfer that ownership to another container with compatible nodes. Containers with compatible nodes have the same node handle type. Elements may be transferred in either direction between container types in the same row of Table 79.
Table 79: Container types with compatible nodes

2 If a node handle is not empty, then it contains an allocator that is equal to the allocator of the container when the element was extracted. If a node handle is empty, it contains no allocator.

3 Class node-handle is for exposition only.

4 If a user-defined specialization of pair exists for pair<const Key, T> or pair<Key, T>, where Key is the container’s key_type and T is the container’s mapped_type, the behavior of operations involving node handles is undefined.

```cpp
template<unspeicified>
class node-handle {
public:
    // These type declarations are described in Tables 80 and 81.
    using value_type = see below; // not present for map containers
    using key_type = see below;  // not present for set containers
    using mapped_type = see below; // not present for set containers
    using allocator_type = see below;

private:
    using container_node_type = unspecified;
    using ator_traits = allocator_traits<allocator_type>;

    typename ator_traits::template rebind_traits<container_node_type>::pointer ptr_;
    optional<allocator_type> alloc_;

public:
    // 22.2.4.2, constructors, copy, and assignment
    constexpr node-handle() noexcept : ptr_(), alloc_() {}
    node-handle(node-handle&&) noexcept;
    node-handle& operator=(node-handle&&);  

    // 22.2.4.3, destructor
    ~node-handle();

    // 22.2.4.4, observers
    value_type& value() const;  // not present for map containers
    key_type& key() const;     // not present for set containers
    mapped_type& mapped() const; // not present for set containers

    allocator_type get_allocator() const;
    explicit operator bool() const noexcept;
    [[nodiscard]] bool empty() const noexcePt;

    // 22.2.4.5, modifiers
    void swap(node-handle&);
    noexcept(ator_traits::propagate_on_container_swap::value ||
        ator_traits::is_always_equal::value);

    friend void swap(node-handle x, node-handle y) noexcept(noexcept(x.swap(y))) {
        x.swap(y);
    }
};

§ 22.2.4.1 ©ISO/IEC 2020 – All rights reserved
22.2.4.2 Constructors, copy, and assignment

\texttt{node-handle(node-handle\&\& nh) noexcept;}

\texttt{Effects:} Constructs a \texttt{node-handle} object initializing \texttt{ptr_} with \texttt{nh.ptr_}. Move constructs \texttt{alloc_} with \texttt{nh.alloc_}. Assigns \texttt{nullptr} to \texttt{nh.ptr_} and assigns \texttt{nullopt} to \texttt{nh.alloc_}.

\texttt{node-handle\& operator=(node-handle\&\& nh);}  

\texttt{Preconditions:} Either \texttt{!alloc_}, or \texttt{ator_traits::propagate_on_container_move_assignment::value} is \texttt{true}, or \texttt{alloc_ == nh.alloc_}.

\texttt{Effects:}

\begin{enumerate}
\item If \texttt{ptr_ \neq nullptr}, destroys the \texttt{value_type} subobject in the \texttt{container_node_type} object pointed to by \texttt{ptr_} by calling \texttt{ator_traits::destroy}, then deallocates \texttt{ptr_} by calling \texttt{ator_traits::template rebind_traits<container_node_type>::deallocate}.
\item Assigns \texttt{nh.ptr_} to \texttt{ptr_}.
\item If \texttt{!alloc_} or \texttt{ator_traits::propagate_on_container_move_assignment::value} is \texttt{true}, move assigns \texttt{nh.alloc_} to \texttt{alloc_}.
\item Assigns \texttt{nullptr} to \texttt{nh.ptr_} and assigns \texttt{nullopt} to \texttt{nh.alloc_}.
\end{enumerate}

\texttt{Returns: *this.}

\texttt{Throws: Nothing.}

22.2.4.3 Destructor

\texttt{~node-handle();}

\texttt{Effects:} If \texttt{ptr_ \neq nullptr}, destroys the \texttt{value_type} subobject in the \texttt{container_node_type} object pointed to by \texttt{ptr_} by calling \texttt{ator_traits::destroy}, then deallocates \texttt{ptr_} by calling \texttt{ator_traits::template rebind_traits<container_node_type>::deallocate}.

22.2.4.4 Observers

\texttt{value_type\& value() const;}

\texttt{Preconditions: empty() == false.}

\texttt{Returns:} A reference to the \texttt{value_type} subobject in the \texttt{container_node_type} object pointed to by \texttt{ptr_}.

\texttt{Throws: Nothing.}

\texttt{key_type\& key() const;}

\texttt{Preconditions: empty() == false.}

\texttt{Returns:} A non-const reference to the \texttt{key_type} member of the \texttt{value_type} subobject in the \texttt{container_node_type} object pointed to by \texttt{ptr_}.

\texttt{Throws: Nothing.}

\texttt{Remarks: Modifying the key through the returned reference is permitted.}

\texttt{mapped_type\& mapped() const;}

\texttt{Preconditions: empty() == false.}

\texttt{Returns:} A reference to the \texttt{mapped_type} member of the \texttt{value_type} subobject in the \texttt{container_node_type} object pointed to by \texttt{ptr_}.

\texttt{Throws: Nothing.}

\texttt{allocator_type get_allocator() const;}

\texttt{Preconditions: empty() == false.}

\texttt{Returns: *alloc_.}

\texttt{Throws: Nothing.}
explicit operator bool() const noexcept;
    Returns: ptr_ != nullptr.
[[nodiscard]] bool empty() const noexcept;
    Returns: ptr_ == nullptr.

22.2.4.5 Modifiers

void swap(node-handle& nh)
    noexcept(ator_traits::propagate_on_container_swap::value ||
            ator_traits::is_always_equal::value);
    Preconditions: !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap::value
                    is true, or alloc_ == nh.alloc_.
    Effects: Calls swap(ptr_, nh.ptr_). If !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap::value
             is true calls swap(alloc_, nh.alloc_).

22.2.5 Insert return type

1 The associative containers with unique keys and the unordered containers with unique keys have a member
    function insert that returns a nested type insert_return_type. That return type is a specialization of
    the template specified in this subclause.

    template<class Iterator, class NodeType>
    struct insert-return-type
    {
        Iterator position;
        bool inserted;
        NodeType node;
    };

2 The name insert-return-type is exposition only. insert-return-type has the template parameters,
    data members, and special members specified above. It has no base classes or members other than those
    specified.

22.2.6 Associative containers

1 Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of
    associative containers: set, multiset, map and multimap.

2 Each associative container is parameterized on Key and an ordering relation Compare that induces a strict
    weak ordering (25.8) on elements of Key. In addition, map and multimap associate an arbitrary mapped type
    T with the Key. The object of type Compare is called the comparison object of a container.

3 The phrase “equivalence of keys” means the equivalence relation imposed by the comparison object. That
    is, two keys k1 and k2 are considered to be equivalent if for the comparison object comp, comp(k1, k2)
    == false && comp(k2, k1) == false. [Note: This is not necessarily the same as the result of k1 == k2. —end
    note] For any two keys k1 and k2 in the same container, calling comp(k1, k2) shall always return the
    same value.

4 An associative container supports unique keys if it may contain at most one element for each key. Otherwise,
    it supports equivalent keys. The set and map classes support unique keys; the multiset and multimap
    classes support equivalent keys. For multiset and multimap, insert, emplace, and erase preserve the
    relative ordering of equivalent elements.

5 For set and multiset the value type is the same as the key type. For map and multimap it is equal to
    pair<const Key, T>.

6 iterator of an associative container is of the bidirectional iterator category. For associative containers
    where the value type is the same as the key type, both iterator and const_iterator are constant iterators.
    It is unspecified whether or not iterator and const_iterator are the same type. [Note: iterator and
    const_iterator have identical semantics in this case, and iterator is convertible to const_iterator.
    Users can avoid violating the one-definition rule by always using const_iterator in their function parameter
    lists. —end note]

7 The associative containers meet all the requirements of Allocator-aware containers (22.2.1), except that
    for map and multimap, the requirements placed on value_type in Table 76 apply instead to key_type
and mapped_type. [Note: For example, in some cases key_type and mapped_type are required to be Cpp17CopyAssignable even though the associated value_type, pair<const key_type, mapped_type>, is not Cpp17CopyAssignable. — end note] In Table 80, X denotes an associative container class, a denotes a value of type X, a2 denotes a value of a type with nodes compatible with type X (Table 79), b denotes a possibly const value of type X, u denotes the name of a variable being declared, a_uniq denotes a value of type X when X supports unique keys, a_eq denotes a value of type X when X supports multiple keys, a_tran denotes a possibly const value of type X when the qualified-id X::key_compare::is_transparent is valid and denotes a type (13.10.2), i and j meet the Cpp17InputIterator requirements and refer to elements implicitly convertible to value_type, [i, j) denotes a valid range, p denotes a valid constant iterator to a, q denotes a valid dereferenceable constant iterator to a, r denotes a valid dereferenceable iterator to a, [q1, q2) denotes a valid range of constant iterators in a, il designates an object of type initializer_list<value_type>, t denotes a value of type X::value_type, k denotes a value of type X::key_type and c denotes a possibly const value of type X::key_compare; kl is a value such that a is partitioned (25.8) with respect to c(r, kl), with r the key value of e and e in a; ku is a value such that a is partitioned with respect to !c(ku, r); ke is a value such that a is partitioned with respect to c(r, ke) and !c(ke, r), with c(r, ke) implying !c(ke, r). A denotes the storage allocator used by X, if any, or allocator<X::value_type> otherwise, m denotes an allocator of a type convertible to X, id designates an object of type initializer_list<value_type>, t denotes a value of type X::value_type, k denotes a value of type X::key_type and c denotes a possibly const value of type X::key_compare; kl is a value such that a is partitioned (25.8) with respect to c(r, kl), with r the key value of e and e in a; ku is a value such that a is partitioned with respect to !c(ku, r); ke is a value such that a is partitioned with respect to c(r, ke) and !c(ke, r), with c(r, ke) implying !c(ke, r). A denotes the storage allocator used by X, if any, or allocator<X::value_type> otherwise, m denotes an allocator of a type convertible to X, and nh denotes a non-const rvalue of type X::node_type.

</tr>
</tbody>
</table>

9 The **insert** and **emplace** members shall not affect the validity of iterators and references to the container, and the **erase** members shall invalidate only iterators and references to the erased elements.

10 The **extract** members invalidate only iterators to the removed element; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a **node_type** is undefined behavior. References and pointers to an element obtained while it is owned by a **node_type** are invalidated if the element is successfully inserted.

11 The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to construct them. For any two dereferenceable iterators i and j such that distance from i to j is positive, the following condition holds:

\[
\text{value_comp}(*j, *i) = \text{false}
\]

12 For associative containers with unique keys the stronger condition holds:

\[
\text{value_comp}(*i, *j) \neq \text{false}
\]

13 When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, through either a copy constructor or an assignment operator, the target container shall...
The member function templates `find`, `count`, `contains`, `lower_bound`, `upper_bound`, and `equal_range` shall not participate in overload resolution unless the qualified-id `Compare::is_transparent` is valid and denotes a type (13.10.2).

A deduction guide for an associative container shall not participate in overload resolution if any of the following are true:

1. It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
2. It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.
3. It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

### 22.2.6.1 Exception safety guarantees

For associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container’s `Compare` object (if any).

For associative containers, if an exception is thrown by any operation from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.

For associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container’s `Compare` object (if any).

### 22.2.7 Unordered associative containers

Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: `unordered_set`, `unordered_map`, `unordered_multiset`, and `unordered_multimap`.

Unordered associative containers conform to the requirements for Containers (22.2), except that the expressions `a == b` and `a != b` have different semantics than for the other container types.

Each unordered associative container is parameterized by `Key`, by a function object type `Hash` that meets the `Cpp17Hash` requirements (16.5.3.4) and acts as a hash function for argument values of type `Key`, and by a binary predicate `Pred` that induces an equivalence relation on values of type `Key`. Additionally, `unordered_map` and `unordered_multimap` associate an arbitrary `mapped` type `T` with the `Key`.

The container’s object of type `Hash` — denoted by `hash` — is called the `hash function` of the container. The container’s object of type `Pred` — denoted by `pred` — is called the `key equality predicate` of the container.

Two values `k1` and `k2` are considered equivalent if the container’s key equality predicate `pred(k1, k2)` is valid and returns `true` when passed those values. If `k1` and `k2` are equivalent, the container’s hash function shall return the same value for both. [Note: Thus, when an unordered associative container is instantiated with a non-default `Pred` parameter it usually needs a non-default `Hash` parameter as well. — end note] For any two keys `k1` and `k2` in the same container, calling `pred(k1, k2)` shall always return the same value. For any key `k` in a container, calling `hash(k)` shall always return the same value.

An unordered associative container supports `unique keys` if it may contain at most one element for each key. Otherwise, it supports `equivalent keys`. `unordered_set` and `unordered_map` support unique keys. `unordered_multiset` and `unordered_multimap` support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into `equivalent-key groups` such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.

For `unordered_set` and `unordered_multiset` the value type is the same as the key type. For `unordered_map` and `unordered_multimap` it is `pair<Const Key, T>`.

For unordered containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same.
The elements of an unordered associative container are organized into *buckets*. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For *unordered_multiset* and *unordered_multimap*, rehashing preserves the relative ordering of equivalent elements.

The unordered associative containers meet all the requirements of Allocator-aware containers (22.2.1), except that for *unordered_map* and *unordered_multimap*, the requirements placed on *value_type* in Table 76 apply instead to *key_type* and *mapped_type*. [Note: For example, *key_type* and *mapped_type* are sometimes required to be *Cpp17CopyAssignable* even though the associated *value_type*, *pair<const key_type, mapped_type>* is not *Cpp17CopyAssignable*. — end note]

In Table 81:

- X denotes an unordered associative container class,
- a denotes a value of type X,
- a2 denotes a value of a type with nodes compatible with type X (Table 79),
- b denotes a possibly const value of type X,
- a_uniq denotes a value of type X when X supports unique keys,
- a_eq denotes a value of type X when X supports equivalent keys,
- a_tran denotes a possibly const value of type X when the qualified-ids X::key_equal::is_transparent and X::hasher::is_transparent are both valid and denote types (13.10.2),
- i and j denote input iterators that refer to *value_type*,
- [i, j) denotes a valid range,
- p and q2 denote valid constant iterators to a,
- q and q1 denote valid dereferenceable constant iterators to a,
- r denotes a valid dereferenceable iterator to a,
- [q1, q2) denotes a valid range in a,
- il denotes a value of type *initializer_list*<*value_type>*,
- t denotes a value of type X::value_type,
- k denotes a value of type *key_type*,
- hf denotes a possibly const value of type *hasher*,
- eq denotes a possibly const value of type *key_equal*,
- ke is a value such that
  - (eq(r1, ke) == eq(ke, r1))
  - (eq(r1) == hf(ke) if eq(r1, ke) is true, and
  - (eq(r1, ke) && eq(r1, r2)) == eq(r2, ke)
  where r1 and r2 are keys of elements in a_tran,
- n denotes a value of type *size_type*,
- z denotes a value of type float, and
- nh denotes a non-const rvalue of type X::node_type.

12 Two unordered containers a and b compare equal if a.size() == b.size() and, for every equivalent-key group [Ea1, Ea2) obtained from a.equal_range(Ea1), there exists an equivalent-key group [Eb1, Eb2) obtained from b.equal_range(Ea1), such that is_permutation(Ea1, Ea2, Eb1, Eb2) returns true. For unordered_set and unordered_map, the complexity of operator== (i.e., the number of calls to the == operator of the value_type, to the predicate returned by key_eq(), and to the hasher returned by hash_function()) is proportional to N in the average case and to N^2 in the worst case, where N is a.size(). For unordered_multiset and unordered_multimap, the complexity of operator== is proportional to \( \sum E_i^2 \) in the average case and to \( N^2 \) in the worst case, where N is a.size(), and \( E_i \) is the size of the i-th equivalent-key group in a. However, if the respective elements of each corresponding pair of equivalent-key groups Ea_i and Eb_i are arranged in the same order (as is commonly the case, e.g., if a and b are unmodified copies of the same container), then the average-case complexity for unordered_multiset and unordered_multimap becomes proportional to N (but worst-case complexity remains \( \Theta(N^2) \), e.g., for a pathologically bad hash function). The behavior of a program that uses operator== or operator!= on unordered containers is undefined unless
the `Pred` function object has the same behavior for both containers and the equality comparison function for `Key` is a refinement\(^{224}\) of the partition into equivalent-key groups produced by `Pred`.

13 The iterator types `iterator` and `const_iterator` of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the key type and value type are the same, both `iterator` and `const_iterator` are constant iterators.

14 The `insert` and `emplace` members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The `erase` members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.

15 The `insert` and `emplace` members shall not affect the validity of iterators if 
\[ (N+n) \leq z \times B \]
where \(N\) is the number of elements in the container prior to the insert operation, \(n\) is the number of elements inserted, \(B\) is the container’s bucket count, and \(z\) is the container’s maximum load factor.

16 The `extract` members invalidate only iterators to the removed element, and preserve the relative order of the elements that are not erased; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a `node_type` is undefined behavior. References and pointers to an element obtained while it is owned by a `node_type` are invalidated if the element is successfully inserted.

17 The member function templates `find`, `count`, `equal_range`, and `contains` shall not participate in overload resolution unless the `qualified-ids` `Pred::is_transparent` and `Hash::is_transparent` are both valid and denote types (13.10.2).

18 A deduction guide for an unordered associative container shall not participate in overload resolution if any of the following are true:

\[(18.1)\]  
— It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

\[(18.2)\]  
— It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

\[(18.3)\]  
— It has a `Hash` template parameter and an integral type or a type that qualifies as an allocator is deduced for that parameter.

\[(18.4)\]  
— It has a `Pred` template parameter and a type that qualifies as an allocator is deduced for that parameter.

22.2.7.1 Exception safety guarantees

1 For unordered associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container’s `Hash` or `Pred` object (if any).

2 For unordered associative containers, if an exception is thrown by any operation other than the container’s hash function from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.

3 For unordered associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container’s `Hash` or `Pred` object (if any).

4 For unordered associative containers, if an exception is thrown from within a `rehash()` function other than by the container’s hash function or comparison function, the `rehash()` function has no effect.

22.3 Sequence containers

22.3.1 In general

1 The headers `<array>` (22.3.2), `<deque>` (22.3.3), `<forward_list>` (22.3.4), `<list>` (22.3.5), and `<vector>` (22.3.6) define class templates that meet the requirements for sequence containers.

2 The following exposition-only alias template may appear in deduction guides for sequence containers:

```cpp
#include <compare>  // see 17.11.1
#include <initializer_list>  // see 17.10.1
```

224) Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.
namespace std {
    // 22.3.7, class template array
template<class T, size_t N> struct array;

template<class T, size_t N>
    constexpr bool operator==(const array<T, N>& x, const array<T, N>& y);

// 22.3.7.4, specialized algorithms
template<class T, size_t N>
    constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));

// 22.3.7.6, array creation functions
template<class T, size_t N>
    constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);

// 22.3.7.7, tuple interface

22.3.7 Class template array

22.3.7.1 Overview

1 The header <array> defines a class template for storing fixed-size sequences of objects. An array is a contiguous container (22.2.1). An instance of array<T, N> stores N elements of type T, so that size() == N is an invariant.

2 An array is an aggregate (9.4.1) that can be list-initialized with up to N elements whose types are convertible to T.

3 An array meets all of the requirements of a container and of a reversible container (22.2), except that a default constructed array object is not empty and that swap does not have constant complexity. An array meets some of the requirements of a sequence container (22.2.3). Descriptions are provided here only for operations on array that are not described in one of these tables and for operations where there is additional semantic information.

4 array<T, N> is a structural type (13.2) if T is a structural type. Two values a1 and a2 of type array<T, N> are template-argument-equivalent (13.6) if and only if each pair of corresponding elements in a1 and a2 are template-argument-equivalent.

5 The types iterator and const_iterator meet the constexpr iterator requirements (23.3.1).
namespace std {
    template<class T, size_t N>
    struct array {
        // types
        using value_type = T;
        using pointer = T*;
        using const_pointer = const T*;
        using reference = T&;
        using const_reference = const T&;
        using size_type = size_t;
        using difference_type = ptrdiff_t;
        using iterator = implementation-defined;
        using const_iterator = implementation-defined;
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;
        // no explicit construct/copy/destroy for aggregate type
        constexpr void fill(const T& u);
        constexpr void swap(array&) noexcept(is_nothrow_swappable_v<T>);
        // iterators
        constexpr iterator begin() noexcept;
        constexpr const_iterator begin() const noexcept;
        constexpr iterator end() noexcept;
        constexpr const_iterator end() const noexcept;
        constexpr reverse_iterator rbegin() noexcept;
        constexpr const_reverse_iterator rbegin() const noexcept;
        constexpr reverse_iterator rend() noexcept;
        constexpr const_reverse_iterator rend() const noexcept;
        constexpr const_iterator cbegin() const noexcept;
        constexpr const_iterator cend() const noexcept;
        constexpr const_reverse_iterator crbegin() const noexcept;
        constexpr const_reverse_iterator crend() const noexcept;
        // capacity
        [[nodiscard]] constexpr bool empty() const noexcept;
        constexpr size_type size() const noexcept;
        constexpr size_type max_size() const noexcept;
        // element access
        constexpr reference [](size_type n);
        constexpr const_reference [](size_type n) const;
        constexpr reference at(size_type n);
        constexpr const_reference at(size_type n) const;
        constexpr reference front();
        constexpr const_reference front() const;
        constexpr reference back();
        constexpr const_reference back() const;
        constexpr T * data() noexcept;
        constexpr const T * data() const noexcept;
    };
    template<class T, class... U>
    array(T, U...) -> array<T, 1 + sizeof...(U)>;
};

22.3.7.2 Constructors, copy, and assignment

1 The conditions for an aggregate (9.4.1) shall be met. Class array relies on the implicitly-declared special
member functions (11.4.4.1, 11.4.6, and 11.4.4.2) to conform to the container requirements table in 22.2. In
addition to the requirements specified in the container requirements table, the implicit move constructor and move assignment operator for `array` require that `T` be `Cpp17MoveConstructible` or `Cpp17MoveAssignable`, respectively.

```
template<class T, class... U>
array(T, U...) -> array<T, 1 + sizeof...(U)>;
```

*Mandates: (is_same_v<T, U> && ...) is true.*

### 22.3.7.3 Member functions

```
constexpr size_type size() const noexcept;
```

*Returns: `N`.*

```
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

*Returns: A pointer such that `[data(), data() + size()]` is a valid range. For a non-empty array, `data()` == `addressof(front())`.*

```
constexpr void fill(const T& u);
```

*Effects: As if by `fill_n(begin(), N, u)`.*

```
constexpr void swap(array& y) noexcept(is_nothrow_swappable_v<T>);
```

*Effects: Equivalent to `swap_ranges(begin(), end(), y.begin())`.*

*[Note: Unlike the `swap` function for other containers, `array::swap` takes linear time, may exit via an exception, and does not cause iterators to become associated with the other container. — end note]*

### 22.3.7.4 Specialized algorithms

```
template<class T, size_t N>
constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));
```

*Constraints: `N == 0` or `is_swappable_v<T>` is true.*

*Effects: As if by `x.swap(y)`.*

*Complexity: Linear in `N`.*

### 22.3.7.5 Zero-sized arrays

`array` shall provide support for the special case `N == 0`.

*In the case that `N == 0`, `begin()` == `end()` == unique value. The return value of `data()` is unspecified.*

*The effect of calling `front()` or `back()` for a zero-sized array is undefined.*

*Member function `swap()` shall have a non-throwing exception specification.*

### 22.3.7.6 Array creation functions

```
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
```

*Mandates: `is_array_v<T>` is false and `is_constructible_v<T, T&>` is true.*

*Preconditions: `T` meets the `Cpp17CopyConstructible` requirements.*

*Returns: `{{ a[0], ..., a[N - 1] }}`.*

```
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);
```

*Mandates: `is_array_v<T>` is false and `is_move_constructible_v<T>` is true.*

*Preconditions: `T` meets the `Cpp17MoveConstructible` requirements.*

*Returns: `{{ std::move(a[0]), ..., std::move(a[N - 1]) }}`.*
22.3.7.7 Tuple interface

```cpp
template<class T, size_t N>
struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };
```

```cpp
template<size_t I, class T, size_t N>
struct tuple_element<I, array<T, N>> {
  using type = T;
};
```

1. **Mandates:** I < N is true.

```cpp
template<size_t I, class T, size_t N>
constexpr T& get(array<T, N>& a) noexcept;
```

2. **Mandates:** I < N is true.

```cpp
template<size_t I, class T, size_t N>
constexpr T&& get(array<T, N>&& a) noexcept;
```

3. **Returns:** A reference to the I\textsuperscript{th} element of a, where indexing is zero-based.

### 22.3.8 Class template deque

#### 22.3.8.1 Overview

A deque is a sequence container that supports random access iterators (23.3.5.6). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a deque is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.

A deque meets all of the requirements of a container, of a reversible container (given in tables in 22.2), of a sequence container, including the optional sequence container requirements (22.2.3), and of an allocator-aware container (Table 76). Descriptions are provided here only for operations on deque that are not described in one of these tables or for operations where there is additional semantic information.

```cpp
namespace std {
  template<class T, class Allocator = allocator<T>>
  class deque {
    public:
      // types
      using value_type = T;
      using allocator_type = Allocator;
      using pointer = typename allocator_traits<Allocator>::pointer;
      using const_pointer = typename allocator_traits<Allocator>::const_pointer;
      using reference = value_type&;
      using const_reference = const value_type&;
      using size_type = implementation-defined; // see 22.2
      using difference_type = implementation-defined; // see 22.2
      using iterator = implementation-defined; // see 22.2
      using const_iterator = implementation-defined; // see 22.2
      using reverse_iterator = std::reverse_iterator<iterator>;
      using const_reverse_iterator = std::reverse_iterator<const_iterator>;
    }
    // 22.3.8.2, construct/copy/destroy
    deque() : deque(Allocator()) { }
    explicit deque(const Allocator&) { }
    explicit deque(size_type n, const Allocator&) = Allocator());
    deque(size_type n, const T& value, const Allocator& = Allocator());
    template<class InputIterator>
    deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
    deque(const deque& x);
    deque(deque&&);
    deque(const deque& = Allocator());
    deque(deque&&, const Allocator&);
  }
```
deque(initializer_list<T>, const Allocator& = Allocator());

-deque();
deque& operator=(const deque& x);
deque& operator=(deque&& x)
    noexcept(allocator_traits<Allocator>::is_always_equal::value);
deque& operator=(initializer_list<T>);
template<class InputIterator>
    void assign(InputIterator first, InputIterator last);
    void assign(size_type n, const T& t);
    void assign(initializer_list<T>);
 allocator_type get_allocator() const noexcept;

// iterators
iterator    begin() const noexcept;
const_iterator begin() const noexcept;
iterator    end() const noexcept;
const_iterator end() const noexcept;
reverse_iterator rbegin() const noexcept;
reverse_iterator rend() const noexcept;
const_iterator cbegin() const noexcept;
const_iterator cend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// 22.3.8.3, capacity
[[nodiscard]] bool empty() const noexcept;
size_type size() const noexcept;
size_type max_size() const noexcept;
    void resize(size_type sz);
    void resize(size_type sz, const T& c);
    void shrink_to_fit();

// element access
reference    operator[](size_type n);
const_reference operator[](size_type n) const;
reference    at(size_type n);
const_reference at(size_type n) const;
reference    front();
const_reference front() const;
reference    back();
const_reference back() const;

// 22.3.8.4, modifiers
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);

void push_front(const T& x);
void push_back(T&& x);

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert(const_iterator position, InputIterator first, InputIterator last);
    iterator insert(const_iterator position, initializer_list<T>);

§ 22.3.8.1 ©ISO/IEC 2020 – All rights reserved 825
void pop_front();
void pop_back();

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void swap(deque&)
     noexcept(allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;
};

template<class InputIterator, class Allocator = allocator<
     iter_value_type<InputIterator>>>(
    deque(InputIterator, InputIterator, Allocator = Allocator());

    // swap
    template<class T, class Allocator>
    void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
     noexcept(noexcept(x.swap(y)));
}

22.3.8.2 Constructors, copy, and assignment
[deque.cons]
explicit deque(const Allocator&);
1     Effects: Constructs an empty deque, using the specified allocator.
2     Complexity: Constant.

explicit deque(size_type n, const Allocator& = Allocator());
3     Effects: Constructs a deque with n default-inserted elements using the specified allocator.
4     Preconditions: T is Cpp17DefaultInsertable into *this.
5     Complexity: Linear in n.

deque(size_type n, const T& value, const Allocator& = Allocator());
6     Effects: Constructs a deque with n copies of value, using the specified allocator.
7     Preconditions: T is Cpp17CopyInsertable into *this.
8     Complexity: Linear in n.

template<class InputIterator>
    deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
9     Effects: Constructs a deque equal to the range [first, last), using the specified allocator.
10    Complexity: Linear in distance(first, last).

22.3.8.3 Capacity
[deque.capacity]
void resize(size_type sz);
1     Preconditions: T is Cpp17MoveInsertable and Cpp17DefaultInsertable into *this.
2     Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.

void resize(size_type sz, const T& c);
3     Preconditions: T is Cpp17CopyInsertable into *this.
4     Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.

void shrink_to_fit();
5     Preconditions: T is Cpp17MoveInsertable into *this.
6     Effects: shrink_to_fit is a non-binding request to reduce memory use but does not change the size of the sequence. [Note: The request is non-binding to allow latitude for implementation-specific
optimizations. —end note] If the size is equal to the old capacity, or if an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T, then there are no effects.

7 Complexity: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

8 Remarks: If the size is not equal to the old capacity, then invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

22.3.8.4 Modifiers

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);

1 Effects: An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.

2 Remarks: If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-Cpp17CopyInsertable T, the effects are unspecified.

3 Complexity: The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element at either the beginning or end of a deque always takes constant time and causes a single call to a constructor of T.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();

4 Effects: An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque.

[Note: pop_front and pop_back are erase operations. —end note]

5 Complexity: The number of calls to the destructor of T is the same as the number of elements erased, but the number of calls to the assignment operator of T is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.

6 Throws: Nothing unless an exception is thrown by the assignment operator of T.

22.3.8.5 Erasure

template<class T, class Allocator, class U>
typename deque<T, Allocator>::size_type
erase(deque<T, Allocator>& c, const U& value);

1 Effects: Equivalent to:
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
template<class T, class Allocator, class Predicate>
typename deque<T, Allocator>::size_type
erase_if(deque<T, Allocator>& c, Predicate pred);

Effects: Equivalent to:
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

22.3.9 Class template forward_list

22.3.9.1 Overview

A forward_list is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported. [Note: It is intended that forward_list have zero space or time overhead relative to a hand-written C-style singly linked list. Features that would conflict with that goal have been omitted. — end note]

A forward_list meets all of the requirements of a container (Table 73), except that the size() member function is not provided and operator== has linear complexity. A forward_list also meets all of the requirements for an allocator-aware container (Table 76). In addition, a forward_list provides the assign member functions (Table 77) and several of the optional container requirements (Table 78). Descriptions are provided here only for operations on forward_list that are not described in that table or for operations where there is additional semantic information.

3 [Note: Modifying any list requires access to the element preceding the first element of interest, but in a forward_list there is no constant-time way to access a preceding element. For this reason, ranges that are modified, such as those supplied to erase and splice, must be open at the beginning. — end note]
template<class InputIterator>
    void assign(InputIterator first, InputIterator last);
void assign(size_type n, const T& t);
void assign(initializer_list<T>);
allocator_type get_allocator() const noexcept;

// 22.3.9.3, iterators
iterator before_begin() noexcept;
const_iterator before_begin() const noexcept;
iterator begin() noexcept;
const_iterator begin() const noexcept;
iterator end() noexcept;
const_iterator end() const noexcept;

const_iterator cbegin() const noexcept;
const_iterator cbefore_begin() const noexcept;
const_iterator cend() const noexcept;

// capacity
[[nodiscard]] bool empty() const noexcept;
size_type max_size() const noexcept;

// 22.3.9.4, element access
reference front();
const_reference front() const;

// 22.3.9.5, modifiers
template<class... Args> reference emplace_front(Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void pop_front();
template<class... Args> iterator emplace_after(const_iterator position, Args&&... args);
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);
iterator insert_after(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
iterator insert_after(const_iterator position, initializer_list<T> il);

iterator erase_after(const_iterator position);
iterator erase_after(const_iterator position, const_iterator last);
void swap(forward_list&);
    noexcept(allocator_traits<Allocator>::is_always_equal::value);

void resize(size_type sz);
void resize(size_type sz, const value_type& c);
void clear() noexcept;

// 22.3.9.6, forward_list operations
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);
void splice_after(const_iterator position, forward_list& x,
    const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
    const_iterator first, const_iterator last);

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);

void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);

void sort();
template<class Compare> void sort(Compare comp);

void reverse() noexcept;

};

}

4 An incomplete type T may be used when instantiating forward_list if the allocator meets the allocator completeness requirements (16.5.3.5.1). T shall be complete before any member of the resulting specialization of forward_list is referenced.

22.3.9.2 Constructors, copy, and assignment

explicit forward_list(const Allocator&);

Effects: Constructs an empty forward_list object using the specified allocator.
Complexity: Constant.

explicit forward_list(size_type n, const Allocator& = Allocator());

Preconditions: T is Cpp17DefaultInsertable into *this.
Effects: Constructs a forward_list object with n default-inserted elements using the specified allocator.
Complexity: Linear in n.

forward_list(size_type n, const T& value, const Allocator& = Allocator());

Preconditions: T is Cpp17CopyInsertable into *this.
Effects: Constructs a forward_list object with n copies of value using the specified allocator.
Complexity: Linear in n.

template<class InputIterator>
forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());

Effects: Constructs a forward_list object equal to the range [first, last).
Complexity: Linear in distance(first, last).

22.3.9.3 Iterators

iterator before_begin() noexcept;
const_iterator before_begin() const noexcept;
const_iterator cbefore_begin() const noexcept;

Returns: A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by begin().
Effects: cbefore_begin() is equivalent to const_cast<forward_list const&>(*this).before_begin().
Remarks: before_begin() == end() shall equal false.
22.3.9.4 Element access

reference front();
const_reference front() const;

Returns: *begin()

22.3.9.5 Modifiers

None of the overloads of insert_after shall affect the validity of iterators and references, and erase_after shall invalidate only iterators and references to the erased elements. If an exception is thrown during insert_after there shall be no effect. Inserting n elements into a forward_list is linear in n, and the number of calls to the copy or move constructor of T is exactly equal to n. Erasing n elements from a forward_list is linear in n and the number of calls to the destructor of type T is exactly equal to n.

template<class... Args> reference emplace_front(Args&&... args);

Effects: Inserts an object of type value_type constructed with value_type(std::forward<Args>(args)...) at the beginning of the list.

void push_front(const T& x);
void push_front(T&& x);

Effects: Inserts a copy of x at the beginning of the list.

void pop_front();

Effects: As if by erase_after(before_begin()).

iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);

Preconditions: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).

Effects: Inserts a copy of x after position.

Returns: An iterator pointing to the copy of x.

iterator insert_after(const_iterator position, size_type n, const T& x);

Preconditions: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).

Effects: Inserts n copies of x after position.

Returns: An iterator pointing to the last inserted copy of x or position if n == 0.

template<class InputIterator>
iterator insert_after(const_iterator position, InputIterator first, InputIterator last);

Preconditions: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()). Neither first nor last are iterators in *this.

Effects: Inserts copies of elements in [first, last) after position.

Returns: An iterator pointing to the last inserted element or position if first == last.

iterator insert_after(const_iterator position, initializer_list<T> il);

Effects: insert_after(p, il.begin(), il.end()).

Returns: An iterator pointing to the last inserted element or position if il is empty.

template<class... Args>
iterator emplace_after(const_iterator position, Args&&... args);

Preconditions: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).

Effects: Inserts an object of type value_type constructed with value_type(std::forward<Args>(args)...) after position.

Returns: An iterator pointing to the new object.
iterator erase_after(const_iterator position);  
  
  **Preconditions:** The iterator following `position` is dereferenceable.
  
  **Effects:** Erases the element pointed to by the iterator following `position`.
  
  **Returns:** An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.
  
  **Throws:** Nothing.

**iterator erase_after(const_iterator position, const_iterator last);**

  **Preconditions:** All iterators in the range `(position, last)` are dereferenceable.
  
  **Effects:** Erases the elements in the range `(position, last)`.
  
  **Returns:** `last`.
  
  **Throws:** Nothing.

```cpp
void resize(size_type sz);
```

  **Preconditions:** `T` is `Cpp17DefaultInsertable` into `*this`.
  
  **Effects:** If `sz < distance(begin(), end())`, erases the last `distance(begin(), end()) - sz` elements from the list. Otherwise, inserts `sz - distance(begin(), end())` default-inserted elements at the end of the list.

```cpp
void resize(size_type sz, const value_type& c);
```

  **Preconditions:** `T` is `Cpp17CopyInsertable` into `*this`.
  
  **Effects:** If `sz < distance(begin(), end())`, erases the last `distance(begin(), end()) - sz` elements from the list. Otherwise, inserts `sz - distance(begin(), end())` copies of `c` at the end of the list.

```cpp
void clear() noexcept;
```

  **Effects:** Erases all elements in the range `[begin(), end())`.
  
  **Remarks:** Does not invalidate past-the-end iterators.

### 22.3.9.6 Operations

In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall meet the corresponding requirements in 25.2. For `merge` and `sort`, the definitions and requirements in 25.8 apply.

```cpp
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);
```

  **Preconditions:** `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. `get_allocator()` == `x.get_allocator()` is true. `addressof(x) != this` is true.
  
  **Effects:** Inserts the contents of `x` after `position`, and `x` becomes empty. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.
  
  **Throws:** Nothing.
  
  **Complexity:** $O(distance(x.begin(), x.end()))$

```cpp
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);
```

  **Preconditions:** `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. The iterator following `i` is a dereferenceable iterator in `x`. `get_allocator()` == `x.get_allocator()` is true.
  
  **Effects:** Inserts the element following `i` into `*this`, following `position`, and removes it from `x`. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `***i` continue to refer to the same element but as a member of `*this`. Iterators to `***i` continue to refer to the same element, but now behave as iterators into `*this`, not into `x`.

§ 22.3.9.6 ©ISO/IEC 2020 – All rights reserved 832
8  Throws: Nothing.

9  Complexity: $\Theta(1)$

void splice_after(const_iterator position, forward_list& x,
const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
const_iterator first, const_iterator last);

10  Preconditions: position is before_begin() or is a dereferenceable iterator in the range [begin(),
end()). (first, last) is a valid range in x, and all iterators in the range (first, last) are
dereferenceable. position is not an iterator in the range (first, last). get_allocator() ==
x.get_allocator() is true.

11  Effects: Inserts elements in the range (first, last) after position and removes the elements from x.
Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they
now behave as iterators into *this, not into x.

12  Complexity: $\Theta(\text{distance(first, last)})$

13  size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

14  Effects: Erases all the elements in the list referred to by a list iterator i for which the following
conditions hold: \$i == value\$ (for remove()), \$\text{pred}(\text{i})\$ is true (for remove_if()). Invalidates only
the iterators and references to the erased elements.

15  Returns: The number of elements erased.

16  Throws: Nothing unless an exception is thrown by the equality comparison or the predicate.

17  Remarks: Stable (16.5.5.8).

18  Complexity: Exactly distance(begin(), end()) applications of the corresponding predicate.

19  size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate pred);

20  Effects: Erases all but the first element from every consecutive group of equal elements referred to
by the iterator i in the range [first + 1, last) for which \$i == *(i-1)\$ (for the version with no
arguments) or \$\text{pred}(\text{i}, *(i - 1))\$ (for the version with a predicate argument) holds. Invalidates
only the iterators and references to the erased elements.

21  Returns: The number of elements erased.

22  Throws: Nothing unless an exception is thrown by the equality comparison or the predicate.

23  Complexity: If the range [first, last) is not empty, exactly (last - first) - 1 applications of
the corresponding predicate, otherwise no applications of the predicate.

24  void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);

25  Preconditions: *this and x are both sorted with respect to the comparator operator< (for the first
two overloads) or comp (for the last two overloads), and get_allocator() == x.get_allocator() is
true.

26  Effects: Merges the two sorted ranges [begin(), end()) and [x.begin(), x.end()). x is empty
after the merge. If an exception is thrown other than by a comparison there are no effects. Pointers
and references to the moved elements of x now refer to those same elements but as members of *this.
Iterators referring to the moved elements will continue to refer to their elements, but they now behave
as iterators into *this, not into x.

27  Remarks: Stable (16.5.5.8).

28  Complexity: At most distance(begin(), end()) + distance(x.begin(), x.end()) - 1 comparisons.
void sort();
template<class Compare> void sort(Compare comp);

Effects: Sorts the list according to the `operator<` or the `comp` function object. If an exception is thrown, the order of the elements in `this` is unspecified. Does not affect the validity of iterators and references.
Remarks: Stable (16.5.5.8).
Complexity: Approximately $N \log N$ comparisons, where $N$ is `distance(begin(), end())`.

void reverse() noexcept;

Effects: Reverses the order of the elements in the list. Does not affect the validity of iterators and references.
Complexity: Linear time.

22.3.9.7 Erasure

```cpp
template<class T, class Allocator, class U>
typename forward_list<T, Allocator>::size_type
erase(forward_list<T, Allocator>& c, const U& value);
```

Effects: Equivalent to: return erase_if(c, [&](auto& elem) { return elem == value; });

```cpp
template<class T, class Allocator, class Predicate>
typename forward_list<T, Allocator>::size_type
erase_if(forward_list<T, Allocator>& c, Predicate pred);
```

Effects: Equivalent to: return c.remove_if(pred);

22.3.10 Class template list

22.3.10.1 Overview

A `list` is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (22.3.11) and deques (22.3.8), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.

A `list` meets all of the requirements of a container, of a reversible container (given in two tables in 22.2), of a sequence container, including most of the optional sequence container requirements (22.2.3), and of an allocator-aware container (Table 76). The exceptions are the `operator[]` and `at` member functions, which are not provided. Descriptions are provided here only for operations on `list` that are not described in one of these tables or for operations where there is additional semantic information.

```cpp
namespace std {
    template<class T, class Allocator = allocator<T>>
    class list {
    public:
        // types
        using value_type = T;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using size_type = implementation-defined; // see 22.2
        using difference_type = implementation-defined; // see 22.2
        using iterator = std::reverse_iterator<iterator>;
        using const_iterator = std::reverse_iterator<const_iterator>;

        // 22.3.10.2, construct/copy/destroy
        list() : list(Allocator()) {} //
        explicit list(const Allocator&);
    }
}
```

225) These member functions are only provided by containers whose iterators are random access iterators.
explicit list(size_type n, const Allocator& = Allocator());
list(size_type n, const T& value, const Allocator& = Allocator());
template<class InputIterator>
  list(InputIterator first, InputIterator last, const Allocator& = Allocator());
list(const list& x);
list(list&& x);
list(const list&, const Allocator&);
list(list&&, const Allocator&);
list(initializer_list<T>, const Allocator& = Allocator());
~list();
list& operator=(const list& x);
list& operator=(list&& x) noexcept(allocator_traits<Allocator>::is_always_equal::value);
list& operator=(initializer_list<T>);
template<class InputIterator>
  void assign(InputIterator first, InputIterator last);
void assign(size_type n, const T& t);
void assign(initializer_list<T>);
allocator_type get_allocator() const noexcept;

// iterators
iterator begin() noexcept;
const_iterator begin() const noexcept;
iterator end() noexcept;
const_iterator end() const noexcept;
reverse_iterator rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
reverse_iterator rend() noexcept;
const_reverse_iterator rend() const noexcept;
const_iterator cbegin() const noexcept;
const_iterator cend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// 22.3.10.3, capacity
[[nodiscard]] bool empty() const noexcept;
size_type size() const noexcept;
size_type max_size() const noexcept;
void resize(size_type sz);
void resize(size_type sz, const T& c);

// element access
reference front();
const_reference front() const;
reference back();
const_reference back() const;

// 22.3.10.4, modifiers
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void pop_front();
void push_back(const T& x);
void push_back(T&& x);
void pop_back();

template<class... Args> iterator emplace(const_iterator position, Args&&... args);
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T> il);
iterator erase(const_iterator position);
iterator erase(const_iterator position, const_iterator last);
void swap(list&) noexcept(allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;

// 22.3.10.5, list operations
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);
void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);
void splice(const_iterator position, list& x, const_iterator first, const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first, const_iterator last);

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

size_type unique();
template<class BinaryPredicate>
  size_type unique(BinaryPredicate binary_pred);

void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);

void sort();
template<class Compare> void sort(Compare comp);
void reverse() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>> list(InputIterator, InputIterator, Allocator = Allocator())
  -> list<iter-value-type<InputIterator>, Allocator>;

// swap
  template<class T, class Allocator>
    void swap(list<T, Allocator>& x, list<T, Allocator>& y)
      noexcept(x.swap(y));

3 An incomplete type T may be used when instantiating list if the allocator meets the allocator completeness requirements (16.5.3.5.1). T shall be complete before any member of the resulting specialization of list is referenced.

22.3.10.2 Constructors, copy, and assignment
explicit list(const Allocator&);
1  Effects: Constructs an empty list, using the specified allocator.
2  Complexity: Constant.

explicit list(size_type n, const Allocator& = Allocator());
3  Preconditions: T is Cpp17DefaultInsertable into *this.
4  Effects: Constructs a list with n default-inserted elements using the specified allocator.
5  Complexity: Linear in n.

list(size_type n, const T& value, const Allocator& = Allocator());
6  Preconditions: T is Cpp17CopyInsertable into *this.
7  Effects: Constructs a list with n copies of value, using the specified allocator.
template<class InputIterator>
list(InputIterator first, InputIterator last, const Allocator& = Allocator());

Effects: Constructs a list equal to the range [first, last).

Complexity: Linear in distance(first, last).

22.3.10.3 Capacity

void resize(size_type sz);

Preconditions: T is Cpp17DefaultInsertable into *this.

Effects: If size() < sz, appends sz - size() default-inserted elements to the sequence. If sz <= size(), equivalent to:

list<T>::iterator it = begin();
advance(it, sz);
erase(it, end());

void resize(size_type sz, const T& c);

Preconditions: T is Cpp17CopyInsertable into *this.

Effects: As if by:

if (sz > size())
  insert(end(), sz-size(), c);
else if (sz < size()) {
  iterator i = begin();
  advance(i, sz);
  erase(i, end());
} else
  // do nothing

22.3.10.4 Modifiers

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T>);
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);

Remarks: Does not affect the validity of iterators and references. If an exception is thrown there are no effects.

Complexity: Insertion of a single element into a list takes constant time and exactly one call to a constructor of T. Insertion of multiple elements into a list is linear in the number of elements inserted, and the number of calls to the copy constructor or move constructor of T is exactly equal to the number of elements inserted.
void clear() noexcept;

Effects: Invalidates only the iterators and references to the erased elements.

Throws: Nothing.

Complexity: Erasing a single element is a constant time operation with a single call to the destructor of T. Erasing a range in a list is linear time in the size of the range and the number of calls to the destructor of type T is exactly equal to the size of the range.

### 22.3.10.5 Operations

Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically for them. In this subclause, arguments for a template parameter named Predicate or BinaryPredicate shall meet the corresponding requirements in 25.2. For merge and sort, the definitions and requirements in 25.8 apply.

list provides three splice operations that destructively move elements from one list to another. The behavior of splice operations is undefined if get_allocator() != x.get_allocator().

```cpp
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);
```

Preconditions: addressof(x) != this is true.

Effects: Inserts the contents of x before position and x becomes empty. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: Constant time.

```cpp
void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);
```

Preconditions: i is a valid dereferenceable iterator of x.

Effects: Inserts an element pointed to by i from list x before position and removes the element from x. The result is unchanged if position == i or position == ++i. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators to *i continue to refer to this same element but as members of *this. Iterators to *i (including i itself) continue to refer to the same element, but now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: Constant time.

```cpp
void splice(const_iterator position, list& x, const_iterator first, const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first, const_iterator last);
```

Preconditions: [first, last) is a valid range in x. position is not an iterator in the range [first, last).

Effects: Inserts elements in the range [first, last) before position and removes the elements from x. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: Constant time if addressof(x) == this; otherwise, linear time.

```cpp
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
```

Effects: Erases all the elements in the list referred to by a list iterator i for which the following conditions hold: *i == value, pred(*i) != false. Invalidates only the iterators and references to the erased elements.

(As specified in 16.5.3.5, the requirements in this Clause apply only to lists whose allocators compare equal.)
Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by \(*i == value\) or \(\text{pred}(*i) \neq \text{false}\).

Remarks: Stable (16.5.5.8).

Complexity: Exactly \(\text{size()}\) applications of the corresponding predicate.

```cpp
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);
```

Effects: Erases all but the first element from every consecutive group of equal elements referred to by
the iterator \(i\) in the range \([\text{first} + 1, \text{last})\) for which \(*i == *(i-1)\) (for the version of \textit{unique}
with no arguments) or \(\text{pred}(*i, *(i - 1))\) (for the version of \textit{unique} with a predicate argument) holds.
Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by \(*i == *(i-1)\) or \(\text{pred}(*i, *(i - 1))\).

Complexity: If the range \([\text{first}, \text{last})\) is not empty, exactly \((\text{last} - \text{first}) - 1\) applications of
the corresponding predicate, otherwise no applications of the predicate.

```cpp
void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);
```

Preconditions: Both the list and the argument list shall be sorted with respect to the comparator
\textit{operator<} (for the first two overloads) or \textit{comp} (for the last two overloads), and \textit{get_allocator()} ==
\textit{x.get_allocator()} is true.

Effects: If \textit{addressof(x)} == \textit{this}, does nothing; otherwise, merges the two sorted ranges \([\text{begin()}, \text{end()}\) and \((\text{x.begin()}, \text{x.end()}\). The result is a range in which the elements will be sorted in
non-decreasing order according to the ordering defined by \textit{comp}; that is, for every iterator \(i\), in the
range other than the first, the condition \textit{comp}(*i, *(i - 1)) will be \textit{false}. Pointers and references to
the moved elements of \(x\) now refer to those same elements but as members of \(*this\). Iterators referring
to the moved elements will continue to refer to their elements, but they now behave as iterators into
\(\text{this}\), not into \(x\).

Remarks: Stable (16.5.5.8). If \textit{addressof(x)} != \textit{this}, the range \([\text{x.begin()}, \text{x.end()}\) is empty
after the merge. No elements are copied by this operation.

Complexity: At most \(\text{size()} + \text{x.size()} - 1\) applications of \textit{comp} if \textit{addressof(x)} != \textit{this}; other-
wise, no applications of \textit{comp} are performed. If an exception is thrown other than by a comparison
there are no effects.

```cpp
void reverse() noexcept;
```

Effects: Reverses the order of the elements in the list. Does not affect the validity of iterators and
references.

Complexity: Linear time.

```cpp
void sort();
```

Effects: Sorts the list according to the \textit{operator<} or a \textit{Compare} function object. If an exception is
thrown, the order of the elements in \(*this\) is unspecified. Does not affect the validity of iterators and
references.

Remarks: Stable (16.5.5.8).

Complexity: Approximately \(N \log N\) comparisons, where \(N == \text{size()}\).

22.3.10.6 Erasure

```cpp
template<class T, class Allocator, class U>
typename list<T, Allocator>::size_type
erase(list<T, Allocator>& c, const U& value);
```

Effects: Equivalent to: \textit{return erase_if}(c, [&]{auto& elem \{ return elem == value; }});
template<class T, class Allocator, class Predicate>
typename list<T, Allocator>::size_type
erase_if(list<T, Allocator>& c, Predicate pred);

Effects: Equivalent to: return c.remove_if(pred);

22.3.11 Class template vector

22.3.11.1 Overview

A vector is a sequence container that supports (amortized) constant time insert and erase operations at the
end; insert and erase in the middle take linear time. Storage management is handled automatically, though
hints can be given to improve efficiency.

A vector meets all of the requirements of a container and of a reversible container (given in two tables
in 22.2), of a sequence container, including most of the optional sequence container requirements (22.2.3),
of an allocator-aware container (Table 76), and, for an element type other than bool, of a contiguous
container (22.2.1). The exceptions are the push_front, pop_front, and emplace_front member functions,
which are not provided. Descriptions are provided here only for operations on vector that are not described
in one of these tables or for operations where there is additional semantic information.

3 The types iterator and const_iterator meet the constexpr iterator requirements (23.3.1).

namespace std {
    template<class T, class Allocator = allocator<T>>
    class vector {
    public:
        // types
        using value_type = T;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using size_type = implementation-defined; // see 22.2
        using difference_type = implementation-defined; // see 22.2
        using iterator = implementation-defined; // see 22.2
        using const_iterator = implementation-defined; // see 22.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;

        // 22.3.11.2, construct/copy/destroy
        constexpr vector() noexcept(noexcept(Allocator())) : vector(Allocator()) { }
        constexpr explicit vector(const Allocator&) noexcept;
        constexpr explicit vector(size_type n, const Allocator& = Allocator());
        constexpr vector(size_type n, const T& value, const Allocator& = Allocator());
        template<class InputIterator>
        constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
        constexpr vector(const vector& x);
        constexpr vector(vector&&) noexcept;
        constexpr vector(const vector&, const Allocator&);
        constexpr vector(vector&&, const Allocator&);
        constexpr vector(initializer_list<T>, const Allocator& = Allocator());
        constexpr ~vector();
        constexpr vector& operator=(const vector& x);
        constexpr vector& operator=(vector&& x) noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
            allocator_traits<Allocator>::is_always_equal::value);
        constexpr vector& operator=(initializer_list<T>);
        template<class InputIterator>
        constexpr void assign(InputIterator first, InputIterator last);
        constexpr void assign(size_type n, const T& u);
        constexpr void assign(initializer_list<T>);
        constexpr allocator_type get_allocator() const noexcept;
    }

template<class InputIterator, class Allocator = allocator<iter_value_type<InputIterator>>> vector(InputIterator, InputIterator, Allocator = Allocator())
   -> vector<iter_value_type<InputIterator>, Allocator>;

§ 22.3.11.1 ©ISO/IEC 2020 – All rights reserved 841
// swap
template<class T, class Allocator>
constexpr void swap(vector<T, Allocator>& x, vector<T, Allocator>& y)
   noexcept(noexcept(x.swap(y)));

An incomplete type T may be used when instantiating vector if the allocator meets the allocator completeness requirements (16.5.3.5.1). T shall be complete before any member of the resulting specialization of vector is referenced.

22.3.11.2 Constructors, copy, and assignment

constexpr explicit vector(const Allocator&) noexcept;
   Effects: Constructs an empty vector, using the specified allocator.
   Complexity: Constant.

constexpr explicit vector(size_type n, const Allocator& = Allocator());
   Preconditions: T is Cpp17DefaultInsertable into *this.
   Effects: Constructs a vector with n default-inserted elements using the specified allocator.
   Complexity: Linear in n.

constexpr vector(size_type n, const T& value, const Allocator& = Allocator());
   Preconditions: T is Cpp17CopyInsertable into *this.
   Effects: Constructs a vector with n copies of value, using the specified allocator.
   Complexity: Linear in n.

template<class InputIterator>
constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
   Effects: Constructs a vector equal to the range [first, last), using the specified allocator.
   Complexity: Makes only N calls to the copy constructor of T (where N is the distance between first and last) and no reallocations if iterators first and last are of forward, bidirectional, or random access categories. It makes order N calls to the copy constructor of T and order log N reallocations if they are just input iterators.

22.3.11.3 Capacity

constexpr size_type capacity() const noexcept;
   Returns: The total number of elements that the vector can hold without requiring reallocation.
   Complexity: Constant time.

constexpr void reserve(size_type n);
   Preconditions: T is Cpp17MoveInsertable into *this.
   Effects: A directive that informs a vector of a planned change in size, so that it can manage the storage allocation accordingly. After reserve(), capacity() is greater or equal to the argument of reserve if reallocation happens; and equal to the previous value of capacity() otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of reserve(). If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable type, there are no effects.
   Complexity: It does not change the size of the sequence and takes at most linear time in the size of the sequence.
   Throws: length_error if n > max_size().
   Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator. [Note: If no reallocation happens, they remain valid.

227) reserve() uses Allocator::allocate() which may throw an appropriate exception.
No reallocation shall take place during insertions that happen after a call to `reserve()` until an insertion would make the size of the vector greater than the value of `capacity()`.

```cpp
constexpr void shrink_to_fit();
```

**Preconditions:** `T` is `Cpp17MoveInsertable` into `*this`.

**Effects:** `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`. [Note: The request is non-binding to allow latitude for implementation-specific optimizations. — end note] It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation. If an exception is thrown other than by the move constructor of a non-`Cpp17CopyInsertable` `T` there are no effects.

**Complexity:** If reallocation happens, linear in the size of the sequence.

**Remarks:** Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator. [Note: If no reallocation happens, they remain valid. — end note]

```cpp
constexpr void swap(vector& x) noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value || allocator_traits<Allocator>::is_always_equal::value);
```

**Effects:** Exchanges the contents and `capacity()` of `*this` with that of `x`.

**Complexity:** Constant time.

```cpp
constexpr void resize(size_type sz);
```

**Preconditions:** `T` is `Cpp17MoveInsertable` and `Cpp17DefaultInsertable` into `*this`.

**Effects:** If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` default-inserted elements to the sequence.

**Remarks:** If an exception is thrown other than by the move constructor of a non-`Cpp17CopyInsertable` `T` there are no effects.

```cpp
constexpr void resize(size_type sz, const T& c);
```

**Preconditions:** `T` is `Cpp17CopyInsertable` into `*this`.

**Effects:** If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` copies of `c` to the sequence.

**Remarks:** If an exception is thrown there are no effects.

### 22.3.11.4 Data

```cpp
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

**Returns:** A pointer such that `[data(), data() + size()]` is a valid range. For a non-empty vector, `data() == addressof(front())`.

**Complexity:** Constant time.

### 22.3.11.5 Modifiers

```cpp
constexpr iterator insert(const_iterator position, const T& x);
```  
```cpp
constexpr iterator insert(const_iterator position, T&& x);
```  
```cpp
constexpr iterator insert(const_iterator position, size_type n, const T& x);
```  
```cpp
template<class InputIterator>
constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
```  
```cpp
constexpr iterator insert(const_iterator position, initializer_list<T>);
```  
```cpp
template<class... Args> constexpr reference emplace_back(Args&&... args);
```  
```cpp
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
```  
```cpp
constexpr void push_back(const T& x);
```  
```cpp
constexpr void push_back(T&& x);
```

**Remarks:** Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator. If no reallocation happens, then references, pointers, and iterators before the insertion
point remain valid but those at or after the insertion point, including the past-the-end iterator, are
invalidated. If an exception is thrown other than by the copy constructor, move constructor, assignment
operator, or move assignment operator of T or by any InputIterator operation there are no effects.
If an exception is thrown while inserting a single element at the end and T is Cpp17CopyInsertable
or is_nothrow_move_constructible_v<T> is true, there are no effects. Otherwise, if an exception is
thrown by the move constructor of a non-Cpp17CopyInsertable T, the effects are unspecified.

Complexity: If reallocation happens, linear in the number of elements of the resulting vector; otherwise,
linear in the number of elements inserted plus the distance to the end of the vector.

constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_back();

Effects: Invalidates iterators and references at or after the point of the erase.

Complexity: The destructor of T is called the number of times equal to the number of the elements
erased, but the assignment operator of T is called the number of times equal to the number of elements
in the vector after the erased elements.

Throws: Nothing unless an exception is thrown by the assignment operator or move assignment operator
of T.

22.3.11.6 Erasure [vector.erasure]
template<class T, class Allocator, class U>
constexpr typename vector<T, Allocator>::size_type
erase(vector<T, Allocator>& c, const U& value);

Effects: Equivalent to:
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

template<class T, class Allocator, class Predicate>
constexpr typename vector<T, Allocator>::size_type
erase_if(vector<T, Allocator>& c, Predicate pred);

Effects: Equivalent to:
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

22.3.12 Class vector<bool> [vector.bool]

To optimize space allocation, a specialization of vector for bool elements is provided:

namespace std {
    template<class Allocator>
    class vector<bool, Allocator> {
    public:
        // types
        using value_type = bool;
        using allocator_type = Allocator;
        using pointer = implementation-defined;
        using const_pointer = implementation-defined;
        using const_reference = bool;
        using size_type = implementation-defined; // see 22.2
        using difference_type = implementation-defined; // see 22.2
        using iterator = implementation-defined; // see 22.2
        using const_iterator = implementation-defined; // see 22.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;
    }
class reference {
    friend class vector;
    constexpr reference() noexcept;
public:
    constexpr reference(const reference&) = default;
    constexpr operator bool() const noexcept;
    constexpr reference& operator=(const bool x) noexcept;
    constexpr reference& operator=(const reference& x) noexcept;
    constexpr void flip() noexcept;  // flips the bit
};

constexpr vector() : vector(Allocator()) { }
constexpr explicit vector(const Allocator&);
constexpr explicit vector(size_type n, const Allocator& = Allocator());
constexpr vector(size_type n, const bool& value, const Allocator& = Allocator());
template<class InputIterator>
constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
constexpr vector(const vector& x);
constexpr vector(vector&& x);
constexpr vector(const vector&, const Allocator&);
constexpr vector(vector&&, const Allocator&);
constexpr vector(initializer_list<bool>, const Allocator& = Allocator());
template<class InputIterator>
constexpr void assign(InputIterator first, InputIterator last);
constexpr void assign(size_type n, const bool& t);
constexpr void assign(initializer_list<bool>);
constexpr allocator_type get_allocator() const noexcept;

constexpr iterator begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr iterator end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr reverse_iterator rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_iterator cbegin() const noexcept;
constexpr const_iterator cend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

[[nodiscard]] constexpr bool empty() const noexcept;
constexpr size_type size() const noexcept;
constexpr size_type max_size() const noexcept;
constexpr size_type capacity() const noexcept;
constexpr void resize(size_type sz, bool c = false);
constexpr void reserve(size_type n);
constexpr void shrink_to_fit();

constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr const_reference at(size_type n) const;
constexpr reference at(size_type n);
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

// modifiers
template<class... Args> constexpr reference emplace_back(Args&&... args);
constexpr void push_back(const bool& x);
constexpr void pop_back();
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr iterator insert(const_iterator position, const bool& x);
constexpr iterator insert(const_iterator position, size_type n, const bool& x);
template<class InputIterator>
  constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
  constexpr iterator insert(const_iterator position, initializer_list<bool> il);
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void swap(vector&);
constexpr static void swap(reference x, reference y) noexcept;
constexpr void flip() noexcept;  // flips all bits
constexpr void clear() noexcept;

2 Unless described below, all operations have the same requirements and semantics as the primary vector template, except that operations dealing with the bool value type map to bit values in the container storage and allocator_traits::construct (20.10.9.2) is not used to construct these values.

3 There is no requirement that the data be stored as a contiguous allocation of bool values. A space-optimized representation of bits is recommended instead.

4 reference is a class that simulates the behavior of references of a single bit in vector<bool>. The conversion function returns true when the bit is set, and false otherwise. The assignment operator sets the bit when the argument is (convertible to) true and clears it otherwise. flip reverses the state of the bit.

constexpr void flip() noexcept;
Effects: Replaces each element in the container with its complement.

constexpr static void swap(reference x, reference y) noexcept;
Effects: Exchanges the contents of x and y as if by:

    bool b = x;
    x = y;
    y = b;

template<class Allocator> struct hash<vector<bool, Allocator>>;

7 The specialization is enabled (20.14.18).

22.4 Associative containers

22.4.1 In general

1 The header <map> defines the class templates map and multimap; the header <set> defines the class templates set and multiset.

2 The following exposition-only alias templates may appear in deduction guides for associative containers:

  template<class InputIterator>
  using iter_value_type =
    typename iterator_traits<InputIterator>::value_type;  // exposition only
  template<class InputIterator>
  using iter_key_type = remove_const_t<
    typename iterator_traits<InputIterator>::value_type::first_type>;  // exposition only

§ 22.4.1 ©ISO/IEC 2020 – All rights reserved

846

ISO/IEC JTC1 SC22 WG21 N4860
template<class InputIterator>
using iter-mapped-type =
  typename iterator_traits<InputIterator>::value_type::second_type;  // exposition only

template<class InputIterator>
using iter-to-alloc-type =
  pair<typename iterator_traits<InputIterator>::value_type::first_type,    
        typename iterator_traits<InputIterator>::value_type::second_type>;  // exposition only

22.4.4 Class template map

22.4.4.1 Overview

A map is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of values of another type T based on the keys. The map class supports bidirectional iterators.

A map meets all of the requirements of a container, of a reversible container (22.2), of an associative container (22.2.6), and of an allocator-aware container (Table 76). A map also provides most operations described in 22.2.6 for unique keys. This means that a map supports the a_uniq operations in 22.2.6 but not the a_eq operations. For a map<Key,T> the key_type is Key and the value_type is pair<const Key,T>. Descriptions are provided here only for operations on map that are not described in one of those tables or for operations where there is additional semantic information.

namespace std {
    template<class Key, class T, class Compare = less<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class map {
        public:
        // types
        using key_type = Key;
        using mapped_type = T;
        using value_type = pair<const Key, T>听过;
        using key_compare = Compare;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using size_type = implementation-defined; // see 22.2
        using difference_type = implementation-defined; // see 22.2
        using iterator = implementation-defined; // see 22.2
        using const_iterator = implementation-defined; // see 22.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;
        using node_type = unspecified;
        using insert_return_type = insert-return-type<iterator, node_type>;

        class value_compare {
            friend class map;
            protected:
                Compare comp;
            value_compare(Compare c) : comp(c) {}
            public:
                bool operator()(const value_type& x, const value_type& y) const {
                    return comp(x.first, y.first);
                }
        };

{
// swap
}

22.4.4.2 Constructors, copy, and assignment [map.cons]

explicit map(const Compare& comp, const Allocator& = Allocator());
Effects: Constructs an empty map using the specified comparison object and allocator.
Complexity: Constant.

template<class InputIterator>
map(InputIterator first, InputIterator last, const Compare& comp = Compare(), const Allocator& = Allocator());
Effects: Constructs an empty map using the specified comparison object and allocator, and inserts elements from the range [first, last).
Complexity: Linear in \(N\) if the range [first, last) is already sorted using \(comp\) and otherwise \(N \log N\), where \(N\) is last - first.

22.4.4.3 Element access [map.access]
mapped_type& operator[](const key_type& x);
Effects: Equivalent to: return try_emplace(x).first->second;
mapped_type& operator[](key_type&& x);
Effects: Equivalent to: return try_emplace(move(x)).first->second;
mapped_type& at(const key_type& x);
const mapped_type& at(const key_type& x) const;
Returns: A reference to the mapped_type corresponding to \(x\) in *this.
Throws: An exception object of type out_of_range if no such element is present.
Complexity: Logarithmic.

22.4.4.4 Modifiers [map.modifiers]
template<class P>
pair<iterator, bool> insert(P&& x);
template<class P>
iterator insert(const_iterator position, P&& x);
Constraints: is_constructible_v<value_type, P&&> is true.
Effects: The first form is equivalent to `return emplace(std::forward<P>(x))`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x))`.

```
// These functions try to insert an object into a map.  If the key already
// exists in the map, nothing happens.  Otherwise, the function returns an
// iterator to the new element.  The bool component indicates whether the
// insertion was successful.

template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
```

```
// Returns the iterator to the element inserted or is already present.

template<class... Args>
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

Preconditions: `value_type` is `Cpp17EmplaceConstructible` into map from `piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...)`.

Effects: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...)`.

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

Complexity: The same as `emplace` and `emplace_hint`, respectively.

```
// These functions try to assign an object into a map.  If the key already
// exists in the map, it is assigned.  If the key is not present in the map,
// it inserts a new object.

template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
```

```
// Returns the iterator to the element inserted or is already present.

template<class M>
iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
```

Mandates: `is_assignable_v<mapped_type&, M&&>` is true.

Preconditions: `value_type` is `Cpp17EmplaceConstructible` into map from `k, forward<M>(obj)`.

Effects: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k, std::forward<M>(obj)`.

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

Complexity: The same as `emplace` and `emplace_hint`, respectively.

```
// These functions try to assign an object into a map.  If the key already
// exists in the map, it is assigned.  If the key is not present in the map,
// it inserts a new object.

template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
```

```
// Returns the iterator to the element inserted or is already present.

template<class M>
iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

Mandates: `is_assignable_v<mapped_type&, M&&>` is true.

Preconditions: `value_type` is `Cpp17EmplaceConstructible` into map from `move(k), forward<M>(obj)`.

Effects: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k), std::forward<M>(obj)`.

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

Complexity: The same as `emplace` and `emplace_hint`, respectively.
22.4.4.5 Erasure

```
template<class Key, class T, class Compare, class Allocator, class Predicate>
  typename map<Key, T, Compare, Allocator>::size_type
  erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);
```

1 Effects: Equivalent to:
```
  auto original_size = c.size();
  for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
      i = c.erase(i);
    } else {
      ++i;
    }
  }
  return original_size - c.size();
```

22.4.5 Class template multimap

22.4.5.1 Overview

1 A multimap is an associative container that supports equivalent keys (possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type `T` based on the keys. The multimap class supports bidirectional iterators.

2 A multimap meets all of the requirements of a container and of a reversible container (22.2), of an associative container (22.2.6), and of an allocator-aware container (Table 76). A multimap also provides most operations described in 22.2.6 for equal keys. This means that a multimap supports the `a_eq` operations in 22.2.6 but not the `a_uniq` operations. For a `multimap<Key,T>` the `key_type` is `Key` and the `value_type` is `pair<const Key,T>`. Descriptions are provided here only for operations on `multimap` that are not described in one of those tables or for operations where there is additional semantic information.

```
namespace std {
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>
  class multimap {
    public:
      // types
      using key_type = Key;
      using mapped_type = T;
      using value_type = pair<const Key, T>;

22.4.5.2 Constructors [multimap.cons]

explicit multimap(const Compare& comp, const Allocator& = Allocator());
   Effects: Constructs an empty multimap using the specified comparison object and allocator.
2   Complexity: Constant.

template<class InputIterator>
multimap(InputIterator first, InputIterator last,
         const Compare& comp = Compare(),
         const Allocator& = Allocator());
   Effects: Constructs an empty multimap using the specified comparison object and allocator, and inserts
   elements from the range [first, last).
4   Complexity: Linear in N if the range [first, last) is already sorted using comp and otherwise
   N log N, where N is last - first.

22.4.5.3 Modifiers [multimap.modifiers]

template<class P> iterator insert(P&& x);

1   Constraints: is_constructible_v<value_type, P&&> is true.

2   Effects: The first form is equivalent to return emplace(std::forward<P>(x)). The second form is
   equivalent to return emplace_hint(position, std::forward<P>(x)).

22.4.5.4 Erasure [multimap.erasure]

template<class Key, class T, class Compare, class Allocator, class Predicate>
   typename multimap<Key, T, Compare, Allocator>::size_type
   erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);
1   Effects: Equivalent to:
   auto original_size = c.size();
   for (auto i = c.begin(), last = c.end(); i != last; ) {
      if (pred(*i)) {
         i = c.erase(i);
      } else {
         ++i;
      }
   }
   return original_size - c.size();
22.4.6 Class template `set`

22.4.6.1 Overview

A *set* is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of the keys themselves. The *set* class supports bidirectional iterators.

A *set* meets all of the requirements of a container, of a reversible container (22.2), of an associative container (22.2.6), and of an allocator-aware container (Table 76). A *set* also provides most operations described in 22.4.6 for unique keys. This means that a *set* supports the *a_uniq* operations in 22.2.6 but not the *a_eq* operations. For a *set<Key>* both the *key_type* and *value_type* are `Key`. Descriptions are provided here only for operations on *set* that are not described in one of these tables and for operations where there is additional semantic information.

```cpp
namespace std {
    template<class Key, class Compare = less<Key>,
             class Allocator = allocator<Key>>
    class set {
        public:
        // types
        using key_type = Key;
        using key_compare = Compare;
        using value_type = Key;
        using value_compare = Compare;

noexcept(noexcept(x.swap(y)));

22.4.6.2 Constructors, copy, and assignment

[set.cons]
explicit set(const Compare& comp, const Allocator& = Allocator());

Effects: Constructs an empty set using the specified comparison objects and allocator.

Complexity: Constant.

template<class InputIterator>
set(InputIterator first, InputIterator last,
const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty set using the specified comparison object and allocator, and inserts elements from the range [first, last).
Complexity: Linear in $N$ if the range $[\text{first}, \text{last})$ is already sorted using $\text{comp}$ and otherwise $N \log N$, where $N$ is $\text{last} - \text{first}$.

22.4.6.3 Erasure

```cpp
template<class Key, class Compare, class Allocator, class Predicate>
typename set<Key, Compare, Allocator>::size_type
erase_if(set<Key, Compare, Allocator>& c, Predicate pred);
```

**Effects:** Equivalent to:

```cpp
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();
```

22.4.7 Class template multiset

22.4.7.1 Overview

A `multiset` is an associative container that supports equivalent keys (possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The `multiset` class supports bidirectional iterators.

A `multiset` meets all of the requirements of a container, of a reversible container (22.2), of an associative container (22.2.6), and of an allocator-aware container (Table 76). `multiset` also provides most operations described in 22.2.6 for duplicate keys. This means that a `multiset` supports the `a_eq` operations in 22.2.6 but not the `a_uniq` operations. For a `multiset<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on `multiset` that are not described in one of these tables and for operations where there is additional semantic information.

```cpp
namespace std {
    template<class Key, class Compare = less<Key>,
             class Allocator = allocator<Key>>
    class multiset {
        public:
            // types
            using key_type = Key;
            using key_compare = Compare;
            using value_type = Key;
            using value_compare = Compare;
            using allocator_type = Allocator;
            using pointer = typename allocator_traits<Allocator>::pointer;
            using const_pointer = typename allocator_traits<Allocator>::const_pointer;
            using reference = value_type&;
            using const_reference = const value_type&;
            using size_type = implementation-defined; // see 22.2
            using difference_type = implementation-defined; // see 22.2
            using iterator = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;
            using node_type = unspecified;

            // 22.4.7.2, construct/copy/destroy
            multiset() : multiset(Compare()) {};
            explicit multiset(const Compare& comp, const Allocator& = Allocator());
            template<class InputIterator>
            multiset(InputIterator first, InputIterator last,
                      const Compare& comp = Compare(), const Allocator& = Allocator());
            multiset(const multiset& x);
            multiset(multiset&& x);
    }
```

    noexcept(noexcept(x.swap(y)));
}

22.4.7.2 Constructors

explicit multiset(const Compare& comp, const Allocator& = Allocator());

Effects: Constructs an empty multiset using the specified comparison object and allocator.

Complexity: Constant.

template<class InputIterator>
multiset(InputIterator first, InputIterator last,
         const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty multiset using the specified comparison object and allocator, and inserts
elements from the range [first, last).

Complexity: Linear in \(N\) if the range [first, last) is already sorted using \(comp\) and otherwise
\(N \log N\), where \(N\) is last - first.

22.4.7.3 Erasure

template<class Key, class Compare, class Allocator, class Predicate>
type_name multiset<Key, Compare, Allocator>::size_type
    erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);

Effects: Equivalent to:

auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();

22.5 Unordered associative containers

22.5.1 In general

The header <unordered_map> defines the class templates unordered_map and unordered_multimap; the
header <unordered_set> defines the class templates unordered_set and unordered_multiset.

The exposition-only alias templates iter-value-type, iter-key-type, iter-mapped-type, and iter-to-
alloc-type defined in 22.4.1 may appear in deduction guides for unordered containers.

22.5.2 Header <unordered_map> synopsis

#include <compare>    // see 17.11.1
#include <initializer_list>    // see 17.10.1

namespace std {
    // 22.5.4, class template unordered_map
    template<class Key,

22.5.4 Class template unordered_map

22.5.4.1 Overview

1 An unordered_map is an unordered associative container that supports unique keys (an unordered_map contains at most one of each key value) and that associates values of another type mapped_type with the keys. The unordered_map class supports forward iterators.

2 An unordered_map meets all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 76). It provides the operations described in the preceding requirements table for unique keys; that is, an unordered_map supports the a_uniq operations in that table, not the a_eq operations. For an unordered_map<Key, T> the key type is Key, the mapped type is T, and the value type is pair<const Key, T>.

3 Subclause 22.5.4 only describes operations on unordered_map that are not described in one of the requirement tables, or for which there is additional semantic information.
namespace std {
    template<class Key,
             class T,
             class Hash = hash<Key>,
             class Pred = equal_to<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class unordered_map {

A size_type parameter type in an unordered_map deduction guide refers to the size_type member type of the type deduced by the deduction guide.

22.5.4.2 Constructors

unordered_map() : unordered_map(size_type(see below)) { }
explicit unordered_map(size_type n,  
    const hasher& hf = hasher(),  
    const key_equal& eql = key_equal(),  
    const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_map using the specified hash function, key equality predicate, and allocator, and using at least n buckets. For the default constructor, the number of buckets is implementation-defined. max_load_factor() returns 1.0.

Complexity: Constant.

template<class InputIterator>  
unordered_map(InputIterator f, InputIterator l,  
    size_type n = see below,  
    const hasher& hf = hasher(),  
    const key_equal& eql = key_equal(),  
    const allocator_type& a = allocator_type());  
unordered_map(initializer_list<value_type> il,  
    size_type n = see below,  
    const hasher& hf = hasher(),  
    const key_equal& eql = key_equal(),  
    const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_map using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f, l) for the first form, or from the range [il.begin(), il.end()) for the second form. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

22.5.4.3 Element access

mapped_type& operator[](const key_type& k);

Effects: Equivalent to: return try_emplace(k).first->second;

mapped_type& operator[](key_type&& k);

Effects: Equivalent to: return try_emplace(move(k)).first->second;

mapped_type& at(const key_type& k);  
const mapped_type& at(const key_type& k) const;

Returns: A reference to x.second, where x is the (unique) element whose key is equivalent to k.

Throws: An exception object of type out_of_range if no such element is present.

22.5.4.4 Modifiers

template<class P>  
pair<iterator, bool> insert(P&& obj);

Constraints: is_constructible_v<value_type, P&&> is true.

Effects: Equivalent to: return emplace(std::forward<P>(obj));

template<class P>  
iterator insert(const_iterator hint, P&& obj);

Constraints: is_constructible_v<value_type, P&&> is true.

Effects: Equivalent to: return emplace_hint(hint, std::forward<P>(obj));

template<class... Args>  
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);  
template<class... Args>  
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);

Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).
Effects: If the map already contains an element whose key is equivalent to \( k \), there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

Returns: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

template<class... Args>
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);

Preconditions: `value_type` is `Cpp17EmplaceConstructible` into unordered_map from `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

Effects: If the map already contains an element whose key is equivalent to \( k \), there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

Returns: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);

Mandates: `is_assignable_v<mapped_type&, M&&>` is `true`.

Preconditions: `value_type` is `Cpp17EmplaceConstructible` into unordered_map from \( k \), `std::forward<M>(obj)`.

Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns `std::forward<M>(obj)` to \( e.second \). Otherwise inserts an object of type `value_type` constructed with \( k \), `std::forward<M>(obj)`.

Returns: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);

Mandates: `is_assignable_v<mapped_type&, M&&>` is `true`.

Preconditions: `value_type` is `Cpp17EmplaceConstructible` into unordered_map from `std::move(k)`, `std::forward<M>(obj)`.

Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns `std::forward<M>(obj)` to \( e.second \). Otherwise inserts an object of type `value_type` constructed with `std::move(k)`, `std::forward<M>(obj)`.

Returns: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

### 22.5.4.5 Erasure

`erase_if(unordered_map<K, T, H, P, A>& c, Predicate pred)`

Effects: Equivalent to:

```cpp
auto original_size = c.size();
```
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();

22.5.5 Class template unordered_multimap

22.5.5.1 Overview

1 An unordered_multimap is an unordered associative container that supports equivalent keys (an instance of unordered_multimap may contain multiple copies of each key value) and that associates values of another type mapped_type with the keys. The unordered_multimap class supports forward iterators.

2 An unordered_multimap meets all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 76). It provides the operations described in the preceding requirements table for equivalent keys; that is, an unordered_multimap supports the a_eq operations in that table, not the a_uniq operations. For an unordered_multimap<Key, T> the key type is Key, the mapped type is T, and the value type is pair<const Key, T>.

3 Subclause 22.5.5 only describes operations on unordered_multimap that are not described in one of the requirement tables, or for which there is additional semantic information.

namespace std {
    template<class Key, class T, class Hash = hash<Key>, class Pred = equal_to<Key>, class Allocator = allocator<pair<const Key, T>>>
    class unordered_multimap {
    public:

explicit unordered_multimap(size_type n,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multimap using the specified hash function, key equality predicate, and allocator, and using at least n buckets. For the default constructor, the number of buckets is implementation-defined. max_load_factor() returns 1.0.

Complexity: Constant.

template<class InputIterator>
unordered_multimap(InputIterator f, InputIterator l,
    size_type n = see below,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());
unordered_multimap(initializer_list<value_type> il,
    size_type n = see below,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multimap using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f, l) for the first form, or from the range [il.begin(), il.end()) for the second form. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

22.5.5.3 Modifiers

template<class P>
iterator insert(P&& obj);

Constraints: is_constructible_v<value_type, P&&> is true.

Effects: Equivalent to: return emplace(std::forward<P>(obj));

template<class P>
iterator insert(const_iterator hint, P&& obj);

Constraints: is_constructible_v<value_type, P&&> is true.

Effects: Equivalent to: return emplace_hint(hint, std::forward<P>(obj));

22.5.5.4 Erasure

template<class K, class T, class H, class P, class A, class Predicate>
typename unordered_multimap<K, T, H, P, A>::size_type
erase_if(unordered_multimap<K, T, H, P, A>& c, Predicate pred);

Effects: Equivalent to:

auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();

22.5.6 Class template unordered_set

22.5.6.1 Overview

An unordered_set is an unordered associative container that supports unique keys (an unordered_set contains at most one of each key value) and in which the elements’ keys are the elements themselves. The unordered_set class supports forward iterators.
An unordered_set meets all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 76). It provides the operations described in the preceding requirements table for unique keys; that is, an unordered_set supports the a_uniq operations in that table, not the a_eq operations. For an unordered_set<Key> the key type and the value type are both Key. The iterator and const_iterator types are both constant iterator types. It is unspecified whether they are the same type.

Subclause 22.5.6 only describes operations on unordered_set that are not described in one of the requirement tables, or for which there is additional semantic information.

22.5.7 Class template unordered_multiset

22.5.7.1 Overview

An unordered_multiset is an unordered associative container that supports equivalent keys (an instance of unordered_multiset may contain multiple copies of the same key value) and in which each element’s key is the element itself. The unordered_multiset class supports forward iterators.

An unordered_multiset meets all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 76). It provides the operations described in the preceding requirements table for equivalent keys; that is, an unordered_multiset supports the a_eq operations in that table, not the a_uniq operations. For an unordered_multiset<Key> the key type and the value type are both Key. The iterator and const_iterator types are both constant iterator types. It is unspecified whether they are the same type.

Subclause 22.5.7 only describes operations on unordered_multiset that are not described in one of the requirement tables, or for which there is additional semantic information.

void swap(unordered_multiset<Key, Hash, Pred, Alloc>& x,
    unordered_multiset<Key, Hash, Pred, Alloc>& y)
noexcept(noexcept(x.swap(y)));

A size_type parameter type in an unordered_multiset deduction guide refers to the size_type member type of the type deduced by the deduction guide.

22.5.7.2 Constructors

unordered_multiset() : unordered_multiset(size_type(see below)) { }
explicit unordered_multiset(size_type n,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multiset using the specified hash function, key equality predicate, and allocator, and using at least n buckets. For the default constructor, the number of
buckets is implementation-defined. \texttt{max_load_factor()} returns 1.0.

\textit{Complexity:} Constant.

\begin{verbatim}
template<class InputIterator>
unordered_multiset(InputIterator f, InputIterator l,
    size_type n = see below,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());
unordered_multiset(initializer_list<value_type> il,
    size_type n = see below,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());
\end{verbatim}

\textit{Effects:} Constructs an empty \texttt{unordered_multiset} using the specified hash function, key equality predicate, and allocator, and using at least \texttt{n} buckets. If \texttt{n} is not provided, the number of buckets is implementation-defined. Then inserts elements from the range \texttt{[f, l)} for the first form, or from the range \texttt{[il.begin(), il.end())} for the second form. \texttt{max_load_factor()} returns 1.0.

\textit{Complexity:} Average case linear, worst case quadratic.

\subsection*{22.5.7.3 Erasure}

\begin{verbatim}
template<class K, class H, class P, class A, class Predicate>
typename unordered_multiset<K, H, P, A>::size_type
    erase_if(unordered_multiset<K, H, P, A>& c, Predicate pred);
\end{verbatim}

\textit{Effects:} Equivalent to:

\begin{verbatim}
    auto original_size = c.size();
    for (auto i = c.begin(), last = c.end(); i != last; ) {
        if (pred(*i)) {
            i = c.erase(i);
        } else {
            ++i;
        }
    }
    return original_size - c.size();
\end{verbatim}

\section*{22.6 Container adaptors}

\subsection*{22.6.1 In general}

The headers \texttt{<queue>} and \texttt{<stack>} define the container adaptors \texttt{queue}, \texttt{priority_queue}, and \texttt{stack}.

The container adaptors each take a \texttt{Container} template parameter, and each constructor takes a \texttt{Container} reference argument. This container is copied into the \texttt{Container} member of each adapter. If the container takes an allocator, then a compatible allocator may be passed in to the adapter’s constructor. Otherwise, normal copy or move construction is used for the container argument. The first template parameter \texttt{T} of the container adaptors shall denote the same type as \texttt{Container::value_type}.

For container adaptors, no \texttt{swap} function throws an exception unless that exception is thrown by the swap of the adapter’s \texttt{Container} or \texttt{Compare} object (if any).

A deduction guide for a container adaptor shall not participate in overload resolution if any of the following are true:

1. It has an \texttt{InputIterator} template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
2. It has a \texttt{Compare} template parameter and a type that qualifies as an allocator is deduced for that parameter.
3. It has a \texttt{Container} template parameter and a type that qualifies as an allocator is deduced for that parameter.
4. It has an \texttt{Allocator} template parameter and a type that does not qualify as an allocator is deduced for that parameter.
It has both `Container` and `Allocator` template parameters, and `uses_allocator_v<Container, Allocator>` is false.

22.6.2 Header `<queue>` synopsis

```cpp
#include <compare>  // see 17.11.1
#include <initializer_list>  // see 17.10.1

namespace std {
    template<class T, class Container = deque<T>> class queue {
        template<class T, class Container>
        bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
        template<class T, class Container>
        bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
        template<class T, class Container>
        bool operator<(const queue<T, Container>& x, const queue<T, Container>& y);
        template<class T, class Container>
        bool operator>(const queue<T, Container>& x, const queue<T, Container>& y);
        template<class T, class Container>
        bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);

        class priority_queue {
        template<class T, class Container, class Compare>
            void swap(priority_queue<T, Container, Compare>& x, priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));
            template<class T, class Container, class Compare, class Alloc>
                struct uses_allocator<priority_queue<T, Container, Compare>, Alloc>;
    } // namespace std
```
template<class T, three_way_comparable Container>
compare_three_way_result_t<Container>
operator<=>(const stack<T, Container>& x, const stack<T, Container>& y);

template<class T, class Container>
void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));

template<class T, class Container, class Alloc>
struct uses_allocator<stack<T, Container>, Alloc>;

22.6.4 Class template queue

22.6.4.1 Definition

Any sequence container supporting operations front(), back(), push_back() and pop_front() can be used to instantiate queue. In particular, list (22.3.10) and deque (22.3.8) can be used.

namespace std {

template<class T, class Container = deque<T>>
class queue {

public:

using value_type = typename Container::value_type;
using reference = typename Container::reference;
using const_reference = typename Container::const_reference;
using size_type = typename Container::size_type;
using container_type = Container;

protected:

    Container c;

public:

    queue() : queue(Container()) {}
    explicit queue(const Container&);
    explicit queue(Container&&);
    template<class Alloc> explicit queue(const Alloc&);
    template<class Alloc> queue(const Container&, const Alloc&);
    template<class Alloc> queue(Container&&, const Alloc&);
    template<class Alloc> queue(const queue&, const Alloc&);
    template<class Alloc> queue(queue&&, const Alloc&);

    [[nodiscard]] bool empty() const { return c.empty(); }
    size_type size() const { return c.size(); }
    reference front() { return c.front(); }
    const_reference front() const { return c.front(); }
    reference back() { return c.back(); }
    const_reference back() const { return c.back(); }
    void push(const value_type& x) { c.push_back(x); }
    void push(value_type&& x) { c.push_back(std::move(x)); }
    template<class... Args>
    decltype(auto) emplace(Args&&... args) {
        return c.emplace_back(std::forward<Args>(args)...); }
    void pop() { c.pop_front(); }
    void swap(queue& q) noexcept(is_nothrow_swappable_v<Container>) {
                using std::swap; swap(c, q.c); }
};

template<class Container>
queue(Container) -> queue<typename Container::value_type, Container>;

template<class Container, class Allocator>
queue(Container, Allocator) -> queue<typename Container::value_type, Container>;

template<class T, class Container>
void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));

§ 22.6.4.1 © ISO/IEC 2020 – All rights reserved 888
template<class T, class Container, class Alloc>
struct uses_allocator<queue<T, Container>, Alloc>
    : uses_allocator<Container, Alloc>::type { };  

22.6.4.2 Constructors

explicit queue(const Container& cont);
1  Effects: Initializes c with cont.

explicit queue(Container&& cont);
2  Effects: Initializes c with std::move(cont).

22.6.4.3 Constructors with allocators

1 If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

template<class Alloc> explicit queue(const Alloc& a);
2  Effects: Initializes c with a.

template<class Alloc> queue(const container_type& cont, const Alloc& a);
3  Effects: Initializes c with cont as the first argument and a as the second argument.

template<class Alloc> queue(container_type&& cont, const Alloc& a);
4  Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.

template<class Alloc> queue(const queue& q, const Alloc& a);
5  Effects: Initializes c with q.c as the first argument and a as the second argument.

template<class Alloc> queue(queue&& q, const Alloc& a);
6  Effects: Initializes c with std::move(q.c) as the first argument and a as the second argument.

22.6.4.4 Operators

template<class T, class Container>
bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
1  Returns: x.c == y.c.

template<class T, class Container>
bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
2  Returns: x.c != y.c.

template<class T, class Container>
bool operator< (const queue<T, Container>& x, const queue<T, Container>& y);
3  Returns: x.c < y.c.

template<class T, class Container>
bool operator> (const queue<T, Container>& x, const queue<T, Container>& y);
4  Returns: x.c > y.c.

template<class T, class Container>
bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);
5  Returns: x.c <= y.c.

template<class T, class Container>
bool operator>=(const queue<T, Container>& x, const queue<T, Container>& y);
6  Returns: x.c >= y.c.

§ 22.6.4.4 ©ISO/IEC 2020 – All rights reserved
template<class T, three_way_comparable Container>
    compare_three_way_result_t<Container>
    operator<=>(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c <=> y.c.

22.6.4.5 Specialized algorithms

template<class T, class Container>
    void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));

Constraints: is_swappable_v<Container> is true.

Effects: As if by x.swap(y).

22.6.5 Class template priority_queue

22.6.5.1 Overview

Any sequence container with random access iterator and supporting operations front(), push_back() and pop_back() can be used to instantiate priority_queue. In particular, vector (22.3.11) and deque (22.3.8) can be used. Instantiating priority_queue also involves supplying a function or function object for making priority comparisons; the library assumes that the function or function object defines a strict weak ordering (25.8).

namespace std {
    template<class T, class Container = vector<T>,
             class Compare = less<typename Container::value_type>>
    class priority_queue {
public:
        using value_type = typename Container::value_type;
        using reference = typename Container::reference;
        using const_reference = typename Container::const_reference;
        using size_type = typename Container::size_type;
        using container_type = Container;
        using value_compare = Compare;

protected:
        Container c;
        Compare comp;

public:
        priority_queue() : priority_queue(Compare()) {}  
        explicit priority_queue(const Compare& x) : priority_queue(x, Container()) {}  
        priority_queue(const Compare& x, const Container&);  
        priority_queue(const Compare& x, Container&&);  
        template<class InputIterator>
            priority_queue(InputIterator first, InputIterator last, const Compare& x,
                const Container&);  
        template<class InputIterator>
            priority_queue(InputIterator first, InputIterator last,
                const Compare& x = Compare(), Container&& = Container());  
        template<class Alloc>
            explicit priority_queue(const Alloc&);  
        template<class Alloc>
            explicit priority_queue(const Compare&, const Alloc&);  
        template<class Alloc>
            priority_queue(const Compare&, const Container&, const Alloc&);  
        template<class Alloc>
            priority_queue(const Compare&, Container&&, const Alloc&);  
        template<class Alloc>
            priority_queue(priority_queue&, const Alloc&);  
        template<class Alloc>
            priority_queue(priority_queue&&, const Alloc&);
    }[[nodiscard]] bool empty() const { return c.empty(); }  
        size_type size() const { return c.size(); }  
        const_reference top() const { return c.front(); }  
        void push(const value_type& x);  
        void push(value_type&& x);  
        template<class... Args> void emplace(Args&&... args);  
        void pop();
};
void swap(priority_queue& q) noexcept(is_nothrow_swappable_v<Container> &&
    is_nothrow_swappable_v<Compare>)
{
    using std::swap; swap(c, q.c); swap(comp, q.comp);
}

template<class Compare, class Container>
priority_queue(Compare, Container)
    -> priority_queue<typename Container::value_type, Container, Compare>;

template<class InputIterator,
    class Compare = less<typename iterator_traits<InputIterator>::value_type>,
    class Container = vector<typename iterator_traits<InputIterator>::value_type>>
priority_queue(InputIterator, InputIterator, Compare = Compare(), Container = Container())
-> priority_queue<typename iterator_traits<InputIterator>::value_type, Container, Compare>;

template<class Compare, class Container, class Allocator>
priority_queue(Compare, Container, Allocator)
    -> priority_queue<typename Container::value_type, Container, Compare>;

// no equality is provided

void swap(priority_queue<T, Container, Compare>& x,
    priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));

template<class Alloc> explicit priority_queue(const Alloc& a);

Effects: Initializes c with a and value-initializes comp.

template<class Alloc> priority_queue(const Compare& compare, const Alloc& a);

Effects: Initializes c with a and initializes comp with compare.

template<class Alloc>
priority_queue(const Compare& compare, const Container& cont, const Alloc& a);

Effects: Initializes c with cont as the first argument and a as the second argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

22.6.5.2 Constructors

priority_queue(const Compare& x, const Container& y);
priority_queue(const Compare& x, Container&& y);

Preconditions: x defines a strict weak ordering (25.8).

Effects: Initializes comp with x and c with y (copy constructing or move constructing as appropriate); calls make_heap(c.begin(), c.end(), comp).

template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x, const Container& y);
template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare(),
    Container&& y = Container());

Preconditions: x defines a strict weak ordering (25.8).

Effects: Initializes comp with x and c with y (copy constructing or move constructing as appropriate); calls c.insert(c.end(), first, last); and finally calls make_heap(c.begin(), c.end(), comp).

22.6.5.3 Constructors with allocators

If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

template<class Alloc> explicit priority_queue(const Alloc& a);

Effects: Initializes c with a and value-initializes comp.

template<class Alloc> priority_queue(const Compare& compare, const Alloc& a);

Effects: Initializes c with a and initializes comp with compare.

template<class Alloc>
priority_queue(const Compare& compare, const Container& cont, const Alloc& a);

Effects: Initializes c with cont as the first argument and a as the second argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).
template<class Alloc>
    priority_queue(const Compare& compare, Container&& cont, const Alloc& a);

    Effects: Initializes \( c \) with \( \text{std::move}(\text{cont}) \) as the first argument and \( a \) as the second argument, and initializes \( \text{comp} \) with \( \text{compare} \); calls \( \text{make_heap}(\text{c.begin()}, \text{c.end()}, \text{comp}) \).

template<class Alloc> priority_queue(const priority_queue& q, const Alloc& a);

    Effects: Initializes \( c \) with \( q.c \) as the first argument and \( a \) as the second argument, and initializes \( \text{comp} \) with \( q.\text{comp} \).

template<class Alloc> priority_queue(priority_queue&& q, const Alloc& a);

    Effects: Initializes \( c \) with \( \text{std::move}(q.c) \) as the first argument and \( a \) as the second argument, and initializes \( \text{comp} \) with \( \text{std::move}(q.\text{comp}) \).

22.6.5.4 Members

    void push(const value_type& x);

    Effects: As if by:
    
        \( c.\text{push}\_\text{back}(x) \);
        \( \text{push}\_\text{heap}(c.\text{begin()}, c.\text{end()}, \text{comp}) \);

    void push(value_type&& x);

    Effects: As if by:
    
        \( c.\text{push}\_\text{back}(\text{std::move}(x)) \);
        \( \text{push}\_\text{heap}(c.\text{begin()}, c.\text{end()}, \text{comp}) \);

    template<class... Args> void emplace(Args&&... args);

    Effects: As if by:
    
        \( c.\text{emplace}\_\text{back}(\text{std::forward<Args>}(\text{args})...) \);
        \( \text{push}\_\text{heap}(c.\text{begin()}, c.\text{end()}, \text{comp}) \);

    void pop();

    Effects: As if by:
    
        \( \text{pop}\_\text{heap}(c.\text{begin()}, c.\text{end()}, \text{comp}) \);
        \( c.\text{pop}\_\text{back}() \);

22.6.5.5 Specialized algorithms

    template<class T, class Container, class Compare>
    void swap(priority_queue<T, Container, Compare>& x, priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));

    Constraints: \( \text{is}\_\text{swappable}\_v<T,\text{Container}> \) is true and \( \text{is}\_\text{swappable}\_v<\text{Compare}> \) is true.

    Effects: As if by \( x.\text{swap}(y) \).

22.6.6 Class template stack

    Any sequence container supporting operations \( \text{back()} \), \( \text{push}\_\text{back()} \) and \( \text{pop}\_\text{back()} \) can be used to instantiate \textit{stack}. In particular, \textit{vector} (22.3.11), \textit{list} (22.3.10) and \textit{deque} (22.3.8) can be used.

22.6.6.1 Definition

    namespace std {
    
        template<class T, class Container = deque<T>>
        class stack {
            public:

                using value_type = typename Container::value_type;

### 22.7 Views

#### 22.7.1 General

The header `<span>` defines the view `span`.

#### 22.7.2 Header `<span>` synopsis

namespace std {

    // constants
    inline constexpr size_t dynamic_extent = numeric_limits<size_t>::max();

    // 22.7.3, class template span
    template<class ElementType, size_t Extent = dynamic_extent>
    class span;

    template<class ElementType, size_t Extent>
    inline constexpr bool ranges::enable_view<span<ElementType, Extent>> =
    Extent == 0 || Extent == dynamic_extent;

    template<class ElementType, size_t Extent>
    inline constexpr bool ranges::enable_borrowed_range<span<ElementType, Extent>> = true;

§ 22.7.2 ©ISO/IEC 2020 – All rights reserved 894
22.7.3 Class template \texttt{span}  

22.7.3.1 Overview

A \texttt{span} is a view over a contiguous sequence of objects, the storage of which is owned by some other object. All member functions of \texttt{span} have constant time complexity.

```cpp
namespace std {
    template<class ElementType, size_t Extent = dynamic_extent>
    class span {
public:
    // constants and types
    using element_type = ElementType;
    using value_type = remove_cv_t<ElementType>;

constexpr span<element_type, dynamic_extent> last(size_type count) const;
constexpr span<element_type, dynamic_extent> subspan(
    size_type offset, size_type count = dynamic_extent) const;

// 22.7.3.5, observers
constexpr size_type size() const noexcept;
constexpr size_type size_bytes() const noexcept;
[[nodiscard]] constexpr bool empty() const noexcept;

// 22.7.3.6, element access
constexpr reference operator[](size_type idx) const;
constexpr reference front() const;
constexpr reference back() const;
constexpr pointer data() const noexcept;

// 22.7.3.7, iterator support
constexpr iterator begin() const noexcept;
constexpr iterator end() const noexcept;
constexpr reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() const noexcept;

private:
    pointer data_; // exposition only
    size_type size_; // exposition only
};

template<class It, class EndOrSize>
span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>;

template<class T, size_t N>
span(T (&)[N]) -> span<T, N>;

private:
    pointer data_; // exposition only
    size_type size_; // exposition only
};

ElementType is required to be a complete object type that is not an abstract class type.

### 22.7.3.2 Constructors, copy, and assignment

```cpp
constexpr span() noexcept;
```  

**Constraints:** Extent == dynamic_extent || Extent == 0 is true.

**Postconditions:** size() == 0 & data() == nullptr.

```cpp
template<class It>
constexpr explicit(extent != dynamic_extent) span(It first, size_type count);
```  

**Constraints:** Let U be remove_reference_t<iter_reference_t<It>>.

1. It satisfies contiguous_iterator.
2. is_convertible_v<U(*)[]> & element_type(*)[] is true. [Note: The intent is to allow only qualification conversions of the iterator reference type to element_type. — end note]

**Preconditions:**
1. [first, first + count) is a valid range.
2. It models contiguous_iterator.
3. If extent is not equal to dynamic_extent, then count is equal to extent.

**Effects:** Initializes data_ with to_address(first) and size_ with count.

**Throws:** Nothing.
template<class It, class End>
constexpr explicit(extent != dynamic_extent) span(It first, End last);

7 Constraints: Let \( U \) be \( \text{remove\_reference}_t<\text{iter\_reference}_t<\text{It}> \).

(7.1) \[ \text{is\_convertible}_v<U(*)[], \text{element\_type}(*[])> \text{ is true. } \text{Note: The intent is to allow only qualification conversions of the iterator reference type to element\_type.} \text{ — end note} \]

(7.2) It satisfies contiguous\_iterator.

(7.3) End satisfies sized\_sentinel\_for<\text{It}>

(7.4) \[ \text{is\_convertible}_v<\text{End}, \text{size\_t}>	ext{ is false.} \]

8 Preconditions:

(8.1) If extent is not equal to dynamic\_extent, then last - first is equal to extent.

(8.2) \([\text{first}, \text{last})\) is a valid range.

(8.3) It models contiguous\_iterator.

(8.4) End models sized\_sentinel\_for<\text{It}>

9 Effects: Initializes data\_ with to\_address(first) and size\_ with last - first.

10 Throws: When and what last - first throws.

template<size_t N> constexpr span(type\_identity_t<element\_type> (&arr)[N]) noexcept;

11 Constraints: Let \( U \) be \( \text{remove\_pointer}_t<\text{decltype}(\text{data}(\text{arr}))> \).

(11.1) \[ \text{extent == dynamic\_extent \| \ N == extent} \text{ is true, and } \]

(11.2) \[ \text{is\_convertible}_v<U(*)[], \text{element\_type}(*[])> \text{ is true. } \text{Note: The intent is to allow only qualification conversions of the array element type to element\_type.} \text{ — end note} \]

12 Effects: Constructs a span that is a view over the supplied array. \text{Note: type\_identity\_t affects class template argument deduction.} — end note

13 Postconditions: size() == N & data() == data(arr) is true.

14 template<class R> constexpr explicit(extent != dynamic_extent) span(R&& r);

15 Constraints: Let \( U \) be \( \text{remove\_reference}_t<\text{ranges\::range\_reference}_t<R>> \).

(14.1) \[ R \text{ satisfies ranges\::contiguous\_range and ranges\::sized\_range.} \]

(14.2) Either \( R \text{ satisfies ranges\::borrowed\_range \| is\_const}_v<\text{element\_type}> \text{ is true.} \)

(14.3) remove\_cvref\_t<R> is not a specialization of span.

(14.4) remove\_cvref\_t<R> is not a specialization of array.

(14.5) \[ \text{is\_array\_v<remove\_cvref\_t<R>> is false.} \]

(14.6) \[ \text{is\_convertible}_v<U(*)[], \text{element\_type}(*[])> \text{ is true. } \text{Note: The intent is to allow only qualification conversions of the range reference type to element\_type.} \text{ — end note} \]

16 Preconditions:

(15.1) If extent is not equal to dynamic\_extent, then ranges\::size(r) is equal to extent.

(15.2) \[ R \text{ models ranges\::contiguous\_range and ranges\::sized\_range.} \]

(15.3) If is\_const\_v<element\_type> is false, \( R \text{ models ranges\::borrowed\_range.} \)

17 Effects: Initializes data\_ with ranges\::data(r) and size\_ with ranges\::size(r).

18 Throws: What and when ranges\::data(r) and ranges\::size(r) throw.

constexpr span(const span other) noexcept = default;

19 Postconditions: other.size() == size() & other.data() == data().

template<class OtherElementType, size_t OtherExtent>
constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;

Constraints:
Preconditions: If extent is not equal to dynamic_extent, then s.size() is equal to extent.

Effects: Constructs a span that is a view over the range [s.data(), s.data() + s.size()).

Postconditions: size() == s.size() && data() == s.data().

Remarks: The expression inside explicit is equivalent to:

extent != dynamic_extent && OtherExtent == dynamic_extent

constexpr span& operator=(const span& other) noexcept = default;

Postconditions: size() == other.size() && data() == other.data().

22.7.3.3 Deduction guides [span.deduct]

template<class It, class EndOrSize>
span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>>;

Constraints: It satisfies contiguous_iterator.

template<class R>
span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;

Constraints: R satisfies ranges::contiguous_range.

22.7.3.4 Subviews [span.sub]

template<size_t Count> constexpr span<element_type, Count> first() const;

Mandates: Count <= Extent is true.

Preconditions: Count <= size() is true.

Effects: Equivalent to: return R{data(), Count}; where R is the return type.

template<size_t Count> constexpr span<element_type, Count> last() const;

Mandates: Count <= Extent is true.

Preconditions: Count <= size() is true.

Effects: Equivalent to: return R{data() + (size() - Count), Count}; where R is the return type.

template<size_t Offset, size_t Count = dynamic_extent>
constexpr span<element_type, see below> subspan() const;

Mandates:
Offset <= Extent && (Count == dynamic_extent || Count <= Extent - Offset)

is true.

Preconditions:
Offset <= size() && (Count == dynamic_extent || Count <= size() - Offset)

is true.

Effects: Equivalent to:

return span<ElementType, see below>(
    data() + Offset, Count != dynamic_extent ? Count : size() - Offset);

Remarks: The second template argument of the returned span type is:

Count != dynamic_extent ? Count :
    (Extent != dynamic_extent ? Extent - Offset :
       dynamic_extent)

castexpr span<Element_type, dynamic_extent> first(size_t count) const;

Preconditions: count <= size() is true.
Effects: Equivalent to: `return {data(), count};`

```cpp
cconstexpr span<element_type, dynamic_extent> last(size_type count) const;
```

Effects: Equivalent to: `return {data() + (size() - count), count};`

```cpp
cconstexpr span<element_type, dynamic_extent> subspan(
    size_type offset, size_type count = dynamic_extent) const;
```

Effects: Equivalent to:
```
return {data() + offset, count == dynamic_extent ? size() - offset : count};
```

### 22.7.3.5 Observers

```cpp
cconstexpr size_type size() const noexcept;
```

Effects: Equivalent to: `return size_;`

```cpp
cconstexpr size_type size_bytes() const noexcept;
```

Effects: Equivalent to: `return size() * sizeof(element_type);`

```cpp
[[nodiscard]] constexpr bool empty() const noexcept;
```

Effects: Equivalent to: `return size() == 0;`

### 22.7.3.6 Element access

```cpp
cconstexpr reference operator[](size_type idx) const;
```

Effects: Equivalent to: `return *(data() + idx);`

```cpp
cconstexpr reference front() const;
```

Effects: Equivalent to: `return *data();`

```cpp
cconstexpr reference back() const;
```

Effects: Equivalent to: `return *(data() + (size() - 1));`

```cpp
cconstexpr pointer data() const noexcept;
```

Effects: Equivalent to: `return data_;`

### 22.7.3.7 Iterator support

```cpp
using iterator = implementation-defined;
```

The type models `contiguous_iterator` (23.3.4.14), meets the `Cpp17RandomAccessIterator` requirements (23.3.5.6), and meets the requirements for `constexpr` iterators (23.3.1). All requirements on container iterators (22.2) apply to `span::iterator` as well.

```cpp
cconstexpr iterator begin() const noexcept;
```

Returns: An iterator referring to the first element in the span. If `empty()` is `true`, then it returns the same value as `end()`.

```cpp
cconstexpr iterator end() const noexcept;
```

Returns: An iterator which is the past-the-end value.
constexpr reverse_iterator rbegin() const noexcept;

Effects: Equivalent to: return reverse_iterator(end());

constexpr reverse_iterator rend() const noexcept;

Effects: Equivalent to: return reverse_iterator(begin());

22.7.3.8 Views of object representation [span.objectrep]

template<class ElementType, size_t Extent>
span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
as_bytes(span<ElementType, Extent> s) noexcept;

Effects: Equivalent to: return R{reinterpret_cast<const byte*>(s.data()), s.size_bytes()};

where R is the return type.

template<class ElementType, size_t Extent>
span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
as_writable_bytes(span<ElementType, Extent> s) noexcept;

Constraints: is_const_v<ElementType> is false.

Effects: Equivalent to: return R{reinterpret_cast<byte*>(s.data()), s.size_bytes()}; where R is the return type.
23 Iterators library

23.1 General

This Clause describes components that C++ programs may use to perform iterations over containers (Clause 22), streams (29.7), stream buffers (29.6), and other ranges (Clause 24).

The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 82.

Table 82: Iterators library summary

}

23.3 Iterator requirements

23.3.1 In general

1 Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. An input iterator \( \text{i} \) supports the expression \(*\text{i} \), resulting in a value of some object type \( T \), called the value type of the iterator. An output iterator \( \text{i} \) has a non-empty set of types that are indirectly writable to the iterator; for each such type \( T \), the expression \(*\text{i} = o \) is valid where \( o \) is a value of type \( T \). For every iterator type \( X \), there is a corresponding signed integer-like type (23.3.4.4) called the difference type of the iterator.

2 Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines six categories of iterators, according to the operations defined on them: input iterators, output iterators, forward iterators, bidirectional iterators, random access iterators, and contiguous iterators, as shown in Table 83.

<table>
<thead>
<tr>
<th>Contiguous</th>
<th>→ Random Access</th>
<th>→ Bidirectional</th>
<th>→ Forward</th>
<th>→ Input</th>
<th>→ Output</th>
</tr>
</thead>
</table>

Table 83: Relations among iterator categories

3 The six categories of iterators correspond to the iterator concepts

(3.1) — input_iterator (23.3.4.9),
(3.2) — output_iterator (23.3.4.10),
(3.3) — forward_iterator (23.3.4.11),
(3.4) — bidirectional_iterator (23.3.4.12)
(3.5) — random_access_iterator (23.3.4.13), and
(3.6) — contiguous_iterator (23.3.4.14), respectively. The generic term iterator refers to any type that models the input_or_output_iterator concept (23.3.4.6).

4 Forward iterators meet all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also meet all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also meet all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified; Contiguous iterators also meet all the requirements of random access iterators and can be used whenever a random access iterator is specified.

5 Iterators that further meet the requirements of output iterators are called mutable iterators. Nonmutable iterators are referred to as constant iterators.

6 In addition to the requirements in this subclause, the nested typedef-names specified in 23.3.2.3 shall be provided for the iterator type. [Note: Either the iterator type must provide the typedef-names directly (in which case iterator_traits pick them up automatically), or an iterator_traits specialization must provide them. —end note]

7 Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. Such a value is called a past-the-end value. Values of an iterator \( \text{i} \) for which the expression \(*\text{i} \) is defined are called dereferenceable. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. [Example: After the declaration of an uninitialized pointer \( \text{x} \) (as with int* \( \text{x} \);), \( \text{x} \) must always be assumed to have a singular value of a pointer. —end example] Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that meet the Cpp17DefaultConstructible
requirements, using a value-initialized iterator as the source of a copy or move operation. [Note: This guarantee is not offered for default-initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. — end note] In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.

8 Most of the library’s algorithmic templates that operate on data structures have interfaces that use ranges. A range is an iterator and a sentinel that designate the beginning and end of the computation, or an iterator and a count that designate the beginning and the number of elements to which the computation is to be applied.

9 An iterator and a sentinel denoting a range are comparable. A range \([i, s)\) is empty if \(i == s\); otherwise, \([i, s)\) refers to the elements in the data structure starting with the element pointed to by \(i\) and up to but not including the element, if any, pointed to by the first iterator \(j\) such that \(j == s\).

10 A sentinel \(s\) is called reachable from an iterator \(i\) if and only if there is a finite sequence of applications of the expression \(++i\) that makes \(i == s\). If \(s\) is reachable from \(i\), \([i, s)\) denotes a valid range.

11 A counted range \(i + [0, n)\) is empty if \(n == 0\); otherwise, \(i + [0, n)\) refers to the \(n\) elements in the data structure starting with the element pointed to by \(i\) and up to but not including the element, if any, pointed to by the result of \(n\) applications of \(++i\). A counted range \(i + [0, n)\) is valid if and only if \(n == 0\) or \(n\) is positive, \(i\) is dereferenceable, and \(+i + [0, -n)\) is valid.

12 The result of the application of library functions to invalid ranges is undefined.

13 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables and concept definitions for the iterators do not specify complexity.

14 Destruction of a non-forward iterator may invalidate pointers and references previously obtained from that iterator.

15 An invalid iterator is an iterator that may be singular.

16 Iterators are called constexpr iterators if all operations provided to meet iterator category requirements are constexpr functions. [Note: For example, the types “pointer to int” and reverse_iterator<int*> are constexpr iterators. — end note]

23.3.2 Associated types

23.3.2.1 Incrementable traits

1 To implement algorithms only in terms of incrementable types, it is often necessary to determine the difference type that corresponds to a particular incrementable type. Accordingly, it is required that if \(W_t\) is the name of a type that models the weakly_incrementable concept (23.3.4.4), the type

\[
\text{iter_difference_t}<W_t>
\]

be defined as the incrementable type’s difference type.

```cpp
namespace std {
    template<class> struct incrementable_traits { };

    template<class T>
    requires is_object_v<T>
    struct incrementable_traits<T> { 
        using difference_type = ptrdiff_t;
    };

    template<class I>
    struct incrementable_traits<const I>
        : incrementable_traits<I> { };

    template<class T>
    requires requires { typename T::difference_type; }
```
struct incrementable_traits<T> {
    using difference_type = typename T::difference_type;
};

template<class T>
requires (!requires { typename T::difference_type; } &&
            requires(const T& a, const T& b) { a - b } -> integral; )
struct incrementable_traits<T> {
    using difference_type = make_signed_t<decltype(declval<T>() - declval<T>())>;
};

template<class T>
using iter_difference_t = see below;

2 Let $R_I$ be remove_cvref_t$I$. The type iter_difference_t$I$ denotes

(2.1) — incrementable_traits$\langle R_I \rangle$::difference_type if iterator_traits$\langle R_I \rangle$ names a specialization generated from the primary template, and

(2.2) — iterator_traits$\langle R_I \rangle$::difference_type otherwise.

3 Users may specialize incrementable_traits on program-defined types.

23.3.2.2 Indirectly readable traits

To implement algorithms only in terms of indirectly readable types, it is often necessary to determine the value type that corresponds to a particular indirectly readable type. Accordingly, it is required that if $R$ is the name of a type that models the indirectly_readable concept (23.3.4.2), the type

\[
\text{iter_value_t}<R>
\]

be defined as the indirectly readable type’s value type.

1

§ 23.3.2.2 ©ISO/IEC 2020 – All rights reserved 910
template<class T> using iter_value_t = see below;

Let \( R_I \) be remove_cvref_t\(<I>\). The type iter_value_t\(<I>\) denotes

(2.1) indirectly_readable_traits\(<R_I>\>::value_type if iterator_traits\(<R_I>\) names a specialization
generated from the primary template, and

(2.2) iterator_traits\(<R_I>\>::value_type otherwise.

Class template indirectly_readable_traits may be specialized on program-defined types.

[Note: Some legacy output iterators define a nested type named value_type that is an alias for void. These
types are not indirectly_readable and have no associated value types. — end note]

3 Class template indirectly_readable_traits may be specialized on program-defined types.

types are not indirectly_readable and have no associated value types. — end note]

Class template indirectly_readable_traits may be specialized on program-defined types.

Class template indirectly_readable_traits may be specialized on program-defined types.

[Note: Some legacy output iterators define a nested type named value_type that is an alias for void. These
types are not indirectly_readable and have no associated value types. — end note]
template<class I>
concept cpp17-bidirectional-iterator =
cpp17-forward-iterator<I> && requires(I i) {
  { --i } -> same_as<I&>;
  { i-- } -> convertible_to<const I&>;
  { *i-- } -> same_as<iter_reference_t<I>>;
};

template<class I>
concept cpp17-random-access-iterator =
cpp17-bidirectional-iterator<I> && totally_ordered<I> && requires(I i, typename incrementable_traits<I>::difference_type n) {
  { i += n } -> same_as<I&>;
  { i -= n } -> same_as<I&>;
  { n + i } -> same_as<I>;
  { i - n } -> same_as<I>;
  { i - i } -> same_as<decltype(n)abwehren>;
  { i[n] } -> convertible_to<iter_reference_t<I>>;
};

3 The members of a specialization iterator_traits<I> generated from the iterator_traits primary template are computed as follows:

(3.1) — If I has valid (13.10.2) member types difference_type, value_type, reference, and iterator_category, then iterator_traits<I> has the following publicly accessible members:

```cpp
using iterator_category = typename I::iterator_category;
using value_type = typename I::value_type;
using difference_type = typename I::difference_type;
using pointer = see below;
using reference = typename I::reference;
```

If the qualified-id I::pointer is valid and denotes a type, then iterator_traits<I>::pointer names that type; otherwise, it names void.

(3.2) — Otherwise, if I satisfies the exposition-only concept cpp17-input-iterator, iterator_traits<I> has the following publicly accessible members:

```cpp
using iterator_category = see below;
using value_type = typename indirectly_readable_traits<I>::value_type;
using difference_type = typename incrementable_traits<I>::difference_type;
using pointer = see below;
using reference = see below;
```

(3.2.1) — If the qualified-id I::pointer is valid and denotes a type, pointer names that type. Otherwise, if decltype(declval<I&>().operator->()) is well-formed, then pointer names that type. Otherwise, pointer names void.

(3.2.2) — If the qualified-id I::reference is valid and denotes a type, reference names that type. Otherwise, reference names iter_reference_t<I>.

(3.2.3) — If the qualified-id I::iterator_category is valid and denotes a type, iterator_category names that type. Otherwise, iterator_category names:

(3.2.3.1) — random_access_iterator_tag if I satisfies cpp17-random-access_iterator, or otherwise
(3.2.3.2) — bidirectional_iterator_tag if I satisfies cpp17-bidirectional_iterator, or otherwise
(3.2.3.3) — forward_iterator_tag if I satisfies cpp17-forward_iterator, or otherwise
(3.2.3.4) — input_iterator_tag.

(3.3) — Otherwise, if I satisfies the exposition-only concept cpp17-iterator, then iterator_traits<I> has the following publicly accessible members:

```cpp
using iterator_category = output_iterator_tag;
```
using value_type = void;
using difference_type = see below;
using pointer = void;
using reference = void;

If the qualified-id incrementable_traits<T>::difference_type is valid and denotes a type, then difference_type names that type; otherwise, it names void.

— Otherwise, iterator_traits<T> has no members by any of the above names.

4 Explicit or partial specializations of iterator_traits may have a member type iterator_concept that is used to indicate conformance to the iterator concepts (23.3.4).

5 iterator_traits is specialized for pointers as

namespace std {
    template<class T>
    requires is_object_v<T>
    struct iterator_traits<T*> {
        using iterator_concept = contiguous_iterator_tag;
        using iterator_category = random_access_iterator_tag;
        using value_type = remove_cv_t<T>;
        using difference_type = ptrdiff_t;
        using pointer = T*;
        using reference = T&;
    };
}

6 [Example: To implement a generic reverse function, a C++ program can do the following:

    template<class BI>
    void reverse(BI first, BI last) {
        typename iterator_traits<BI>::difference_type n =
            distance(first, last);
        --n;
        while(n > 0) {
            typename iterator_traits<BI>::value_type
                tmp = *first;
            *first++ = ***--last;
            *last = tmp;
            n -= 2;
        }
    }

    — end example]

23.3.3 Customization points

23.3.3.1 ranges::iter_move

1 The name ranges::iter_move denotes a customization point object (16.4.2.2.6). The expression ranges::iter_move(E) for a subexpression E is expression-equivalent to:

   (1.1) — iter_move(E), if E has class or enumeration type and iter_move(E) is a well-formed expression when treated as an unevaluated operand, with overload resolution performed in a context that does not include a declaration of ranges::iter_move but does include the declaration

       void iter_move);

   (1.2) — Otherwise, if the expression *E is well-formed:

       (1.2.1) — if *E is an lvalue, std::move(*E);

       (1.2.2) — otherwise, *E.

   (1.3) — Otherwise, ranges::iter_move(E) is ill-formed. [Note: This case can result in substitution failure when ranges::iter_move(E) appears in the immediate context of a template instantiation. — end note]

2 If ranges::iter_move(E) is not equal to *E, the program is ill-formed, no diagnostic required.
### 23.3.3.2 ranges::iter_swap

The name ranges::iter_swap denotes a customization point object (16.4.2.6.2) that exchanges the values (18.4.9) denoted by its arguments.

Let `iter-exchange-move` be the exposition-only function:

```cpp
template<class X, class Y>
constexpr iter_value_t<X> iter-exchange-move(X&& x, Y&& y)
noexcept(noexcept(iter_value_t<X>(iter_move(x))) &&
    noexcept(*x = iter_move(y)));
```

**Effects:** Equivalence to:

- `iter_value_t<X> old_value(iter_move(x));`
- `*x = iter_move(y);`
- `return old_value;`

The expression ranges::iter_swap(E1, E2) for subexpressions E1 and E2 is expression-equivalent to:

1. (void)iter_swap(E1, E2), if either E1 or E2 has class or enumeration type and `iter_swap(E1, E2)` is a well-formed expression with overload resolution performed in a context that includes the declaration

   ```cpp
   template<class I1, class I2>
   void iter_swap(I1, I2) = delete;
   ```

   and does not include a declaration of ranges::iter_swap. If the function selected by overload resolution does not exchange the values denoted by E1 and E2, the program is ill-formed, no diagnostic required.

2. Otherwise, if the types of E1 and E2 each model indirectly_readable, and if the reference types of E1 and E2 model swappable_with (18.4.9), then ranges::swap(*E1, *E2).

3. Otherwise, if the types T1 and T2 of E1 and E2 model indirectly_movable_storable<T1, T2> and indirectly_movable_storable<T2, T1>, then (void)(*E1 = iter-exchange-move(E2, E1)), except that E1 is evaluated only once.

4. Otherwise, ranges::iter_swap(E1, E2) is ill-formed. [Note: This case can result in substitution failure when ranges::iter_swap(E1, E2) appears in the immediate context of a template instantiation. —end note]

### 23.3.4 Iterator concepts

#### 23.3.4.1 General

For a type I, let `ITER_TRAITS(I)` denote the type I if `iterator_traits<I>` names a specialization generated from the primary template. Otherwise, `ITER_TRAITS(I)` denotes `iterator_traits<I>`.

1. If the qualified-id `ITER_TRAITS(I)::iterator_concept` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.

2. Otherwise, if the qualified-id `ITER_TRAITS(I)::iterator_category` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.

3. Otherwise, if `iterator_traits<I>` names a specialization generated from the primary template, then `ITER_CONCEPT(I)` denotes `random_access_iterator_tag`.

4. Otherwise, `ITER_CONCEPT(I)` does not denote a type.

[Note: `ITER_TRAITS` enables independent syntactic determination of an iterator’s category and concept. —end note] [Example:

```cpp
struct I {
    using value_type = int;
    using difference_type = int;

    int operator*() const;
    I& operator++();
    I operator++(int);
    I& operator--();
    I operator--(int);

    bool operator==(I) const;
};
```
bool operator!=(I) const;
}

iterator_traits<I>::iterator_category denotes input_iterator_tag, and ITER_CONCEPT(I) denotes random_access_iterator_tag. —end example

23.3.4.2 Concept indirectly_readable

Types that are indirectly readable by applying operator* model the indirectly_readable concept, including pointers, smart pointers, and iterators.

template<class In>
concept indirectly-readable-impl =
requires(const In in) {
    typename iter_value_t<In>;
    typename iter_reference_t<In>;
    typename iter_rvalue_reference_t<In>;
    { *in } \rightarrow same_as<iter_reference_t<In>>;
    { ranges::iter_move(in) } \rightarrow same_as<iter_rvalue_reference_t<In>>;
} \&\&
common_reference_with<iter_reference_t<In>&&, iter_value_t<In>&> \&\&
common_reference_with<iter_reference_t<In>&&, iter_rvalue_reference_t<In>&&> \&\&
common_reference_with<iter_rvalue_reference_t<In>&&, const iter_value_t<In>&>;

template<class In>
concept indirectly_readable = indirectly-readable-impl<remove_cvref_t<In>>;

2 Given a value i of type I, I models indirectly_readable only if the expression *i is equality-preserving.

[Note: The expression *i is indirectly required to be valid via the exposition-only dereferenceable concept (23.2). —end note]

23.3.4.3 Concept indirectly_writable

The indirectly_writable concept specifies the requirements for writing a value into an iterator’s referenced object.

template<class Out, class T>
concept indirectly_writable =
requires(Out&& o, T&& t) {
    *o = std::forward<T>(t);  // not required to be equality-preserving
    *std::forward<Out>(o) = std::forward<T>(t);  // not required to be equality-preserving
    const_cast<const iter_reference_t<Out>&&>(*o) =
    std::forward<T>(t);  // not required to be equality-preserving
    const_cast<const iter_reference_t<Out>&&>(*std::forward<Out>(o)) =
    std::forward<T>(t);  // not required to be equality-preserving
};

2 Let E be an expression such that decltype((E)) is T, and let o be a dereferenceable object of type Out. Out and T model indirectly_writable<Out, T> only if

(2.1) — If Out and T model indirectly_writable<Out> \&\& same_as<iter_value_t<Out>, decay_t<T>>, then \*o after any above assignment is equal to the value of E before the assignment.

3 After evaluating any above assignment expression, o is not required to be dereferenceable.

4 If E is an xvalue (7.2.1), the resulting state of the object it denotes is valid but unspecified (16.5.5.16).

5 [Note: The only valid use of an operator* is on the left side of the assignment statement. Assignment through the same value of the indirectly writable type happens only once. —end note]

6 [Note: indirectly_writable has the awkward const_cast expressions to reject iterators with prvalue non-proxy reference types that permit rvalue assignment but do not also permit const rvalue assignment. Consequently, an iterator type I that returns std::string by value does not model indirectly_writable<I, std::string>. —end note]

23.3.4.4 Concept weakly_incrementable

The weakly_incrementable concept specifies the requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be equality_comparable.

§ 23.3.4.4 ©ISO/IEC 2020 – All rights reserved 915
template<class T>
inline constexpr bool is_integer_like = see below; // exposition only

template<class T>
inline constexpr bool is_signed_integer_like = see below; // exposition only

template<class I>
concept weakly_incrementable =
default_initializable<I> && movable<I> &&
requires(I i) {
  typename iter_difference_t<I>;
  requires is_signed_integer_like<iter_difference_t<I>>;  // not required to be equality-preserving
  i++;  // not required to be equality-preserving
};

A type I is an integer-class type if it is in a set of implementation-defined class types that behave as integer types do, as defined in below.

The range of representable values of an integer-class type is the continuous set of values over which it is defined. The values 0 and 1 are part of the range of every integer-class type. If any negative numbers are part of the range, the type is a signed-integer-class type; otherwise, it is an unsigned-integer-class type.

For every integer-class type I, let B(I) be a hypothetical extended integer type of the same signedness with the smallest width (6.8.1) capable of representing the same range of values. The width of I is equal to the width of B(I).

Let a and b be objects of integer-class type I, let x and y be objects of type B(I) as described above that represent the same values as a and b respectively, and let c be an lvalue of any integral type.

— For every unary operator @ for which the expression @x is well-formed, @a shall also be well-formed and have the same value, effects, and value category as @x provided that value is representable by I. If @x has type bool, so too does @a; if @x has type B(I), then @a has type I.

— For every assignment operator @= for which c @= x is well-formed, c @= a shall also be well-formed and shall have the same value and effects as c @= x. The expression c @= a shall be an lvalue referring to c.

— For every binary operator @ for which x @ y is well-formed, a @ b shall also be well-formed and shall have the same value, effects, and value category as x @ y provided that value is representable by I. If x @ y has type bool, so too does a @ b; if x @ y has type B(I), then a @ b has type I.

Expressions of integer-class type are explicitly convertible to any integral type. Expressions of integral type are both implicitly and explicitly convertible to any integer-class type. Conversions between integral and integer-class types do not exit via an exception.

An expression E of integer-class type I is contextually convertible to bool as if by bool(E != I(0)).

All integer-class types model regular (18.6) and totally_ordered (18.5.4).

A value-initialized object of integer-class type has value 0.

For every (possibly cv-qualified) integer-class type I, numeric_limits<I> is specialized such that:

— numeric_limits<I>::is_specialized is true,
— numeric_limits<I>::is_signed is true if and only if I is a signed-integer-class type,
— numeric_limits<I>::is_integer is true,
— numeric_limits<I>::is_exact is true,
— numeric_limits<I>::digits is equal to the width of the integer-class type,
— numeric_limits<I>::digits10 is equal to static_cast<int>(digits * log10(2)), and
— numeric_limits<I>::min() and numeric_limits<I>::max() return the lowest and highest representable values of I, respectively, and numeric_limits<I>::lowest() returns numeric_limits<I>::min().
A type \( I \) is integer-like if it models \texttt{integral}\(<I>\) or if it is an integer-class type. A type \( I \) is signed-integer-like if it models \texttt{signed_integral}\(<I>\) or if it is a signed-integer-class type. A type \( I \) is unsigned-integer-like if it models \texttt{unsigned_integral}\(<I>\) or if it is an unsigned-integer-class type.

\( \text{is}-\text{integer-like}\(<I> \) is true if and only if \( I \) is an integer-like type. \( \text{is}-\text{signed-integer-like}\(<I> \) is true if and only if \( I \) is a signed-integer-like type.

Let \( i \) be an object of type \( I \). When \( i \) is in the domain of both pre- and post-increment, \( i \) is said to be incrementable. \( I \) models \texttt{weakly_incrementable}\(<I>\) only if

\begin{itemize}
  \item The expressions \( \texttt{++} i \) and \( i++ \) have the same domain.
  \item If \( i \) is incrementable, then both \( \texttt{++} i \) and \( i++ \) advance \( i \) to the next element.
  \item If \( i \) is incrementable, then \( \texttt{addressof}(\texttt{++} i) \) is equal to \( \texttt{addressof}(i) \).
\end{itemize}

[Note: For \texttt{weakly_incrementable} types, \( a \) equals \( b \) does not imply that \( \texttt{++} a \) equals \( ++b \). (Equality does not guarantee the substitution property or referential transparency.) Algorithms on weakly incrementable types should never attempt to pass through the same incrementable value twice. They should be single-pass algorithms. These algorithms can be used with istreams as the source of the input data through the \texttt{istream_iterator} class template. — end note]

23.3.4.5 Concept \texttt{incrementable} [iterator.concept.inc]

The \texttt{incrementable} concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be \texttt{equality_comparable}. [Note: This supersedes the annotations on the increment expressions in the definition of \texttt{weakly_incrementable}. — end note]

\[
\begin{align*}
\text{template<class I>} & \\
& \text{concept incrementable =} \\
& \quad \text{regular}<I> \&\& \\
& \quad \text{weakly_incrementable}<I> \&\& \\
& \quad \text{requires(I i) \{ \\
& \quad \quad \{ i++ \} \rightarrow \texttt{same_as}<I>; \\
& \quad \};} \\
\end{align*}
\]

Let \( a \) and \( b \) be incrementable objects of type \( I \). \( I \) models \texttt{incrementable} only if

\begin{itemize}
  \item If \( \texttt{bool}(a == b) \) then \( \texttt{bool}(a++ == b) \).
  \item If \( \texttt{bool}(a == b) \) then \( \texttt{bool}(((\texttt{void})a++, \ a) == ++b) \).
\end{itemize}

[Note: The requirement that \( a \) equals \( b \) implies \( \texttt{++} a \) equals \( ++b \) (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model \texttt{incrementable}. — end note]

23.3.4.6 Concept \texttt{input_or_output_iterator} [iterator.concept.iterator]

The \texttt{input_or_output_iterator} concept forms the basis of the iterator concept taxonomy; every iterator models \texttt{input_or_output_iterator}. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (23.3.4.7), to read (23.3.4.9) or write (23.3.4.10) values, or to provide a richer set of iterator movements (23.3.4.11, 23.3.4.12, 23.3.4.13).

\[
\begin{align*}
\text{template<class I>} & \\
& \text{concept input_or_output_iterator =} \\
& \quad \text{requires(I i) \{ \\
& \quad \quad \{ *i \} \rightarrow \texttt{can-reference}; \\
& \quad \}} \\
& \quad \text{\&\&} \\
& \quad \text{weakly_incrementable}<I>; \\
\end{align*}
\]

[Note: Unlike the \texttt{Cpp17Iterator} requirements, the \texttt{input_or_output_iterator} concept does not require copyability. — end note]

23.3.4.7 Concept \texttt{sentinel_for} [iterator.concept.sentinel]

The \texttt{sentinel_for} concept specifies the relationship between an \texttt{input_or_output_iterator} type and a semiregular type whose values denote a range.
2 Let \( s \) and \( i \) be values of type \( S \) and \( I \) such that \([i, s)\) denotes a range. Types \( S \) and \( I \) model \( \text{sentry}_{\text{for}}\langle S, I \rangle \) only if

\[(1) \quad i == s \text{ is well-defined.}\]
\[(2) \quad \text{If } \text{bool}(i != s) \text{ then } i \text{ is dereferenceable and } [+i, s) \text{ denotes a range.}\]

3 The domain of \( == \) is not static. Given an iterator \( i \) and sentinel \( s \) such that \([i, s)\) denotes a range and \( i != s \), \( i \) and \( s \) are not required to continue to denote a range after incrementing any other iterator equal to \( i \). Consequently, \( i == s \) is no longer required to be well-defined.

23.3.4.8 Concept \text{sized}_{\text{sentinel}_{\text{for}}}

The \( \text{sentry}_{\text{for}} \) concept specifies requirements on an \( \text{input}_{\text{or}}\text{output}_{\text{iterator}} \) type \( I \) and a corresponding \( \text{sentry}_{\text{for}}\langle I \rangle \) that allow the use of the \( - \) operator to compute the distance between them in constant time.

Let \( i \) be an iterator of type \( I \), and \( s \) a sentinel of type \( S \) such that \([i, s)\) denotes a range. Let \( N \) be the smallest number of applications of \( +i \) necessary to make \( \text{bool}(i == s) \) be \( \text{true} \). \( S \) and \( I \) model \( \text{sentry}_{\text{for}}\langle S, I \rangle \) only if

\[(1) \quad \text{If } N \text{ is representable by } \text{iter}_{\text{difference}}\langle I \rangle, \text{ then } s - i \text{ is well-defined and equals } N.\]
\[(2) \quad \text{If } -N \text{ is representable by } \text{iter}_{\text{difference}}\langle I \rangle, \text{ then } i - s \text{ is well-defined and equals } -N.\]

3 Remarks: Pursuant to 16.5.4.2.1, users may specialize \( \text{disable}_{\text{sentry}_{\text{for}}} \) for cv-unqualified non-array object types \( S \) and \( I \) if \( S \) and/or \( I \) is a program-defined type. Such specializations shall be usable in constant expressions (7.7) and have type \text{const bool}.

4 [Note: \( \text{disable}_{\text{sentry}_{\text{for}}} \) allows use of sentinels and iterators with the library that satisfy but do not in fact model \( \text{sentry}_{\text{for}} \). — end note]

5 [Example: The \( \text{sentry}_{\text{for}} \) concept is modeled by pairs of \text{random}_{\text{access}_{\text{iterator}}} (23.3.4.13) and by counted iterators and their sentinels (23.5.6.1). — end example]

23.3.4.9 Concept \text{input}_{\text{iterator}}

The \( \text{input}_{\text{iterator}} \) concept defines requirements for a type whose referenced values can be read (from the requirement for \text{indirectly}_{\text{readable}} (23.3.4.2)) and which can be both pre- and post-incremented. [Note: Unlike the \text{Cpp17}_{\text{Input}_{\text{Iterator}}} requirements (23.3.5.2), the \( \text{input}_{\text{iterator}} \) concept does not need equality comparison since iterators are typically compared to sentinels. — end note]

```cpp
template<class S, class I>
concept input_iterator =
    input_or_output_iterator<I> &&
    indirectly_readable<I> &&
    requires { typename ITER_CONCEPT(I); } &&
    derived_from<ITER_CONCEPT(I), input_iterator_tag>;
```
23.3.4.10 Concept output_iterator

The output_iterator concept defines requirements for a type that can be used to write values (from the requirement for indirectly_writable (23.3.4.3)) and which can be both pre- and post-incremented. [Note: Output iterators are not required to model equality_comparable. — end note]

```cpp
template<class I, class T>
concept output_iterator =
    input_or_output_iterator<I> &&
    indirectly_writable<I, T> &&
    requires(I i, T&& t) {
        *i++ = std::forward<T>(t);  // not required to be equality-preserving
    };
```

Let E be an expression such that decltype((E)) is T, and let i be a dereferenceable object of type I. I and T model output_iterator<I, T> only if *i++ = E; has effects equivalent to:

- *i = E;
- ++i;

[Note: Algorithms on output iterators should never attempt to pass through the same iterator twice. They should be single-pass algorithms. — end note]

23.3.4.11 Concept forward_iterator

The forward_iterator concept adds copyability, equality comparison, and the multi-pass guarantee, specified below.

```cpp
template<class I>
concept forward_iterator =
    input_iterator<I> &&
    derived_from<ITER_CONCEPT(I), forward_iterator_tag> &&
    incrementable<I> &&
    sentinel_for<I, I>;
```

The domain of == for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type. [Note: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]

Pointers and references obtained from a forward iterator into a range [i, s) shall remain valid while [i, s) continues to denote a range.

Two dereferenceable iterators a and b of type X offer the multi-pass guarantee if:

(4.1)  
- a == b implies ++a == ++b and
(4.2)  
- The expression ((void []) (X x){++x;}(a), *a) is equivalent to the expression *a.

[Note: The requirement that a == b implies ++a == ++b and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators. — end note]

23.3.4.12 Concept bidirectional_iterator

The bidirectional_iterator concept adds the ability to move an iterator backward as well as forward.

```cpp
template<class I>
concept bidirectional_iterator =
    forward_iterator<I> &&
    derived_from<ITER_CONCEPT(I), bidirectional_iterator_tag> &&
    requires(I i) {
        { --i } -> same_as<I&>;
        { i-- } -> same_as<I>;
    };
```

A bidirectional iterator r is decrementable if and only if there exists some q such that ++q == r. Decrementable iterators r shall be in the domain of the expressions --r and r--.

Let a and b be equal objects of type I. I models bidirectional_iterator only if:

(3.1)  
- If a and b are decrementable, then all of the following are true:
(3.1.1)  
- addressof(--a) == addressof(a)
(3.1.2) — bool(a-- == b)
(3.1.3) — after evaluating both a-- and --b, bool(a == b) is still true
(3.1.4) — bool(++(--a) == b)
(3.2) — If a and b are incrementable, then bool(--(++a) == b).

23.3.4.13 Concept random_access_iterator

The random_access_iterator concept adds support for constant-time advancement with +=, +, -=, and −, as well as the computation of distance in constant time with −. Random access iterators also support array notation via subscripting.

```cpp
template<class I>
concept random_access_iterator =
    bidirectional_iterator<I> &&
    derived_from<ITER_CONCEPT(I), random_access_iterator_tag> &&
    totally_ordered<I> &&
    sized_sentinel_for<I, I> &&
    requires(I i, const I j, const iter_difference_t<I> n) {
        { i += n } -> same_as<I&>;
        { j + n } -> same_as<I>;
        { n + j } -> same_as<I>;
        { i -= n } -> same_as<I&>;
        { j - n } -> same_as<I>;
        { j[n] } -> same_as<iter_reference_t<I>>;
    };
```

2 Let a and b be valid iterators of type I such that b is reachable from a after n applications of ++a, let D be iter_difference_t<I>, and let n denote a value of type D. I models random_access_iterator only if

(2.1) — (a += n) is equal to b.
(2.2) — addressof(a += n) is equal to addressof(a).
(2.3) — (a + n) is equal to (a += n).
(2.4) — For any two positive values x and y of type D, if (a + D(x + y)) is valid, then (a + D(x + y)) is equal to ((a + x) + y).
(2.5) — (a + D(0)) is equal to a.
(2.6) — If (a + D(n − 1)) is valid, then (a + n) is equal to [](I c){ return ++c; }(a + D(n − 1)).
(2.7) — (b += D(−n)) is equal to a.
(2.8) — (b − n) is equal to a.
(2.9) — addressof(b − n) is equal to addressof(b).
(2.10) — (b − n) is equal to (b += n).
(2.11) — If b is dereferenceable, then a[n] is valid and is equal to *b.
(2.12) — bool(a <= b) is true.

23.3.4.14 Concept contiguous_iterator

The contiguous_iterator concept provides a guarantee that the denoted elements are stored contiguously in memory.

```cpp
template<class I>
concept contiguous_iterator =
    random_access_iterator<I> &&
    derived_from<ITER_CONCEPT(I), contiguous_iterator_tag> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<iter_value_t<I>, remove_cvref_t<iter_reference_t<I>>> &&
    requires(const I& i) {
        { to_address(i) } -> same_as<add_pointer_t<iter_reference_t<I>>>;
    };
```

2 Let a and b be dereferenceable iterators and c be a non-dereferenceable iterator of type I such that b is reachable from a and c is reachable from b, and let D be iter_difference_t<I>. The type I models contiguous_iterator only if

§ 23.3.4.14 ©ISO/IEC 2020 – All rights reserved 920
23.3.5 C++17 iterator requirements

In the following sections, a and b denote values of type X or const X, difference_type and reference refer to the types iterator_traits<X>::difference_type and iterator_traits<X>::reference, respectively, n denotes a value of difference_type, u, tmp, and m denote identifiers, r denotes a value of value type T, o denotes a value of some type that is writable to the output iterator. [Note: For an iterator type X there must be an instantiation of iterator_traits<X> (23.3.2.3). — end note]

23.3.5.1 Cpp17Iterator

The Cpp17Iterator requirements form the basis of the iterator taxonomy; every iterator meets the Cpp17Iterator requirements. This set of requirements specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to read (23.3.5.2) or write (23.3.5.3) values, or to provide a richer set of iterator movements (23.3.5.4, 23.3.5.5, 23.3.5.6).

A type X meets the Cpp17Iterator requirements if:

1. X meets the Cpp17CopyConstructible, Cpp17CopyAssignable, and Cpp17Destructible requirements (16.5.3.1) and lvalues of type X are swappable (16.5.3.2), and
2. iterator_traits<X>::difference_type is a signed integer type or void, and
3. the expressions in Table 84 are valid and have the indicated semantics.

Table 84: Cpp17Iterator requirements

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>*r</td>
<td>unspecified</td>
<td></td>
<td>Preconditions: r is dereferenceable.</td>
</tr>
<tr>
<td>++r</td>
<td>X&amp;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

23.3.5.2 Input iterators

A class or pointer type X meets the requirements of an input iterator for the value type T if X meets the Cpp17Iterator (23.3.5.1) and Cpp17EqualityComparable (Table 25) requirements and the expressions in Table 85 are valid and have the indicated semantics.

In Table 85, the term the domain of == is used in the ordinary mathematical sense to denote the set of values over which == is (required to be) defined. This set can change over time. Each algorithm places additional requirements on the domain of == for the iterator values it uses. These requirements can be inferred from the uses that algorithm makes of == and !=. [Example: The call find(a, b, x) is defined only if the value of a has the property p defined as follows: b has property p and a value i has property p if (*i==x) or if (*i!=x and ++i has property p). — end example]

Table 85: Cpp17InputIterator requirements (in addition to Cpp17Iterator)

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>a != b</td>
<td>contextually convertible to bool</td>
<td>!(a == b)</td>
<td>Preconditions: (a, b) is in the domain of ==.</td>
</tr>
<tr>
<td>*a</td>
<td>reference, convertible to T</td>
<td></td>
<td>Preconditions: a is dereferenceable. The expression (void)*a, *a is equivalent to *a. If a == b and (a, b) is in the domain of == then *a is equivalent to *b.</td>
</tr>
</tbody>
</table>
Table 85: `Cpp17InputIterator` requirements (in addition to `Cpp17Iterator`) (continued)

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td><code>++r</code></td>
<td><code>X&amp;</code></td>
<td></td>
<td>Preconditions: <code>r</code> is dereferenceable. Postconditions: <code>r</code> is dereferenceable or <code>r</code> is past-the-end; any copies of the previous value of <code>r</code> are no longer required to be dereferenceable nor to be in the domain of <code>==</code>.</td>
</tr>
<tr>
<td><code>(void)r++</code></td>
<td></td>
<td></td>
<td>equivalent to <code>(void)++r</code></td>
</tr>
<tr>
<td><code>*r++</code></td>
<td>convertible to <code>T</code></td>
<td><code>{ T tmp = *r; ++r; return tmp; }</code></td>
<td>Remarks: After this operation <code>r</code> is not required to be dereferenceable. Postconditions: <code>r</code> is incrementable.</td>
</tr>
</tbody>
</table>

3 [Note: For input iterators, `a == b` does not imply `++a == ++b`. (Equality does not guarantee the substitution property or referential transparency.) Algorithms on input iterators should never attempt to pass through the same iterator twice. They should be single pass algorithms. Value type `T` is not required to be a `Cpp17CopyAssignable` type (Table 31). These algorithms can be used with `istream` as the source of the input data through the `istream_iterator` class template. — end note]

23.3.5.3 Output iterators

A class or pointer type `X` meets the requirements of an output iterator if `X` meets the `Cpp17Iterator` requirements (23.3.5.1) and the expressions in Table 86 are valid and have the indicated semantics.

Table 86: `Cpp17OutputIterator` requirements (in addition to `Cpp17Iterator`) 

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>*r = o</code></td>
<td>result is not used</td>
<td></td>
<td>Remarks: After this operation <code>r</code> is not required to be dereferenceable. Postconditions: <code>r</code> is incrementable.</td>
</tr>
<tr>
<td><code>++r</code></td>
<td><code>X&amp;</code></td>
<td>addressof(r) == addressof(++r). Remarks: After this operation <code>r</code> is not required to be dereferenceable. Postconditions: <code>r</code> is incrementable.</td>
<td></td>
</tr>
<tr>
<td><code>r++</code></td>
<td>convertible to <code>X&amp;</code></td>
<td><code>{ X tmp = r; ++r; return tmp; }</code></td>
<td>Remarks: After this operation <code>r</code> is not required to be dereferenceable. Postconditions: <code>r</code> is incrementable.</td>
</tr>
<tr>
<td><code>*r++ = o</code></td>
<td>result is not used</td>
<td></td>
<td>Remarks: After this operation <code>r</code> is not required to be dereferenceable. Postconditions: <code>r</code> is incrementable.</td>
</tr>
</tbody>
</table>
2. \[Note: \] The only valid use of an `operator*` is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Algorithms on output iterators should never attempt to pass through the same iterator twice. They should be single-pass algorithms. Equality and inequality might not be defined. —end note]

23.3.5.4 Forward iterators

A class or pointer type `X` meets the requirements of a forward iterator if

1. `X` meets the `Cpp17InputIterator` requirements (23.3.5.2),
2. `X` meets the `Cpp17DefaultConstructible` requirements (16.5.3.1),
3. if `X` is a mutable iterator, `reference` is a reference to `T`; if `X` is a constant iterator, `reference` is a reference to `const T`,
4. the expressions in Table 87 are valid and have the indicated semantics, and
5. objects of type `X` offer the multi-pass guarantee, described below.

The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the same type. [Note: Value-initialized iterators behave as if they refer past the end of the same empty sequence. —end note]

3. Two dereferenceable iterators `a` and `b` of type `X` offer the multi-pass guarantee if:

1. `a == b` implies `++a == ++b` and
2. `X` is a pointer type or the expression `(void)++X(a), *a` is equivalent to the expression `*a`.

4. [Note: The requirement that `a == b` implies `++a == ++b` (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators. —end note]

Table 87: `Cpp17ForwardIterator` requirements (in addition to `Cpp17InputIterator`) [tab:forwarditerator]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r++</code></td>
<td>convertible to <code>X&amp;</code></td>
<td><code>{ X tmp = r; const X&amp; ++r; return tmp; }</code></td>
<td></td>
</tr>
<tr>
<td><code>*r++</code></td>
<td><code>reference</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5. If `a` and `b` are equal, then either `a` and `b` are both dereferenceable or else neither is dereferenceable.

6. If `a` and `b` are both dereferenceable, then `a == b` if and only if `*a` and `*b` are bound to the same object.

23.3.5.5 Bidirectional iterators

A class or pointer type `X` meets the requirements of a bidirectional iterator if, in addition to meeting the `Cpp17ForwardIterator` requirements, the following expressions are valid as shown in Table 88.

Table 88: `Cpp17BidirectionalIterator` requirements (in addition to `Cpp17ForwardIterator`) [tab:bidirectionaliterator]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--r</code></td>
<td><code>X&amp;</code></td>
<td><code>Preconditions: there exists s such that r == ++s.</code></td>
<td><code>Postconditions: r is dereferenceable. --(++r) == r. --r == --s implies r == s. addressof(r) == addressof(--r).</code></td>
</tr>
</tbody>
</table>
Table 88: Cpp17BidirectionalIterator requirements (in addition to Cpp17ForwardIterator) (continued)

<td>{ X tmp = r; --r; return tmp; }</td>
<td></td>
</tr>
<tr>
<td>*r--</td>
<td>reference</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2 [Note: Bidirectional iterators allow algorithms to move iterators backward as well as forward. — end note]

23.3.5.6 Random access iterators [random.access.iterators]

A class or pointer type X meets the requirements of a random access iterator if, in addition to meeting the Cpp17BidirectionalIterator requirements, the following expressions are valid as shown in Table 89.

Table 89: Cpp17RandomAccessIterator requirements (in addition to Cpp17BidirectionalIterator) [tab:randomaccessiterator]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>r += n</td>
<td>X&amp;</td>
<td>{ difference_type m = n; if (m &gt;= 0) while (m--) ++r; else while (m++) --r; return r; }</td>
<td>a + n == n + a.</td>
</tr>
<tr>
<td>a + n</td>
<td>X</td>
<td>{ X tmp = a; return tmp += n; }</td>
<td></td>
</tr>
<tr>
<td>n + a</td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>r -= n</td>
<td>X&amp;</td>
<td>return r -= -n;</td>
<td>Preconditions: the absolute value of n is in the range of representable values of difference_type.</td>
</tr>
<tr>
<td>a - n</td>
<td>X</td>
<td>{ X tmp = a; return tmp -= n; }</td>
<td></td>
</tr>
<tr>
<td>b - a</td>
<td>difference_-type</td>
<td>return n</td>
<td>Preconditions: there exists a value n of type difference_type such that a + n == b. b == a + (b - a).</td>

<td>b - a &gt; 0</td>
<td>&lt; is a total ordering relation</td>
</tr>
<tr>
<td>a &gt; b</td>
<td>contextually convertible to bool</td>
<td>b &lt; a</td>
<td>&gt; is a total ordering relation opposite to &lt;.</td>
</tr>
<tr>
<td>a &gt;= b</td>
<td>contextually convertible to bool</td>
<td>!(a &lt; b)</td>
<td></td>
</tr>
<tr>
<td>a &lt;= b</td>
<td>contextually convertible to bool</td>
<td>!(a &gt; b)</td>
<td></td>
</tr>
</tbody>
</table>
23.3.6 Indirect callable requirements

23.3.6.1 General

There are several concepts that group requirements of algorithms that take callable objects (20.14.2) as arguments.

23.3.6.2 Indirect callables

The indirect callable concepts are used to constrain those algorithms that accept callable objects (20.14.2) as arguments.

```cpp
namespace std {
    template<class F, class I>
    concept indirectly Unary invocable =
        indirectlyReadable<I> &&
        copyConstructible<F> &&
        invocable<F&, iter_value_t<I>&> &&
        invocable<F&, iter_reference_t<I>> &&
        invocable<F&, iter_common_reference_t<I>> &&
        common_reference_with<
            invoke_result_t<F&, iter_value_t<I>&>,
            invoke_result_t<F&, iter_reference_t<I>>;}

    template<class F, class I>
    concept indirectly Regular unary invocable =
        indirectlyReadable<I> &&
        copyConstructible<F> &&
        regularInvocable<F&, iter_value_t<I>&> &&
        regularInvocable<F&, iter_reference_t<I>> &&
        regularInvocable<F&, iter_common_reference_t<I>> &&
        common_reference_with<
            invoke_result_t<F&, iter_value_t<I>&>,
            invoke_result_t<F&, iter_reference_t<I>>;}

    template<class F, class I1, class I2>
    concept indirect Binary predicate =
        indirectlyReadable<I1> && indirectlyReadable<I2> &&
        copyConstructible<F> &&
        predicate<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
        predicate<F&, iter_value_t<I1>&, iter_reference_t<I2>> &&
        predicate<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
        predicate<F&, iter_reference_t<I1>, iter_reference_t<I2>> &&
        predicate<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;}

    template<class F, class I1, class I2 = I1>
    concept indirect equivalence Relation =
        indirectlyReadable<I1> && indirectlyReadable<I2> &&
        copyConstructible<F> &&
        equivalenceRelation<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
        equivalenceRelation<F&, iter_value_t<I1>&, iter_reference_t<I2>> &&
        equivalenceRelation<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
        equivalenceRelation<F&, iter_reference_t<I1>, iter_reference_t<I2>> &&
        equivalenceRelation<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;}
```
template<class F, class I1, class I2 = I1>
concept indirectly_strict_weak_order =
    indirectly_readable<I1> && indirectly_readable<I2> &&
    copy_constructible<F> &&
    strict_weak_order<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
    strict_weak_order<F&, iter_value_t<I1>&, iter_reference_t<I2>> &&
    strict_weak_order<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
    strict_weak_order<F&, iter_reference_t<I1>, iter_reference_t<I2>> &&
    strict_weak_order<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;

23.3.6.3 Class template projected

1 Class template projected is used to constrain algorithms that accept callable objects and projections (16.3.22). It combines a indirectly_readable type I and a callable object type Proj into a new indirectly_readable type whose reference type is the result of applying Proj to the iter_reference_t of I.

namespace std {
    template<indirectly_readable I, indirectly_regular_unary_invocable<I> Proj>
    struct projected {
        using value_type = remove_cvref_t<indirect_result_t<Proj&, I>>;
        indirect_result_t<Proj&, I> operator*() const; // not defined
    };
    template<weakly_incrementable I, class Proj>
    struct incrementable_traits<projected<I, Proj>> {
        using difference_type = iter_difference_t<I>;
    };
}

23.3.7 Common algorithm requirements

23.3.7.1 General

1 There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are three relational concepts that specify how element values are transferred between indirectly_readable and indirectly_writable types: indirectly_movable, indirectly_copyable, and indirectly_swappable. There are three relational concepts for rearrangements: permutable, mergeable, and sortable. There is one relational concept for comparing values from different sequences: indirectly_comparable.

2 [Note: The ranges::less function object type used in the concepts below imposes constraints on the concepts’ arguments in addition to those that appear in the concepts’ bodies (20.14.8). — end note]

23.3.7.2 Concept indirectly_movable

1 The indirectly_movable concept specifies the relationship between a indirectly_readable type and a indirectly_writable type between which values may be moved.

template<class In, class Out>
concept indirectly_movable =
    indirectly_readable<In> &&
    indirectly_writable<Out, iter_rvalue_reference_t<In>>;

2 The indirectly_movable_storable concept augments indirectly_movable with additional requirements enabling the transfer to be performed through an intermediate object of the indirectly_readable type’s value type.

template<class In, class Out>
concept indirectly_movable_storable =
    indirectly_movable<In, Out> &&
    indirectly_writable<Out, iter_value_t<In>> &&
    movable<iter_value_t<In>> &&
    constructible_from<iter_value_t<In>, iter_rvalue_reference_t<In>> &&
    assignable_from<iter_value_t<In>&, iter_rvalue_reference_t<In>>;

3 Let i be a dereferenceable value of type In. In and Out model indirectly_movable_storable<In, Out> only if after the initialization of the object obj in
iter_value_t<In> obj(ranges::iter_move(i));
obj is equal to the value previously denoted by *i. If iter_rvalue_reference_t<In> is an rvalue reference type, the resulting state of the value denoted by *i is valid but unspecified (16.5.5.16).

23.3.7.3 Concept indirectly_copyable

1 The indirectly_copyable concept specifies the relationship between a indirectly_readable type and a indirectly_writable type between which values may be copied.

```cpp
template<class In, class Out>
concept indirectly_copyable =
    indirectly_readable<In> &&
    indirectly_writable<Out, iter_reference_t<In>>;
```

2 The indirectly_copyable_storable concept augments indirectly_copyable with additional requirements enabling the transfer to be performed through an intermediate object of the indirectly_readable type’s value type. It also requires the capability to make copies of values.

```cpp
template<class In, class Out>
concept indirectly_copyable_storable =
    indirectly_copyable<In, Out> &&
    indirectly_writable<Out, iter_value_t<In>&> &&
    indirectly_writable<Out, const iter_value_t<In>&> &&
    indirectly_writable<Out, iter_value_t<In>&&> &&
    indirectly_writable<Out, const iter_value_t<In>&&> &&
    copyable<iter_value_t<In>> &&
    constructible_from<iter_value_t<In>, iter_reference_t<In>> &&
    assignable_from<iter_value_t<In>&, iter_reference_t<In>>;
```

3 Let i be a dereferenceable value of type In. In and Out model indirectly_copyable_storable<In, Out> only if after the initialization of the object obj in

```cpp
iter_value_t<In> obj(*i);
```

obj is equal to the value previously denoted by *i. If iter_reference_t<In> is an rvalue reference type, the resulting state of the value denoted by *i is valid but unspecified (16.5.5.16).

23.3.7.4 Concept indirectly_swappable

1 The indirectly_swappable concept specifies a swappable relationship between the values referenced by two indirectly_readable types.

```cpp
template<class I1, class I2 = I1>
concept indirectly_swappable =
    indirectly_readable<I1> && indirectly_readable<I2> &&
    requires(const I1 i1, const I2 i2) {
        ranges::iter_swap(i1, i1);
        ranges::iter_swap(i2, i2);
        ranges::iter_swap(i1, i2);
        ranges::iter_swap(i2, i1);
    };
```

23.3.7.5 Concept indirectly_comparable

1 The indirectly_comparable concept specifies the common requirements of algorithms that compare values from two different sequences.

```cpp
template<class I1, class I2, class R, class P1 = identity, class P2 = identity>
concept indirectly_comparable =
    indirect_binary_predicate<R, projected<I1, P1>, projected<I2, P2>>;
```

23.3.7.6 Concept permutable

1 The permutable concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

```cpp
template<class I>
concept permutable =
    forward_iterator<I> &&
    indirectly_movable_storable<I, I> &&
    indirectly_swappable<I, I>;
```
23.3.7.7 Concept mergeable

The `mergeable` concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

```cpp
template<class I1, class I2, class Out, class R = ranges::less,
          class P1 = identity, class P2 = identity>
concept mergeable =
    input_iterator<I1> &&
    input_iterator<I2> &&
    weakly_incrementable<Out> &&
    indirectly_copyable<I1, Out> &&
    indirectly_copyable<I2, Out> &&
    indirect_strict_weak_order<R, projected<I1, P1>, projected<I2, P2>>;
```

23.3.7.8 Concept sortable

The `sortable` concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., `sort`).

```cpp
template<class I, class R = ranges::less, class P = identity>
concept sortable =
    permutable<I> &&
    indirect_strict_weak_order<R, projected<I, P>>;
```

23.4 Iterator primitives

To simplify the use of iterators, the library provides several classes and functions.

23.4.1 Standard iterator tags

It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces `category tag` classes which are used as compile time tags for algorithm selection. They are: `output_iterator_tag`, `input_iterator_tag`, `forward_iterator_tag`, `bidirectional_iterator_tag`, `random_access_iterator_tag`, and `contiguous_iterator_tag`. For every iterator of type `I`, `iterator_traits<I>::iterator_category` shall be defined to be a category tag that describes the iterator’s behavior. Additionally, `iterator_traits<I>::iterator_concept` may be used to indicate conformance to the iterator concepts (23.3.4).

```cpp
namespace std {
    struct output_iterator_tag { }
    struct input_iterator_tag { }
    struct forward_iterator_tag: public input_iterator_tag { }
    struct bidirectional_iterator_tag: public forward_iterator_tag { }
    struct random_access_iterator_tag: public bidirectional_iterator_tag { }
    struct contiguous_iterator_tag: public random_access_iterator_tag { }
}
```

[Example: For a program-defined iterator `BinaryTreeIterator`, it could be included into the bidirectional iterator category by specializing the `iterator_traits` template:

```cpp
template<class T> struct iterator_traits<BinaryTreeIterator<T>> {
    using iterator_category = bidirectional_iterator_tag;
    using difference_type = ptrdiff_t;
    using value_type = T;
    using pointer = T*;
    using reference = T&;
};
```

—end example]

[Example: If `evolve()` is well-defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:

```cpp
template<class BidirectionalIterator>
inline void
evolve(BidirectionalIterator first, BidirectionalIterator last) {
    evolve(first, last,
          typename iterator_traits<BidirectionalIterator>::iterator_category());
}
Since only random access iterators provide + and − operators, the library provides two function templates advance and distance. These function templates use + and − for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use ++ to provide linear time implementations.

```cpp
template<class InputIterator, class Distance>
constexpr void advance(InputIterator& i, Distance n);
```

**Preconditions:** n is negative only for bidirectional iterators.

**Effects:** Increments i by n if n is non-negative, and decrements i by −n otherwise.

```cpp
template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last);
```

**Preconditions:** last is reachable from first, or InputIterator meets the Cpp17RandomAccessIterator requirements and first is reachable from last.

**Effects:** If InputIterator meets the Cpp17RandomAccessIterator requirements, returns (last − first); otherwise, returns the number of increments needed to get from first to last.

```cpp
template<class InputIterator>
constexpr InputIterator next(InputIterator x, typename iterator_traits<InputIterator>::difference_type n = 1);
```

**Effects:** Equivalent to: advance(x, n); return x;

```cpp
template<class BidirectionalIterator>
constexpr BidirectionalIterator prev(BidirectionalIterator x, typename iterator_traits<BidirectionalIterator>::difference_type n = 1);
```

**Effects:** Equivalent to: advance(x, −n); return x;

The library includes the function templates ranges::advance, ranges::distance, ranges::next, and ranges::prev to manipulate iterators. These operations adapt to the set of operators provided by each iterator category to provide the most efficient implementation possible for a concrete iterator type. [Example: ranges::advance uses the + operator to move a random_access_iterator forward n steps in constant time. For an iterator type that does not model random_access_iterator, ranges::advance instead performs n individual increments with the ++ operator. —end example]

The function templates defined in this subclause are not found by argument-dependent name lookup (6.5.2). When found by unqualified (6.5.1) name lookup for the postfix-expression in a function call (7.6.1.2), they inhibit argument-dependent name lookup.

[Example:
```cpp
void foo() {
    using namespace std::ranges;
    std::vector<int> vec{1,2,3};
```]
The function call expression at #1 invokes std::ranges::distance, not std::distance, despite that (a) the iterator type returned from begin(vec) and end(vec) may be associated with namespace std and (b) std::distance is more specialized (13.7.6.2) than std::ranges::distance since the former requires its first two parameters to have the same type.  —end example

The number and order of deducible template parameters for the function templates defined in this subclause is unspecified, except where explicitly stated otherwise.

23.4.3.1 ranges::advance

```
template<input_or_output_iterator I>
constexpr void ranges::advance(I& i, iter_difference_t<I> n);
```

1 Preconditions: If I does not model bidirectional_iterator, n is not negative.
2 Effects:
(2.1) — If I models random_access_iterator, equivalent to i += n.
(2.2) — Otherwise, if n is non-negative, increments i by n.
(2.3) — Otherwise, decrements i by -n.

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr void ranges::advance(I& i, S bound);
```
3 Preconditions: [i, bound) denotes a range.
4 Effects:
(4.1) — If I and S model assignable_from<I&, S>, equivalent to i = std::move(bound).
(4.2) — Otherwise, if S and I model sized_sentinel_for<S, I>, equivalent to ranges::advance(i, bound - i).
(4.3) — Otherwise, while bool(i != bound) is true, increments i.

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr iter_difference_t<I> ranges::advance(I& i, iter_difference_t<I> n, S bound);
```
5 Preconditions: If n > 0, [i, bound) denotes a range. If n == 0, [i, bound) or [bound, i) denotes a range. If n < 0, [bound, i) denotes a range, I models bidirectional_iterator, and I and S model same_as<I, S>.
6 Effects:
(6.1) — If S and I model sized_sentinel_for<S, I>:
(6.1.1) — If |n| ≥ |bound - i|, equivalent to ranges::advance(i, bound).
(6.1.2) — Otherwise, equivalent to ranges::advance(i, n).
(6.2) — Otherwise,
(6.2.1) — if n is non-negative, while bool(i != bound) is true, increments i but at most n times.
(6.2.2) — Otherwise, while bool(i != bound) is true, decrements i but at most -n times.
7 Returns: n - M, where M is the difference between the ending and starting positions of i.

23.4.3.2 ranges::distance

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr iter_difference_t<I> ranges::distance(I first, S last);
```
1 Preconditions: [first, last) denotes a range, or [last, first) denotes a range and S and I model same_as<S, I> && sized_sentinel_for<S, I>.
2 Effects: If S and I model sized_sentinel_for<S, I>, returns (last - first); otherwise, returns the number of increments needed to get from first to last.
template<range R>
    constexpr range_difference_t<R> ranges::distance(R&& r);

Effects:
If R models sized_range, equivalent to:
    return static_cast<range_difference_t<R>>(ranges::size(r));  // 24.3.9
Otherwise, equivalent to:
    return ranges::distance(ranges::begin(r), ranges::end(r));  // 24.3

23.4.3.3 ranges::next

template<input_or_output_iterator I>
    constexpr I ranges::next(I x);

Effects: Equivalent to: ++x; return x;

template<input_or_output_iterator I>
    constexpr I ranges::next(I x, iter_difference_t<I> n);

Effects: Equivalent to: ranges::advance(x, n); return x;

template<input_or_output_iterator I, sentinel_for<I> S>
    constexpr I ranges::next(I x, S bound);

Effects: Equivalent to: ranges::advance(x, bound); return x;

template<input_or_output_iterator I, sentinel_for<I> S>
    constexpr I ranges::next(I x, iter_difference_t<I> n, S bound);

Effects: Equivalent to: ranges::advance(x, n, bound); return x;

23.5.1 Reverse iterators

23.5.1.1 Class template reverse_iterator

namespace std {
    template<class Iterator>
    class reverse_iterator {
        public:
            using iterator_type = Iterator;
            using iterator_concept = see below;
            using iterator_category = see below;
            using value_type = iter_value_t<Iterator>;
            using difference_type = iter_difference_t<Iterator>;
            using pointer = typename iterator_traits<Iterator>::pointer;
            using reference = iter_reference_t<Iterator>;

3 23.5.1.1 © ISO/IEC 2020 – All rights reserved 931
constexpr reverse_iterator();
constexpr explicit reverse_iterator(Iterator x);
template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
template<class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

constexpr Iterator base() const;
constexpr reference operator*() const;
constexpr pointer operator->() const requires
{...
}

constexpr reverse_iterator& operator++();
constexpr reverse_iterator operator++(int);
constexpr reverse_iterator& operator--();
constexpr reverse_iterator operator--(int);

constexpr reverse_iterator operator+ (difference_type n) const;
constexpr reverse_iterator& operator+=(difference_type n);
constexpr reverse_iterator operator- (difference_type n) const;
constexpr reverse_iterator& operator-=(difference_type n);

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const reverse_iterator& i) noexcept(
{...
})
friend constexpr void
iter_swap(const reverse_iterator& x,
const reverse_iterator<Iterator2>& y) noexcept(
{...
});

protected:
Iterator current;
};

1 The member typedef-name iterator_concept denotes
— random_access_iterator_tag if Iterator models random_access_iterator, and
— bidirectional_iterator_tag otherwise.
2 The member typedef-name iterator_category denotes
— random_access_iterator_tag if the type iterator_traits<Iterator>::iterator_category models derived_from<random_access_iterator_tag>, and
— iterator_traits<Iterator>::iterator_category otherwise.

23.5.1.2 Requirements

1 The template parameter Iterator shall either meet the requirements of a Cpp17BidirectionalIterator (23.3.5.5) or model bidirectional_iterator (23.3.4.12).
2 Additionally, Iterator shall either meet the requirements of a Cpp17RandomAccessIterator (23.3.5.6) or model random_access_iterator (23.3.4.13) if the definitions of any of the members
— operator+, operator-, operator+=, operator-= (23.5.1.6), or
— operator[] (23.5.1.5),
or the non-member operators (23.5.1.7)
— operator<, operator>, operator<=, operator>=, operator-, or operator+ (23.5.1.8)
are instantiated (13.9.1).

23.5.1.3 Construction and assignment

constexpr reverse_iterator();

Effects: Value-initializes current. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type Iterator.
constexpr explicit reverse_iterator(Iterator x);

Effects: Initializes current with x.

template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);

Effects: Initializes current with u.current.

template<class U>
constexpr reverse_iterator&
operator=(const reverse_iterator<U>& u);

Effects: Assigns u.base() to current.

Returns: *this.

23.5.1.4 Conversion

constexpr Iterator base() const; // explicit

Returns: current.

23.5.1.5 Element access

constexpr reference operator*() const;

Effects: As if by:
Iterator tmp = current;
return *--tmp;

constexpr pointer operator->() const
requires (is_pointer_v<Iterator> ||
requires (const Iterator i) { i.operator->(); });

Effects:
(2.1) If Iterator is a pointer type, equivalent to: return prev(current);
(2.2) Otherwise, equivalent to: return prev(current).operator->();

constexpr unspecified operator[](difference_type n) const;

Returns: current[-n-1].

23.5.1.6 Navigation

constexpr reverse_iterator operator+(difference_type n) const;

Returns: reverse_iterator(current-n).

constexpr reverse_iterator operator-(difference_type n) const;

Returns: reverse_iterator(current+n).

constexpr reverse_iterator& operator++();

Effects: As if by: --current;

Returns: *this.

constexpr reverse_iterator& operator++(int);

Effects: As if by:
reverse_iterator tmp = *this;
--current;
return tmp;

constexpr reverse_iterator& operator--();

Effects: As if by ++current.

Returns: *this.
constexpr reverse_iterator operator--(int);

Effects: As if by:
reverse_iterator tmp = *this;
++current;
return tmp;

constexpr reverse_iterator& operator+=(difference_type n);

Effects: As if by: current -= n;
Returns: *this.

constexpr reverse_iterator& operator-=(difference_type n);

Effects: As if by: current += n;
Returns: *this.

23.5.1.7 Comparisons
[reverse.iter.cmp]

template<class Iterator1, class Iterator2>
constexpr bool operator==(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

Constraints: x.base() == y.base() is well-formed and convertible to bool.
Returns: x.base() == y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator!=(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

Constraints: x.base() != y.base() is well-formed and convertible to bool.
Returns: x.base() != y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator<(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

Constraints: x.base() < y.base() is well-formed and convertible to bool.
Returns: x.base() < y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator<=(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

Constraints: x.base() <= y.base() is well-formed and convertible to bool.
Returns: x.base() <= y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator>(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

Constraints: x.base() > y.base() is well-formed and convertible to bool.
Returns: x.base() > y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator>=(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

Constraints: x.base() >= y.base() is well-formed and convertible to bool.
Returns: x.base() >= y.base().
template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2>
operator<=>(const reverse_iterator<Iterator1>& x,
            const reverse_iterator<Iterator2>& y);

Returns: y.base() <=> x.base().

[Note: The argument order in the Returns: element is reversed because this is a reverse iterator. — end note]

23.5.1.8 Non-member functions

template<class Iterator1, class Iterator2>
constexpr auto operator-(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y)
    -> decltype(y.base() - x.base());

Returns: y.base() - x.base().

template<class Iterator>
constexpr reverse_iterator<Iterator> operator+(
    typename reverse_iterator<Iterator>::difference_type n,
    const reverse_iterator<Iterator>& x);

Returns: reverse_iterator<Iterator>(x.base() - n).

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const reverse_iterator& i) noexcept;

Effects: Equivalent to:
    auto tmp = i.base();
    return ranges::iter_move(--tmp);

Remarks: The expression in noexcept is equivalent to:
    is_nothrow_copy_constructible_v<Iterator> &&
    noexcept(ranges::iter_move(--declval<Iterator&>()))

friend constexpr void
iter_swap(const reverse_iterator& x,
          const reverse_iterator<Iterator2>& y) noexcept;

Effects: Equivalent to:
    auto xtmp = x.base();
    auto ytmp = y.base();
    ranges::iter_swap(--xtmp, --ytmp);

Remarks: The expression in noexcept is equivalent to:
    is_nothrow_copy_constructible_v<Iterator> &&
    is_nothrow_copy_constructible_v<Iterator2> &&
    noexcept(ranges::iter_swap(--declval<Iterator&>(), --declval<Iterator2&>()))

template<class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);

Returns: reverse_iterator<Iterator>(i).

23.5.2 Insert iterators

To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adapators, called insert iterators, are provided in the library. With regular iterator classes,

while (first != last) *result++ = *first++;

causes a range [first, last) to be copied into a range starting with result. The same code with result being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the insert mode instead of the regular overwrite mode.

An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators
meet the requirements of output iterators. operator* returns the insert iterator itself. The assignment
operator=(const T& x) is defined on insert iterators to allow writing into them, it inserts x right before
where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the
container where the insertion takes place. back_insert_iterator inserts elements at the end of a container,
front_insert_iterator inserts elements at the beginning of a container, and insert_iterator inserts
elements where the iterator points to in a container. back_inserter, front_inserter, and inserter are
three functions making the insert iterators out of a container.

23.5.2.1 Class template back_insert_iterator

```cpp
namespace std {

    template<class Container>
    class back_insert_iterator {

        protected:
            Container* container = nullptr;

        public:
            using iterator_category = output_iterator_tag;
            using value_type = void;
            using difference_type = ptrdiff_t;
            using pointer = void;
            using reference = void;
            using container_type = Container;

            constexpr back_insert_iterator() noexcept = default;
            constexpr explicit back_insert_iterator(Container& x);
            constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
            constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
            constexpr back_insert_iterator& operator*();
            constexpr back_insert_iterator& operator++();
            constexpr back_insert_iterator operator++(int);
    };
}
```

23.5.2.1.1 Operations

```cpp
constexpr explicit back_insert_iterator(Container& x);
```

1. **Effects:** Initializes container with addressof(x).

```cpp
constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
```

2. **Effects:** As if by: container->push_back(value);

3. **Returns:** *this.

```cpp
constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
```

4. **Effects:** As if by: container->push_back(std::move(value));

5. **Returns:** *this.

```cpp
constexpr back_insert_iterator& operator*();
```

6. **Returns:** *this.

```cpp
constexpr back_insert_iterator& operator++();
```

7. **Returns:** *this.

23.5.2.1.2 back_inserter

```cpp
template<class Container>
    constexpr back_insert_iterator<Container> back_inserter(Container& x);
```

1. **Returns:** back_insert_iterator<Container>(x).
23.5.2.2 Class template front_insert_iterator

namespace std {
    template<class Container>
    class front_insert_iterator {
    protected:
        Container* container = nullptr;

    public:
        using iterator_category = output_iterator_tag;
        using value_type = void;
        using difference_type = ptrdiff_t;
        using pointer = void;
        using reference = void;
        using container_type = Container;

        constexpr front_insert_iterator() noexcept = default;
        constexpr explicit front_insert_iterator(Container& x);
        constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
        constexpr front_insert_iterator& operator=(typename Container::value_type&& value);
        constexpr front_insert_iterator& operator*();
        constexpr front_insert_iterator& operator++();
        constexpr front_insert_iterator operator++(int);
    };
}

23.5.2.2.1 Operations

constexpr explicit front_insert_iterator(Container& x);

1  Effects: Initializes container with addressof(x).

constexpr front_insert_iterator& operator=(const typename Container::value_type& value);

2  Effects: As if by: container->push_front(value);
3  Returns: *this.

constexpr front_insert_iterator& operator=(typename Container::value_type&& value);

4  Effects: As if by: container->push_front(std::move(value));
5  Returns: *this.

constexpr front_insert_iterator& operator*();

6  Returns: *this.

constexpr front_insert_iterator& operator++();
7  constexpr front_insert_iterator operator++(int);

23.5.2.2.2 front_inserter

template<class Container>
    constexpr front_insert_iterator<Container> front_inserter(Container& x);

1  Returns: front_insert_iterator<Container>(x).

23.5.2.3 Class template insert_iterator

namespace std {
    template<class Container>
    class insert_iterator {
    protected:
        Container* container = nullptr;
        ranges::iterator_t<Container> iter = ranges::iterator_t<Container>();

    };
}
public:
  using iterator_category = output_iterator_tag;
  using value_type = void;
  using difference_type = ptrdiff_t;
  using pointer = void;
  using reference = void;
  using container_type = Container;

insert_iterator() = default;
constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
constexpr insert_iterator& operator=(const typename Container::value_type& value);
constexpr insert_iterator& operator=(typename Container::value_type&& value);
constexpr insert_iterator& operator*();
constexpr insert_iterator& operator++();
constexpr insert_iterator& operator++(int);
};

23.5.2.3.1 Operations

constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
Effects: Initializes container with addressof(x) and iter with i.

constexpr insert_iterator& operator=(const typename Container::value_type& value);
Effects: As if by:
  iter = container->insert(iter, value);
  ++iter;
Returns: *this.

constexpr insert_iterator& operator=(typename Container::value_type&& value);
Effects: As if by:
  iter = container->insert(iter, std::move(value));
  ++iter;
Returns: *this.

constexpr insert_iterator& operator*();
Returns: *this.

constexpr insert_iterator& operator++();
constexpr insert_iterator& operator++(int);
Returns: *this.

23.5.2.3.2 inserter

template<class Container>
constexpr insert_iterator<Container>
inserter(Container& x, ranges::iterator_t<Container> i);
Returns: inserter(x, i).

23.5.3 Move iterators and sentinels

Class template move_iterator is an iterator adaptor with the same behavior as the underlying iterator except that its indirect operator implicitly converts the value returned by the underlying iterator's indirect operator to an rvalue. Some generic algorithms can be called with move iterators to replace copying with moving.

Example:
list<string> s;
// populate the list
vector<string> v1(s.begin(), s.end()); // copies strings into v1
vector<string> v2(make_move_iterator(s.begin()),
    make_move_iterator(s.end()));  // moves strings into v2

/* end example */

23.5.3.1 Class template move_iterator

namespace std {
    template<class Iterator>
    class move_iterator {
        public:
            using iterator_type = Iterator;
            using iterator_concept = input_iterator_tag;
            using iterator_category = see below;
            using value_type = iter_value_t<Iterator>;
            using difference_type = iter_difference_t<Iterator>;
            using pointer = Iterator;
            using reference = iter_rvalue_reference_t<Iterator>;

            constexpr move_iterator();
            constexpr explicit move_iterator(Iterator i);
            template<class U> constexpr move_iterator(const move_iterator<U>& u);
            template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

            constexpr iterator_type base() const &;
            constexpr iterator_type base() &&;
            constexpr reference operator*() const;

            constexpr move_iterator& operator++();
            constexpr auto operator++(int);
            constexpr move_iterator& operator--();
            constexpr move_iterator operator--(int);
            constexpr move_iterator operator+(difference_type n) const;
            constexpr move_iterator& operator+=(difference_type n);
            constexpr move_iterator operator-(difference_type n) const;
            constexpr move_iterator& operator-=(difference_type n);
            constexpr reference operator[](difference_type n) const;

            template<sentinel_for<Iterator> S>
                friend constexpr bool
                operator==(const move_iterator& x, const move_sentinel<S>& y);
            template<sized_sentinel_for<Iterator> S>
                friend constexpr iter_difference_t<Iterator>
                operator-(const move_sentinel<S>& x, const move_iterator& y);

            friend constexpr iter_rvalue_reference_t<Iterator>
                iter_move(const move_iterator& i)
                noexcept(noexcept(ranges::iter_move(i.current)));
            template<indirectly_swappable<Iterator> Iterator2>
                friend constexpr void
                iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
                noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

        private:
            Iterator current;  // exposition only
        }; 
    }

1 The member typedef-name iterator_category denotes
    — random_access_iterator_tag if the type iterator_traits<Iterator>::iterator_category models
    derived_from<random_access_iterator_tag>, and
    — iterator_traits<Iterator>::iterator_category otherwise.
23.5.3.2 Requirements

The template parameter `Iterator` shall either meet the `Cpp17InputIterator` requirements (23.3.5.2) or model `input_iterator` (23.3.4.9). Additionally, if any of the bidirectional traversal functions are instantiated, the template parameter shall either meet the `Cpp17BidirectionalIterator` requirements (23.3.5.5) or model `bidirectional_iterator` (23.3.4.12). If any of the random access traversal functions are instantiated, the template parameter shall either meet the `Cpp17RandomAccessIterator` requirements (23.3.5.6) or model `random_access_iterator` (23.3.4.13).

23.5.3.3 Construction and assignment

```cpp
constexpr move_iterator();
```

**Effects:** Constructs a `move_iterator`, value-initializing `current`. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type `Iterator`.

```cpp
constexpr explicit move_iterator(Iterator i);
```

**Effects:** Constructs a `move_iterator`, initializing `current` with `std::move(i)`.

```cpp
template<class U> constexpr move_iterator(const move_iterator<U>& u);
```

**Mandates:** `U` is convertible to `Iterator`.

**Effects:** Constructs a `move_iterator`, initializing `current` with `u.base()`.

```cpp
template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);
```

**Mandates:** `U` is convertible to `Iterator`.

**Effects:** Assigns `u.base()` to `current`.

23.5.3.4 Conversion

```cpp
constexpr Iterator base() const &;
```

**Constraints:** `Iterator` satisfies `copy_constructible`.

**Preconditions:** `Iterator` models `copy_constructible`.

**Returns:** `current`.

```cpp
constexpr Iterator base() &&;
```

**Returns:** `std::move(current)`.

23.5.3.5 Element access

```cpp
constexpr reference operator*() const;
```

**Effects:** Equivalent to: `return ranges::iter_move(current);`

```cpp
constexpr reference operator[](difference_type n) const;
```

**Effects:** Equivalent to: `ranges::iter_move(current + n);`

23.5.3.6 Navigation

```cpp
constexpr move_iterator& operator++();
```

**Effects:** As if by `++current`.

**Returns:** `*this`.

```cpp
constexpr auto operator++(int);
```

**Effects:** If `Iterator` models `forward_iterator`, equivalent to:

- `move_iterator tmp = *this;`  
- `++current;`  
- `return tmp;`  

Otherwise, equivalent to `++current`.

§ 23.5.3.6 ©ISO/IEC 2020 – All rights reserved 940
constexpr move_iterator& operator--();

   Effects: As if by --current.

   Returns: *this.

castexpr move_iterator operator--(int);

   Effects: As if by:
       move_iterator tmp = *this;
       --current;
       return tmp;

constexpr move_iterator operator+(difference_type n) const;

   Returns: move_iterator(current + n).

constexpr move_iterator& operator+=(difference_type n);

   Effects: As if by:
       current += n;

   Returns: *this.

constexpr move_iterator operator-(difference_type n) const;

   Returns: move_iterator(current - n).

constexpr move_iterator& operator-=(difference_type n);

   Effects: As if by: current -= n;

23.5.3.7 Comparisons

template<class Iterator1, class Iterator2>
constexpr bool operator==(const move_iterator<Iterator1>& x,
 const move_iterator<Iterator2>& y);

template<sentinel_for<Iterator> S>
friend constexpr bool operator==(const move_iterator& x,
 const move_sentinel<S>& y);

   Constraints: x.base() == y.base() is well-formed and convertible to bool.

   Returns: x.base() == y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

   Constraints: x.base() < y.base() is well-formed and convertible to bool.

   Returns: x.base() < y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator>(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

   Constraints: y.base() < x.base() is well-formed and convertible to bool.

   Returns: y < x.

template<class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

   Constraints: y.base() < x.base() is well-formed and convertible to bool.

   Returns: !(y < x).

template<class Iterator1, class Iterator2>
constexpr bool operator>=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

   Constraints: x.base() < y.base() is well-formed and convertible to bool.

   Returns: !(x < y).
template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2>
operator<=>(const move_iterator<Iterator1>& x,
            const move_iterator<Iterator2>& y);

Returns: x.base() <=> y.base().

### 23.5.3.8 Non-member functions

```cpp
template<class Iterator1, class Iterator2>
constexpr auto operator-(const move_iterator<Iterator1>& x,
                        const move_iterator<Iterator2>& y)
-> decltype(x.base() - y.base());

template<sized_sentinel_for<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_sentinel<S>& x, const move_iterator& y);

template<sized_sentinel_for<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_iterator& x, const move_sentinel<S>& y);
```

Returns: x.base() - y.base.

```cpp
template<class Iterator>
constexpr move_iterator<Iterator>
operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator>& x);

Constraints: x + n is well-formed and has type Iterator.

Returns: x + n.
```

```cpp
friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const move_iterator& i)
noexcept(noexcept(ranges::iter_move(i.current)));

Effects: Equivalent to: return ranges::iter_move(i.current);
```

```cpp
template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

Effects: Equivalent to: ranges::iter_swap(x.current, y.current).
```

```cpp
template<class Iterator>
constexpr move_iterator<Iterator> make_move_iterator(Iterator i);

Returns: move_iterator<Iterator>(std::move(i)).
```

### 23.5.3.9 Class template move_sentinel

**Example:** A move_if algorithm is easily implemented with copy_if using move_iterator and move_sentinel:

```cpp
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
         indirect_unary_predicate<I> Pred>
requires indirectly_movable<I, O>
void move_if(I first, S last, O out, Pred pred) {
    std::ranges::copy_if(move_iterator<I>{first}, move_sentinel<S>{last}, out, pred);
}
```

namespace std {
    template<semiregular S>
    class move_sentinel {
        public:
            constexpr move_sentinel();
    }
}

§ 23.5.3.9 ©ISO/IEC 2020 – All rights reserved 942
constexpr explicit move_sentinel(S s);

```cpp
template<class S2>
  requires convertible_to<const S2&, S>
  constexpr move_sentinel(const move_sentinel<S2>& s);
```

```cpp
template<class S2>
  requires assignable_from<S&, const S2&>
  constexpr move_sentinel& operator=(const move_sentinel<S2>& s);
```

```cpp
constexpr S base() const;
```
constexpr common_iterator() = default;
constexpr common_iterator(I i);
constexpr common_iterator(S s);
template<class I2, class S2>
  requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
  constexpr common_iterator(const common_iterator<I2, S2>& x);

template<class I2, class S2>
  requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
    assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
  common_iterator& operator=(const common_iterator<I2, S2>& x);

decltype(auto) operator*();
decltype(auto) operator*() const
  requires dereferenceable<const I>;
decltype(auto) operator->() const
  requires see below;

common_iterator& operator++();
decltype(auto) operator++(int);

template<class I2, sentinel_for<I> S2>
  friend bool operator==(
    const common_iterator& x, const common_iterator<I2, S2>& y);

template<class I2, sentinel_for<I> S2>
  requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
  friend bool operator==(
    const common_iterator& x, const common_iterator<I2, S2>& y);

template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
  requires sized_sentinel_for<S, I2>
  friend iter_difference_t<I2> operator-(
    const common_iterator& x, const common_iterator<I2, S2>& y);

friend iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
  noexcept(noexcept(ranges::iter_move(declval<const I&>())))
    requires input_iterator<I>;
template<indirectly_swappable<I> I2, class S2>
  friend void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
    noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())))
;
private:
  variant<I, S> v_;  // exposition only
};

template<class I, class S>
struct incrementable_traits<common_iterator<I, S>> {
  using difference_type = iter_difference_t<I>;
};

template<input_iterator I, class S>
struct iterator_traits<common_iterator<I, S>> {
  using iterator_concept = see below;
  using iterator_category = see below;
  using value_type = iter_value_t<I>;
  using difference_type = iter_difference_t<I>;
  using pointer = see below;
  using reference = iter_reference_t<I>;
};
23.5.4.2 Associated types

The nested typedef-names of the specialization of iterator_traits for common_iterator<I, S> are defined as follows.

- (1.1) iterator_concept denotes forward_iterator_tag if I models forward_iterator; otherwise it denotes input_iterator_tag.
- (1.2) iterator_category denotes forward_iterator_tag if iterator_traits<I>::iterator_category models derived_from<forward_iterator_tag>; otherwise it denotes input_iterator_tag.
- (1.3) If the expression a.operator->() is well-formed, where a is an lvalue of type const common_iterator<I, S>, then pointer denotes the type of that expression. Otherwise, pointer denotes void.

23.5.4.3 Constructors and conversions

constexpr common_iterator(I i);

Effects: Initializes v_ as if by 
v_{in_place_type<I>, std::move(i)}.

constexpr common_iterator(S s);

Effects: Initializes v_ as if by 
v_{in_place_type<S>, std::move(s)}.

template<class I2, class S2>
requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
constexpr common_iterator(const common_iterator<I2, S2>& x);

Preconditions: x.v_.valueless_by_exception() is false.

Effects: Initializes v_ as if by 
v_{in_place_index<i>, get<i>(x.v_)}, where i is x.v_.index().

template<class I2, class S2>
requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
common_iterator& operator=(const common_iterator<I2, S2>& x);

Preconditions: x.v_.valueless_by_exception() is false.

Effects: Equivalent to:

(6.1) If v_.index() == x.v_.index(), then get<i>(v_) = get<i>(x.v_).
(6.2) Otherwise, v_.emplace<i>(get<i>(x.v_)).

where i is x.v_.index().

Returns: *this

23.5.4.4 Accessors

decltype(auto) operator*();

decltype(auto) operator*() const
requires dereferenceable<const I>;

Preconditions: holds_alternative<I>(v_).

Effects: Equivalent to: return *get<I>(v_);

decaytype(auto) operator->() const
requires see below;

The expression in the requires clause is equivalent to:

indirectly_readable<const I> &&
( requires(const I& i) { i.operator->(); } ||
is_reference_v<iter_reference_t<I>> ||
constructible_from<iter_value_t<I>, iter_reference_t<I>>)

Preconditions: holds_alternative<I>(v_).

Effects:

(5.1) If I is a pointer type or if the expression get<I>(v_).operator->() is well-formed, equivalent to: return get<I>(v_);
— Otherwise, if iter_reference_t<!> is a reference type, equivalent to:
  auto&& tmp = *get<!>(v_);
  return addressof(tmp);
— Otherwise, equivalent to: return proxy(*get<!>(v_)); where proxy is the exposition-only class:

```cpp
class proxy {
  iter_value_t<!> keep_; 
  proxy(iter_reference_t<!>&& x) : keep_(std::move(x)) {} 
public: 
  const iter_value_t<!>* operator->() const { 
    return addressof(keep_); 
  }
};
```

23.5.4.5 Navigation [common.iter.nav]

```cpp
common_iterator& operator++();
```

1 Preconditions: holds_alternative<!>(v_).

2 Effects: Equivalent to ++get<!>(v_).

3 Returns: *this.

decltype(auto) operator++(int);

1 Preconditions: holds_alternative<!>(v_).

2 Effects: If I models forward_iterator, equivalent to:

   common_iterator tmp = *this;
   ***this;
   return tmp;

   Otherwise, equivalent to: return get<!>(v_)++;

23.5.4.6 Comparisons [common.iter.cmp]

```cpp
template<class I2, sentinel_for<I> S2> 
requires sentinel_for<S, I2>
friend bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
```

1 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.

2 Returns: true if i == j, and otherwise get<!>(x.v_) == get<!>(y.v_), where i is x.v_.index() and j is y.v_.index().

```cpp
template<class I2, sentinel_for<I> S2> 
requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
friend bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
```

3 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.

4 Returns: true if i and j are each 1, and otherwise get<!>(x.v_) == get<!>(y.v_), where i is x.v_.index() and j is y.v_.index().

```cpp
template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2> 
requires sized_sentinel_for<S, I2>
friend iter_difference_t<I2> operator-(const common_iterator& x, const common_iterator<I2, S2>& y);
```

5 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
6 Returns: 0 if \( i \) and \( j \) are each 1, and otherwise \( \text{get}<i>(x.v_.) - \text{get}<j>(y.v_.) \), where \( i \) is \( x.v_.\text{index}() \) and \( j \) is \( y.v_.\text{index}() \).

### 23.5.4.7 Customization

friend iter
\text{rvalue_reference} \text{t<}I> \text{iter}_\text{move}(\text{const} \text{common_iterator}& i)
\text{ noexcept(noexcept(ranges::iter_move(declval<const I&>()))))}
\text{ requires input_iterator<}I>;

1 \text{ Preconditions:}\ \text{holds_alternative<}I>(v_.)

2 \text{ Effects:} Equivalent to: \text{return ranges::iter_move(get<}I>(i.v_.));

### 23.5.5 Default sentinels

\text{namespace std {}
\text{struct default_sentinel_t { };}
\text{}}

1 Class \text{default_sentinel_t} is an empty type used to denote the end of a range. It can be used together with iterator types that know the bound of their range (e.g., \text{counted_iterator} (23.5.6.1)).

### 23.5.6 Counted iterators

#### 23.5.6.1 Class template \text{counted_iterator}

1 Class template \text{counted_iterator} is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of the distance to the end of its range. It can be used together with \text{default_sentinel} in calls to generic algorithms to operate on a range of \( N \) elements starting at a given position without needing to know the end position a priori.

2 \text{[Example:}
\begin{verbatim}
list<string> s;
// populate the list s with at least 10 strings
vector<string> v;
// copies 10 strings into v:
ranges::copy(counted_iterator(s.begin(), 10), default_sentinel, back_inserter(v));
\end{verbatim}
\text{—end example]}

3 Two values \( i_1 \) and \( i_2 \) of types \text{counted_iterator<}I_1> \text{and} \text{counted_iterator<}I_2> \text{refer to elements of the same sequence if and only if next(}i_1\text{.base()}, \text{i1}\text{.count()} \text{and next(}i_2\text{.base()}, \text{i2}\text{.count()} \text{refer to the same (possibly past-the-end) element.}

\text{namespace std {}
\text{template<input_or_output_iterator I>}
\text{class counted_iterator {}
\text{ public:}
\text{ using iterator_type = I;}

\text{constexpr counted_iterator() = default;}
\text{constexpr counted_iterator(I x, iter_difference_t<}I> n);}
\text{template<class I2>}
\text{ requires convertible_to<const I2&, I>}
\text{ constexpr counted_iterator(const counted_iterator<}I2>& x);}
\text{template<class I2>}
\text{ requires assignable_from<I&, const I2&>}
\text{ constexpr counted_iterator& operator=(const counted_iterator<}I2>& x);}

\text{}}

};

23.5.6.2 Constructors and conversions

constexpr counted_iterator(I i, iter_difference_t<I> n);

1 Preconditions: n >= 0.
2 Effects: Initializes current with std::move(i) and length with n.

template<class I2>
requires convertible_to<const I2&, I>
constexpr counted_iterator(const counted_iterator<I2>& x);
3 Effects: Initializes current with x.current and length with x.length.

template<class I2>
requires assignable_from<I&, const I2&>
constexpr counted_iterator& operator=(const counted_iterator<I2>& x);
4 Effects: Assigns x.current to current and x.length to length.
5 Returns: *this.

23.5.6.3 Accessors

constexpr I base() const & requires copy_constructible<I>;
1 Effects: Equivalent to: return current;
2 base() &&;
3 Returns: std::move(current).

constexpr iter_difference_t<I> count() const noexcept;
3 Effects: Equivalent to: return length;

23.5.6.4 Element access

constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
  requires dereferenceable<const I>;
1 Effects: Equivalent to: return *current;

constexpr decltype(auto) operator[](iter_difference_t<I> n) const
  requires random_access_iterator<I>;
2 Preconditions: n < length.
3 Effects: Equivalent to: return current[n];

23.5.6.5 Navigation

constexpr counted_iterator& operator++();
1 Preconditions: length > 0.
2 Effects: Equivalent to:
   ++current;
   --length;
   return *this;
decltype(auto) operator++(int);

**Preconditions:** length > 0.

**Effects:** Equivalent to:
- \(--\text{length};
- \{ \text{return current++; } \}
- \{ \text{++\text{length}; throw; } \}

\text{constexpr counted_iterator operator++(int)}
\text{requires forward_iterator}<I>;

**Effects:** Equivalent to:
- \(\text{counted_iterator tmp = *this;}
- \{ \text{++\text{this;}} \}
- \text{return tmp;}

\text{constexpr counted_iterator\& operator--()}\text{requires bidirectional_iterator}<I>;

**Effects:** Equivalent to:
- \(--\text{current;}
- \{ \text{++\text{length;}} \}
- \text{return *this;}

\text{constexpr counted_iterator operator--(int)}\text{requires bidirectional_iterator}<I>;

**Effects:** Equivalent to:
- \(\text{counted_iterator tmp = *this;}
- \{ \text{--\text{this;}} \}
- \text{return tmp;}

\text{constexpr counted_iterator operator+(iter_difference_t<I> n) const}
\text{requires random_access_iterator}<I>;

**Effects:** Equivalent to: \(\text{return counted_iterator(current + n, length - n);}

\text{friend constexpr counted_iterator operator+(}
\text{iter_difference_t<I> n, const counted_iterator\& x)}
\text{requires random_access_iterator}<I>;

**Effects:** Equivalent to: \(\text{return x + n;}

\text{constexpr counted_iterator\& operator+=(iter_difference_t<I> n)}\text{const}
\text{requires random_access_iterator}<I>;

**Preconditions:** \(n \leq \text{length.}

**Effects:** Equivalent to:
- \(\text{current += n;}
- \text{length -= n;}
- \text{return *\text{this;}}

\text{constexpr counted_iterator operator-(iter_difference_t<I> n) const}
\text{requires random_access_iterator}<I>;

**Effects:** Equivalent to: \(\text{return counted_iterator(current - n, length + n);}

\text{template<common_with<I> I2>}
\text{friend constexpr iter_difference_t<I2> operator-}(
\text{const counted_iterator\& x, const counted_iterator<I2\& y);}

**Preconditions:** \(x \text{ and } y \text{ refer to elements of the same sequence (23.5.6.1).}

**Effects:** Equivalent to: \(\text{return y.length - x.length;}

\text{friend constexpr iter_difference_t<I> operator-}(
\text{const counted_iterator\& x, default_sentinel_t});

**Effects:** Equivalent to: \(\text{return }-\text{x.length;}

\text{§ 23.5.6.5}
friend constexpr iter_difference_t<I> operator-(
  default_sentinel_t, const counted_iterator& y);

Effects: Equivalent to: return y.length;

constexpr counted_iterator& operator-=(iter_difference_t<I> n)
requires random_access_iterator<I>;

Preconditions: -n <= length.

Effects: Equivalent to:
current -= n;
length += n;
return *this;

23.5.6.6 Comparisons

template<common_with<I> I2>
friend constexpr bool operator==(const counted_iterator& x, const counted_iterator<I2>& y);

Preconditions: x and y refer to elements of the same sequence (23.5.6.1).

Effects: Equivalent to: return x.length == y.length;

friend constexpr bool operator==(const counted_iterator& x, default_sentinel_t);

Effects: Equivalent to: return x.length == 0;

template<common_with<I> I2>
friend constexpr strong_ordering operator<=>(const counted_iterator& x, const counted_iterator<I2>& y);

Preconditions: x and y refer to elements of the same sequence (23.5.6.1).

Effects: Equivalent to: return y.length <=> x.length;

[Note: The argument order in the Effects: element is reversed because length counts down, not up.
—end note]

23.5.6.7 Customizations

friend constexpr iter_rvalue_reference_t<I>
  iter_move(const counted_iterator& i)
  noexcept(noexcept(ranges::iter_move(i.current)))
requires input_iterator<I>;

Effects: Equivalent to: return ranges::iter_move(i.current);

template<indirectly_swappable<I> I2>
friend constexpr void
  iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
  noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

Effects: Equivalent to ranges::iter_swap(x.current, y.current).

23.5.7 Unreachable sentinel

Class unreachable_sentinel_t

Class unreachable_sentinel_t can be used with any weakly_incrementable type to denote the “upper bound” of an unbounded interval.

[Example:
  char* p;
  // set p to point to a character buffer containing newlines
  char* ml = find(p, unreachable_sentinel, '\n');

  Provided a newline character really exists in the buffer, the use of unreachable_sentinel above potentially makes the call to find more efficient since the loop test against the sentinel does not require a conditional branch. —end example]
namespace std {
struct unreachable_sentinel_t {
    template<weakly_incrementable I>
    friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept
    { return false; }
};
}

23.6 Stream iterators

To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

[Example:
partial_sum(istream_iterator<double, char>(cin),
    istream_iterator<double, char>(),
    ostream_iterator<double, char>(cout, "\n"));
reads a file containing floating-point numbers from cin, and prints the partial sums onto cout. — end example]

23.6.1 Class template istream_iterator

The class template istream_iterator is an input iterator (23.3.5.2) that reads successive elements from the input stream for which it was constructed.

namespace std {
    template<class T, class charT = char, class traits = char_traits<charT>, class Distance = ptrdiff_t>
    class istream_iterator {
    public:
        using iterator_category = input_iterator_tag;
        using value_type = T;
        using difference_type = Distance;
        using pointer = const T*;
        using reference = const T&;
        using char_type = charT;
        using traits_type = traits;
        using istream_type = basic_istream<charT,traits>;
        constexpr istream_iterator();
        constexpr istream_iterator(default_sentinel_t);
        istream_iterator(istream_type& s);
        istream_iterator(const istream_iterator& x) = default;
        ~istream_iterator() = default;
        istream_iterator& operator=(const istream_iterator&);
        const T& operator*() const;
        const T* operator->() const;
        istream_iterator& operator++();
        istream_iterator operator++(int);
    friend bool operator==(const istream_iterator& i, default_sentinel_t);
    private:
        basic_istream<charT,traits>* in_stream; // exposition only
        T value; // exposition only
    }
}

2 The type T shall meet the Cpp17DefaultConstructible, Cpp17CopyConstructible, and Cpp17CopyAssignable requirements.

23.6.1.1 Constructors and destructor

constexpr istream_iterator();
constexpr istream_iterator(default_sentinel_t);

Effects: Constructs the end-of-stream iterator, value-initializing value.

Postconditions: in_stream == nullptr is true.

Remarks: If the initializer T() in the declaration auto x = T(); is a constant initializer (7.7), then these constructors are constexpr constructors.

istream_iterator(istream_type& s);

Effects: Initializes in_stream with addressof(s), value-initializes value, and then calls operator++().

const T& operator*() const;

Preconditions: in_stream != nullptr is true.

Returns: value.

const T* operator->() const;

Preconditions: in_stream != nullptr is true.

Returns: addressof(value).

istream_iterator& operator++();

Preconditions: in_stream != nullptr is true.

Effects: Equivalent to:

if (!(*in_stream >> value))
in_stream = nullptr;

Returns: *this.

istream_iterator operator++(int);

Preconditions: in_stream != nullptr is true.

Effects: Equivalent to:

istream_iterator tmp = *this;
++*this;
return tmp;

template<class T, class charT, class traits, class Distance>
bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
const istream_iterator<T,charT,traits,Distance>& y);

Returns: x.in_stream == y.in_stream.

friend bool operator==(const istream_iterator& i, default_sentinel_t);

Returns: !i.in_stream.

23.6.2 Class template ostream_iterator

ostream_iterator writes (using operator<<) successive elements onto the output stream from which it was constructed. If it was constructed with charT* as a constructor argument, this string, called a delimiter string, is written to the stream after every T is written.
namespace std {
  template<class T, class charT = char, class traits = char_traits<charT>>
  class ostream_iterator {
    public:
      using iterator_category = output_iterator_tag;
      using value_type = void;
      using difference_type = ptrdiff_t;
      using pointer = void;
      using reference = void;
      using char_type = charT;
      using traits_type = traits;
      using ostream_type = basic_ostream<charT, traits>;
      constexpr ostream_iterator() noexcept = default;
      ostream_iterator(ostream_type& s);
      ostream_iterator(ostream_type& s, const charT* delimiter);
      ostream_iterator(const ostream_iterator& x);
      ~ostream_iterator();
      ostream_iterator& operator=(const ostream_iterator&); = default;
      ostream_iterator& operator=(const T& value);
      ostream_iterator& operator*();
      ostream_iterator& operator++();
      ostream_iterator& operator++(int);
    private:
      basic_ostream<charT, traits>* out_stream = nullptr;
      // exposition only
      const charT* delim = nullptr;
      // exposition only
  };
}

23.6.2.1 Constructors and destructor

ostream_iterator(ostream_type& s);

1 Effects: Initializes out_stream with addressof(s) and delim with nullptr.

ostream_iterator(ostream_type& s, const charT* delimiter);

2 Effects: Initializes out_stream with addressof(s) and delim with delimiter.

23.6.2.2 Operations

ostream_iterator& operator=(const T& value);

1 Effects: As if by:
   *out_stream << value;
   if (delim)
     *out_stream << delim;
   return *this;

ostream_iterator& operator*();

2 Returns: *this.

ostream_iterator& operator++();

ostream_iterator& operator++(int);

3 Returns: *this.

23.6.3 Class template istreambuf_iterator

The class template istreambuf_iterator defines an input iterator that reads successive characters from the streambuf for which it was constructed. operator* provides access to the current input character, if any. Each time operator++ is evaluated, the iterator advances to the next input character. If the end of stream is reached (streambuf_type::sgetc() returns traits::eof()), the iterator becomes equal to the end-of-stream iterator value. The default constructor istreambuf_iterator() and the constructor istreambuf_iterator(nullptr) both construct an end-of-stream iterator object suitable for use as an
end-of-range. All specializations of `istreambuf_iterator` shall have a trivial copy constructor, a `constexpr` default constructor, and a trivial destructor.

The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator value a `char_type` value is returned. It is impossible to assign a character via an input iterator.

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class istreambuf_iterator {
        public:
            using iterator_category = input_iterator_tag;
            using value_type = charT;
            using difference_type = typename traits::off_type;
            using pointer = unspecified;
            using reference = charT;
            using char_type = charT;
            using traits_type = traits;
            using int_type = typename traits::int_type;
            using streambuf_type = basic_streambuf<charT,traits>;
            using istream_type = basic_istream<charT,traits>;
            class proxy; // exposition only

            constexpr istreambuf_iterator() noexcept;
            constexpr istreambuf_iterator(default_sentinel_t) noexcept;
            istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
            istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
            istreambuf_iterator(istream_type& s) noexcept;
            istreambuf_iterator(streambuf_type* s) noexcept;
            istreambuf_iterator(const proxy& p) noexcept;
            istreambuf_iterator& operator=(const istreambuf_iterator&) noexcept = default;
            charT operator*() const;
            istreambuf_iterator& operator++();
            proxy operator++(int);
            bool equal(const istreambuf_iterator& b) const;
            friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
        private:
            streambuf_type* sbuf_; // exposition only
        }
    }
}
```

### 23.6.3.1 Class istreambuf_iterator::proxy

Class `istreambuf_iterator<charT, traits>::proxy` is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class `istreambuf_iterator<charT, traits>::proxy` provides a temporary placeholder as the return value of the post-increment operator (`operator++`). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

```cpp
namespace std {
    template<class charT, class traits>
    class istreambuf_iterator<charT, traits>::proxy { // exposition only
        charT keep_;
        basic_streambuf<charT,traits>* sbuf_;
        proxy(charT c, basic_streambuf<charT,traits>* sbuf) :
            keep_(c), sbuf_(sbuf) {}
        public:
            charT operator*() { return keep_; }
        }
    }
}
```
23.6.3.2 Constructors

For each `istreambuf_iterator` constructor in this subclause, an end-of-stream iterator is constructed if and only if the exposition-only member `sbuf_` is initialized with a null pointer value.

```cpp
constexpr istreambuf_iterator() noexcept;
```

`Effects:` Initializes `sbuf_` with `nullptr`.

```cpp
constexpr istreambuf_iterator(default_sentinel_t) noexcept;
```

`Effects:` Initializes `sbuf_` with `s.rdbuf()`.

```cpp
istreambuf_iterator(istream_type& s) noexcept;
```

`Effects:` Initializes `sbuf_` with `s.rdbuf()`.

```cpp
istreambuf_iterator(streambuf_type* s) noexcept;
```

`Effects:` Initializes `sbuf_` with `s`.

```cpp
istreambuf_iterator(const proxy& p) noexcept;
```

`Effects:` Initializes `sbuf_` with `p.sbuf_`.

23.6.3.3 Operations

```cpp
charT operator*() const;
```

`Returns:` The character obtained via the `streambuf` member `sbuf_->sgetc()`.

```cpp
istreambuf_iterator& operator++();
```

`Effects:` As if by `sbuf_->sbumpc()`.

```cpp
proxy operator++(int);
```

`Returns:` `proxy(sbuf_->sbumpc(), sbuf_)`.

```cpp
bool equal(const istreambuf_iterator& b) const;
```

`Returns:` `true` if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what `streambuf` object they use.

```cpp
template<class charT, class traits>
bool operator==(const istreambuf_iterator<charT,traits>& a,
const istreambuf_iterator<charT,traits>& b);
```

`Returns:` `a.equal(b)`.

```cpp
friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
```

`Returns:` `i.equal(s)`.

23.6.4 Class template `ostreambuf_iterator`

The class template `ostreambuf_iterator` writes successive characters onto the output stream from which it was constructed.

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class ostreambuf_iterator {
public:
        using iterator_category = output_iterator_tag;
        using value_type = void;
        using difference_type = ptrdiff_t;
        using pointer = void;
        using reference = void;
        using char_type = charT;
        using traits_type = traits;
        using streambuf_type = basic_streambuf<charT,traits>;
        using ostream_type = basic_ostream<charT,traits>;
    }
}
```
 constexpr ostreambuf_iterator() noexcept = default;
ostreambuf_iterator(ostream_type& s) noexcept;
ostreambuf_iterator(streambuf_type* s) noexcept;
ostreambuf_iterator& operator=(charT c);
ostreambuf_iterator& operator*();
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
bool failed() const noexcept;

private:
    streambuf_type* sbuf_ = nullptr;  // exposition only
};

23.6.4.1 Constructors

ostreambuf_iterator(ostream_type& s) noexcept;
1  Preconditions: s.rdbuf() is not a null pointer.
2  Effects: Initializes sbuf_ with s.rdbuf().

ostreambuf_iterator(streambuf_type* s) noexcept;
3  Preconditions: s is not a null pointer.
4  Effects: Initializes sbuf_ with s.

23.6.4.2 Operations

ostreambuf_iterator& operator=(charT c);
1  Effects: If failed() yields false, calls sbuf_->sputc(c); otherwise has no effect.
2  Returns: *this.

ostreambuf_iterator& operator*();
3  Returns: *this.

ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
4  Returns: *this.

bool failed() const noexcept;
5  Returns: true if in any prior use of member operator=, the call to sbuf_->sputc() returned
traits::eof(); or false otherwise.

23.7 Range access

In addition to being available via inclusion of the <iterator> header, the function templates in 23.7 are
available when any of the following headers are included: <array> (22.3.2), <deque> (22.3.3), <forward_list>
(22.3.4), <list> (22.3.5), <map> (22.4.2), <regex> (30.4), <set> (22.4.3), <span> (22.7.2), <string> (21.3.1),
<string_view> (21.4.1), <unordered_map> (22.5.2), <unordered_set> (22.5.3), and <vector> (22.3.6). Each
of these templates is a designated customization point (16.5.4.2.1).

template<class C> constexpr auto begin(C& c) -> decltype(c.begin());
2  Returns: c.begin().

template<class C> constexpr auto begin(const C& c) -> decltype(c.begin());
3  Returns: c.begin().

template<class C> constexpr auto end(C& c) -> decltype(c.end());
4  Returns: c.end().

template<class C> constexpr auto end(const C& c) -> decltype(c.end());
5  Returns: c.end().

template<class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;
6  Returns: array.
template<class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;

5 Returns: array + N.

template<class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c)))
-> decltype(std::begin(c));
6 Returns: std::begin(c).

template<class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c)))
-> decltype(std::end(c));
7 Returns: std::end(c).

template<class C> constexpr auto rbegin(const C& c) noexcept(noexcept(std::rbegin(c)))
-> decltype(c.rbegin());
8 Returns: c.rbegin().

template<class C> constexpr auto rend(const C& c) noexcept(noexcept(std::rend(c)))
-> decltype(c.rend());
9 Returns: c.rend().

template<class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);
10 Returns: reverse_iterator<T*>(array + N).

template<class T, size_t N> constexpr reverse_iterator<T*> rend(T (&array)[N]);
11 Returns: reverse_iterator<T*>(array).

template<class E> constexpr reverse_iterator<const E*> rbegin(initializer_list<E> il);
12 Returns: reverse_iterator<const E*>(il.end()).

template<class E> constexpr reverse_iterator<const E*> rend(initializer_list<E> il);
13 Returns: reverse_iterator<const E*>(il.begin()).

template<class C> constexpr auto crbegin(const C& c) noexcept(noexcept(std::rbegin(c)))
-> decltype(std::rbegin(c));
14 Returns: std::rbegin(c).

template<class C> constexpr auto crend(const C& c) noexcept(noexcept(std::rend(c)))
-> decltype(std::rend(c));
15 Returns: std::rend(c).

template<class C> constexpr auto size(const C& c) noexcept;
16 Returns: c.size().

template<class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;
17 Returns: N.

template<class C> constexpr auto ssize(const C& c) noexcept;
18 Effects: Equivalent to:
return static_cast<common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>>(c.size());

template<class T, pptrdiff_t N> constexpr pptrdiff_t ssize(const T (&array)[N]) noexcept;
19 Returns: N.

template<class C> [[nodiscard]] constexpr auto empty(const C& c) noexcept;
20 Returns: c.empty().

template<class T, size_t N> [[nodiscard]] constexpr bool empty(const T (&array)[N]) noexcept;
21 Returns: false.
template<class E> [[nodiscard]] constexpr bool empty(initializer_list<E> il) noexcept;

Returns: il.size() == 0.

template<class C> constexpr auto data(C& c) -> decltype(c.data());
template<class C> constexpr auto data(const C& c) -> decltype(c.data());

Returns: c.data().

template<class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;

Returns: array.

template<class E> constexpr const E* data(initializer_list<E> il) noexcept;

Returns: il.begin().
24 Ranges library

24.1 General

This clause describes components for dealing with ranges of elements.

The following subclauses describe range and view requirements, and components for range primitives as summarized in Table 90.

}

1 Within this clause, for an integer-like type \( X \) (23.3.4.4), \texttt{make-unsigned-like-t\langle X\rangle} denotes \texttt{make_unsigned-like-t\langle X\rangle} if \( X \) is an integer type; otherwise, it denotes a corresponding unspecified unsigned-integer-like type of the same width as \( X \). For an expression \( x \) of type \( X \), \texttt{to-unsigned-like}(x) is \( x \) explicitly converted to \texttt{make-unsigned-like-t\langle X\rangle}.
24.3 Range access

In addition to being available via inclusion of the `<ranges>` header, the customization point objects in 24.3 are available when `<iterator>` (23.2) is included.

Within this subclause, the `reified object` of a subexpression `E` denotes

1. the same object as `E` if `E` is a glvalue, or
2. the result of applying the temporary materialization conversion (7.3.4) to `E` otherwise.

24.3.1 `ranges::begin`

The name `ranges::begin` denotes a customization point object (16.4.2.2.6).

Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

1. If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::begin(E)` is ill-formed.
2. Otherwise, if `T` is an array type (6.8.2) and `remove_all_extents_t<T>` is an incomplete type, `ranges::begin(E)` is ill-formed with no diagnostic required.
3. Otherwise, if `T` is an array type, `ranges::begin(E)` is expression-equivalent to `t + 0`.
4. Otherwise, if `T` is an array of unknown bound, `ranges::begin(E)` is ill-formed.
5. Otherwise, if `T` is an array, `ranges::begin(E)` is expression-equivalent to `t.extent_v<T>`.
6. Otherwise, if `T` is a class or enumeration type and `decay-copy(t.end())` is a valid expression whose type models `sentinel_for<iterator_t<T>>` with overload resolution performed in a context in which unqualified lookup for `end` finds the declarations

   ```
   void end(auto&) = delete;
   void end(const auto&) = delete;
   ```

   then `ranges::begin(E)` is expression-equivalent to `decay-copy(end(t))` with overload resolution performed in the above context.
7. Otherwise, `ranges::begin(E)` is ill-formed.

3 [Note: Diagnosable ill-formed cases above result in substitution failure when `ranges::begin(E)` appears in the immediate context of a template instantiation. — end note]

4 [Note: Whenever `ranges::begin(E)` is a valid expression, its type models `input_or_output_iterator`. — end note]

24.3.2 `ranges::end`

The name `ranges::end` denotes a customization point object (16.4.2.2.6).

Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

1. If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::end(E)` is ill-formed.
2. Otherwise, if `T` is an array type (6.8.2) and `remove_all_extents_t<T>` is an incomplete type, `ranges::end(E)` is ill-formed with no diagnostic required.
3. Otherwise, if `T` is an array of unknown bound, `ranges::end(E)` is ill-formed.
4. Otherwise, if `T` is an array, `ranges::end(E)` is expression-equivalent to `t.extent_v<T>`.
5. Otherwise, if `T` is an array of unknown bound, `ranges::end(E)` is ill-formed.
6. Otherwise, if `T` is a class or enumeration type and `decay-copy(t.end())` is a valid expression whose type models `sentinel_for<iterator_t<T>>` with overload resolution performed in a context in which unqualified lookup for `end` finds the declarations

   ```
   void end(auto&) = delete;
   void end(const auto&) = delete;
   ```

   then `ranges::end(E)` is expression-equivalent to `decay-copy(end(t))` with overload resolution performed in the above context.
7. Otherwise, `ranges::end(E)` is ill-formed.
Note: Diagnosable ill-formed cases above result in substitution failure when `ranges::end(E)` appears in the immediate context of a template instantiation. —end note

Note: Whenever `ranges::end(E)` is a valid expression, the types S and I of `ranges::end(E)` and `ranges::begin(E)` model `sentinel_for<S, I>`. —end note

### 24.3.3 `ranges::cbegin`

The name `ranges::cbegin` denotes a customization point object (16.4.2.2.6). The expression `ranges::cbegin(E)` for a subexpression E of type T is expression-equivalent to:

- (1.1) `ranges::begin(static_cast<const T&>(E))` if E is an lvalue.
- (1.2) `ranges::begin(static_cast<const T&&>(E))`.

Note: Whenever `ranges::cbegin(E)` is a valid expression, its type models `input_or_output_iterator`. —end note

### 24.3.4 `ranges::cend`

The name `ranges::cend` denotes a customization point object (16.4.2.2.6). The expression `ranges::cend(E)` for a subexpression E of type T is expression-equivalent to:

- (1.1) `ranges::end(static_cast<const T&>(E))` if E is an lvalue.
- (1.2) `ranges::end(static_cast<const T&&>(E))`.

Note: Whenever `ranges::cend(E)` is a valid expression, the types S and I of `ranges::cend(E)` and `ranges::cbegin(E)` model `sentinel_for<S, I>`. —end note

### 24.3.5 `ranges::rbegin`

The name `ranges::rbegin` denotes a customization point object (16.4.2.2.6).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

- (2.1) If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::rbegin(E)` is ill-formed.
- (2.2) Otherwise, if T is an array type (6.8.2) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rbegin(E)` is ill-formed with no diagnostic required.
- (2.3) Otherwise, if `decay-copy(t.rbegin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::rbegin(E)` is expression-equivalent to `decay-copy(t.rbegin())`.
- (2.4) Otherwise, if T is a class or enumeration type and `decay-copy(rbegin(t))` is a valid expression whose type models `input_or_output_iterator` with overload resolution performed in a context in which unqualified lookup for `rbegin` finds only the declarations
  ```
  void rbegin(auto&) = delete;
  void rbegin(const auto&) = delete;
  ```
  then `ranges::rbegin(E)` is expression-equivalent to `decay-copy(rbegin(t))` with overload resolution performed in the above context.
- (2.5) Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (23.3.4.12), `ranges::rbegin(E)` is expression-equivalent to `make_reverse_iterator(ranges::end(t))`.
- (2.6) Otherwise, `ranges::rbegin(E)` is ill-formed.

Note: Diagnosable ill-formed cases above result in substitution failure when `ranges::rbegin(E)` appears in the immediate context of a template instantiation. —end note

Note: Whenever `ranges::rbegin(E)` is a valid expression, its type models `input_or_output_iterator`. —end note

### 24.3.6 `ranges::rend`

The name `ranges::rend` denotes a customization point object (16.4.2.2.6).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

- (2.1) If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::rend(E)` is ill-formed.
(2.2) Otherwise, if $T$ is an array type (6.8.2) and $\text{remove\_all\_extents\_t<T>$ is an incomplete type, $\text{ranges::rend}(E)$ is ill-formed with no diagnostic required.

(2.3) Otherwise, if $\text{decay-copy}(t.\text{rend}())$ is a valid expression whose type models $\text{sentinel\_for<decl-type(ranges::rbegin(E))}>$ then $\text{ranges::rend}(E)$ is expression-equivalent to $\text{decay-copy}(t.\text{rend}())$.

(2.4) Otherwise, if $T$ is a class or enumeration type and $\text{decay-copy}(\text{rend}(t))$ is a valid expression whose type models $\text{sentinel\_for<decl-type(ranges::rbegin(E))}>$ with overload resolution performed in a context in which unqualified lookup for $\text{rend}$ finds only the declarations

```cpp
void rend(auto&) = delete;
void rend(const auto&) = delete;
```

then $\text{ranges::rend}(E)$ is expression-equivalent to $\text{decay-copy}(\text{rend}(t))$ with overload resolution performed in the above context.

(2.5) Otherwise, if both $\text{ranges::begin}(t)$ and $\text{ranges::end}(t)$ are valid expressions of the same type which models $\text{bidirectional\_iterator (23.3.4.12)}$, then $\text{ranges::rend}(E)$ is expression-equivalent to $\text{decay-copy}(\text{rend}(t))$.

(2.6) Otherwise, $\text{ranges::rend}(E)$ is ill-formed.

3 [Note: Diagnosable ill-formed cases above result in substitution failure when $\text{ranges::rend}(E)$ appears in the immediate context of a template instantiation. —end note]

4 [Note: Whenever $\text{ranges::rend}(E)$ is a valid expression, the types $S$ and $I$ of $\text{ranges::rend}(E)$ and $\text{ranges::rbegin(E)}$ model $\text{sentinel\_for<S, I>}$. —end note]

### 24.3.7 ranges::crbegin

The name $\text{ranges::crbegin}$ denotes a customization point object (16.4.2.2.6). The expression $\text{ranges::crbegin}(E)$ for a subexpression $E$ of type $T$ is expression-equivalent to:

1. $\text{ranges::rbegin(static\_cast<const T&>(E))}$ if $E$ is an lvalue.
2. $\text{ranges::rbegin(static\_cast<const T&&>(E))}$. $\text{ranges::crbegin(E)}$ is a valid expression, its type models $\text{input\_or\_output\_iterator}$. —end note]

### 24.3.8 ranges::crend

The name $\text{ranges::crend}$ denotes a customization point object (16.4.2.2.6). The expression $\text{ranges::crend}(E)$ for a subexpression $E$ of type $T$ is expression-equivalent to:

1. $\text{ranges::rend(static\_cast<const T&>(E))}$ if $E$ is an lvalue.
2. $\text{ranges::rend(static\_cast<const T&&>(E))}$. $\text{ranges::crend(E)}$ is a valid expression, the types $S$ and $I$ of $\text{ranges::rend}(E)$ and $\text{ranges::rbegin(E)}$ model $\text{sentinel\_for<S, I>}$. —end note]

### 24.3.9 ranges::size

The name $\text{ranges::size}$ denotes a customization point object (16.4.2.2.6).

1. Given a subexpression $E$ with type $T$, let $t$ be an lvalue that denotes the reified object for $E$. Then:
2. If $T$ is an array of unknown bound (9.3.3.4), $\text{ranges::size(E)}$ is ill-formed.
3. Otherwise, if $T$ is an array type, $\text{ranges::size(E)}$ is expression-equivalent to $\text{decay-copy(extent_t<T>)}$.
4. Otherwise, if $\text{disable\_sized\_range<remove\_cv_t<T>>>() (24.4.3}$ is false and $\text{decay-copy(t.size())}$ is a valid expression of integer-like type (23.3.4.4), $\text{ranges::size(E)}$ is expression-equivalent to $\text{decay-copy(t.size())}$.
5. Otherwise, if $T$ is a class or enumeration type, $\text{disable\_sized\_range<remove\_cv_t<T>>>() is false and decay-copy(size(t))}$ is a valid expression of integer-like type with overload resolution performed in a context in which unqualified lookup for $\text{size}$ finds only the declarations

```cpp
void size(auto&) = delete;
void size(const auto&) = delete;
```
then `ranges::size(E)` is expression-equivalent to `decay-copy(size(t))` with overload resolution performed in the above context.

2.5. — Otherwise, if `to-unsigned-like(ranges::end(t) - ranges::begin(t))` (24.2) is a valid expression and the types I and S of `ranges::begin(t)` and `ranges::end(t)` (respectively) model both `sized_sentinel_for<S, I>` (23.3.4.8) and `forward_iterator<I>`, then `ranges::size(E)` is expression-equivalent to `to-unsigned-like(ranges::end(t) - ranges::begin(t))`.

2.6. — Otherwise, `ranges::size(E)` is ill-formed.

```
[Note: Diagnosable ill-formed cases above result in substitution failure when `ranges::size(E)` appears in the immediate context of a template instantiation. — end note]
```

### 24.3.10 `ranges::ssize`

The name `ranges::ssize` denotes a customization point object (16.4.2.2.6). The expression `ranges::ssize(E)` for a subexpression `E` of type `T` is expression-equivalent to:

- If `range_difference_t<T>` has width less than `ptrdiff_t`, `static_cast<ptrdiff_t>(ranges::size(E))`.

- Otherwise, `static_cast<range_difference_t<T>>(ranges::size(E))`.

### 24.3.11 `ranges::empty`

The name `ranges::empty` denotes a customization point object (16.4.2.2.6).

Given a subexpression `ranges::empty(E)` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

- If `T` is an array of unknown bound (6.8.2), `ranges::empty(E)` is ill-formed.

- Otherwise, if `bool(t.empty())` is a valid expression, `ranges::empty(E)` is expression-equivalent to `bool(t.empty())`.

- Otherwise, if `(ranges::size(t) == 0)` is a valid expression, `ranges::empty(E)` is expression-equivalent to `(ranges::size(t) == 0)`.

- Otherwise, if `bool(ranges::begin(t) == ranges::end(t))` is a valid expression and the type of `ranges::begin(t)` models `forward_iterator`, `ranges::empty(E)` is expression-equivalent to `bool(ranges::begin(t) == ranges::end(t))`.

- Otherwise, `ranges::empty(E)` is ill-formed.

```
[Note: Diagnosable ill-formed cases above result in substitution failure when `ranges::empty(E)` appears in the immediate context of a template instantiation. — end note]
```

### 24.3.12 `ranges::data`

The name `ranges::data` denotes a customization point object (16.4.2.2.6).

Given a subexpression `ranges::data(E)` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

- If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::data(E)` is ill-formed.

- Otherwise, if `T` is an array type (6.8.2) and `remove_all_extents_t<T>` is an incomplete type, `ranges::data(E)` is ill-formed with no diagnostic required.

- Otherwise, if `decay-copy(t.data())` is a valid expression of pointer to object type, `ranges::data(E)` is expression-equivalent to `decay-copy(t.data())`.

- Otherwise, if `ranges::begin(t)` is a valid expression whose type models `contiguous_iterator`, `ranges::data(E)` is expression-equivalent to `to_address(ranges::begin(E))`.

- Otherwise, `ranges::data(E)` is ill-formed.

```
[Note: Diagnosable ill-formed cases above result in substitution failure when `ranges::data(E)` appears in the immediate context of a template instantiation. — end note]
```

### Notes:

- Whenever `ranges::empty(E)` is a valid expression, its type is `integer-like`.

- Whenever `ranges::data(E)` is a valid expression, it has type `bool`.

- Whenever `ranges::size(E)` is a valid expression, its type is `integer-like`.
24.3.13 ranges::cdata

The name ranges::cdata denotes a customization point object (16.4.2.2.6). The expression ranges::cdata(E) for a subexpression E of type T is expression-equivalent to:

(1.1) ranges::data(static_cast<const T&>(E)) if E is an lvalue.

(1.2) Otherwise, ranges::data(static_cast<const T&&>(E)).

[Note: Whenever ranges::cdata(E) is a valid expression, it has pointer to object type. —end note]

24.4 Range requirements

24.4.1 General

Ranges are an abstraction that allow a C++ program to operate on elements of data structures uniformly. Calling ranges::begin on a range returns an object whose type models input_or_output_iterator (23.3.4.6). Calling ranges::end on a range returns an object whose type S, together with the type I of the object returned by ranges::begin, models sentinel_for<S, I>. The library formalizes the interfaces, semantics, and complexity of ranges to enable algorithms and range adaptors that work efficiently on different types of sequences.

The range concept requires that ranges::begin and ranges::end return an iterator and a sentinel, respectively. The sized_range concept refines range with the requirement that ranges::size be amortized $O(1)$. The view concept specifies requirements on a range type with constant-time destruction and move operations.

Several refinements of range group requirements that arise frequently in concepts and algorithms. Common ranges are ranges for which ranges::begin and ranges::end return objects of the same type. Random access ranges are ranges for which ranges::begin returns a type that models random_access_iterator (23.3.4.13). (Contiguous, bidirectional, forward, input, and output ranges are defined similarly.) Viewable ranges can be converted to views.

24.4.2 Ranges

The range concept defines the requirements of a type that allows iteration over its elements by providing an iterator and sentinel that denote the elements of the range.

template<class T>
concept range =
  requires(T& t) {
    ranges::begin(t);
    ranges::end(t);
  } // sometimes equality-preserving (see below)

The required expressions ranges::begin(t) and ranges::end(t) of the range concept do not require implicit expression variations (18.2).

Given an expression t such that decltype((t)) is T, T models range only if

(3.1) both ranges::begin(t) and ranges::end(t) denotes a range (23.3.1),

(3.2) both ranges::begin(t) and ranges::end(t) are amortized constant time and non-modifying, and

(3.3) if the type of ranges::begin(t) models forward_iterator, ranges::begin(t) is equality-preserving.

[Note: Equality preservation of both ranges::begin and ranges::end enables passing a range whose iterator type models forward_iterator to multiple algorithms and making multiple passes over the range by repeated calls to ranges::begin and ranges::end. Since ranges::begin is not required to be equality-preserving when the return type does not model forward_iterator, repeated calls might not return equal values or might not be well-defined; ranges::begin should be called at most once for such a range. —end note]

template<class T>
concept borrowed_range =
  range<T> &&
Given an expression $E$ such that $\text{decltype}(E)$ is $T$, $T$ models $\text{borrowed\_range}$ only if the validity of iterators obtained from the object denoted by $E$ is not tied to the lifetime of that object.

[Note: Since the validity of iterators is not tied to the lifetime of an object whose type models $\text{borrowed\_range}$, a function can accept arguments of such a type by value and return iterators obtained from it without danger of dangling. —end note]

```cpp
template<class>
inline constexpr bool enable_borrowed_range = false;
```

Remarks: Pursuant to 16.5.4.2.1, users may specialize $\text{enable\_borrowed\_range}$ for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type $\text{const bool}$.

[Example: Each specialization $S$ of class template $\text{subrange}$ (24.5.3) models $\text{borrowed\_range}$ because

(8.1) $\text{enable\_borrowed\_range}<S>$ is specialized to have the value $\text{true}$, and

(8.2) $S$'s iterators do not have validity tied to the lifetime of an $S$ object because they are “borrowed” from some other range.

—end example]

24.4.3 Sized ranges

The $\text{sized\_range}$ concept refines $\text{range}$ with the requirement that the number of elements in the range can be determined in amortized constant time using $\text{ranges::size}$.

```cpp
template<class T>
concept sized_range =
\text{range<T> && requires(T& t) \{ ranges::size(t); \};}
```

Given an lvalue $t$ of type $\text{remove\_reference\_t<T>}$, $T$ models $\text{sized\_range}$ only if

(2.1) $\text{ranges::size}(t)$ is amortized $O(1)$, does not modify $t$, and is equal to $\text{ranges::distance}(t)$, and

(2.2) if $\text{iterator\_t<T>}$ models $\text{forward\_iterator}$, $\text{ranges::size}(t)$ is well-defined regardless of the evaluation of $\text{ranges::begin}(t)$. [Note: $\text{ranges::size}(t)$ is otherwise not required to be well-defined after evaluating $\text{ranges::begin}(t)$. For example, $\text{ranges::size}(t)$ might be well-defined for a $\text{sized\_range}$ whose iterator type does not model $\text{forward\_iterator}$ only if evaluated before the first call to $\text{ranges::begin}(t)$. —end note]

```cpp
template<class>
inline constexpr bool disable_sized_range = false;
```

Remarks: Pursuant to 16.5.4.2.1, users may specialize $\text{disable\_sized\_range}$ for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type $\text{const bool}$.

[Note: $\text{disable\_sized\_range}$ allows use of range types with the library that satisfy but do not in fact model $\text{sized\_range}$. —end note]

24.4.4 Views

The $\text{view}$ concept specifies the requirements of a $\text{range}$ type that has constant time move construction, move assignment, and destruction; that is, the cost of these operations is independent of the number of elements in the $\text{view}$.

```cpp
template<class T>
concept view =
\text{range<T> && movable<T> && default_initializable<T> && enable_view<T>};
```

$T$ models $\text{view}$ only if:

(2.1) $T$ has $O(1)$ move construction; and

(2.2) $T$ has $O(1)$ move assignment; and

(2.3) $T$ has $O(1)$ destruction; and
— copy_constructible<T> is false, or T has \(\mathcal{O}(1)\) copy construction; and
— copyable<T> is false, or T has \(\mathcal{O}(1)\) copy assignment.

[Example: Examples of views are:
— A range type that wraps a pair of iterators.
— A range type that holds its elements by shared_ptr and shares ownership with all its copies.
— A range type that generates its elements on demand.

Most containers (Clause 22) are not views since destruction of the container destroys the elements, which cannot be done in constant time. — end example]

Since the difference between range and view is largely semantic, the two are differentiated with the help of enable_view.

```cpp
template<class T>
inline constexpr bool enable_view = derived_from<T, view_base>;
```

Remarks: Pursuant to 16.5.4.2.1, users may specialize enable_view to true for cv-unqualified program-defined types which model view, and false for types which do not. Such specializations shall be usable in constant expressions (7.7) and have type const bool.

24.4.5 Other range refinements [range.refinements]

The output_range concept specifies requirements of a range type for which ranges::begin returns a model of output_iterator (23.3.4.10). input_range, forward_range, bidirectional_range, and random_access_range are defined similarly.

```cpp
template<class R, class T>
concept output_range =
    range<R> && output_iterator<iterator_t<R>, T>;
```

```cpp
template<class T>
concept input_range =
    range<T> && input_iterator<iterator_t<T>>;
```

```cpp
template<class T>
concept forward_range =
    input_range<T> && forward_iterator<iterator_t<T>>;
```

```cpp
template<class T>
concept bidirectional_range =
    forward_range<T> && bidirectional_iterator<iterator_t<T>>;
```

```cpp
template<class T>
concept random_access_range =
    bidirectional_range<T> && random_access_iterator<iterator_t<T>>;
```

contiguous_range additionally requires that the ranges::data customization point (24.3.12) is usable with the range.

```cpp
template<class T>
concept contiguous_range =
    random_access_range<T> && contiguous_iterator<iterator_t<T>> &&
    requires(T& t) {
    { ranges::data(t) } -> same_as<add_pointer_t<range_reference_t<T>>>;
    };
```

Given an expression t such that decltype((t)) is T&, T models contiguous_range only if to_address(ranges::begin(t)) == ranges::data(t) is true.

The common_range concept specifies requirements of a range type for which ranges::begin and ranges::end return objects of the same type. [Example: The standard containers (Clause 22) model common_range. — end example]
template<class T>
concept common_range =
    range<T> && same_as<iterator_t<T>, sentinel_t<T>>;

The `viewable_range` concept specifies the requirements of a `range` type that can be converted to a `view` safely.

template<class T>
concept viewable_range =
    range<T> && (borrowed_range<T> || view<remove_cvref_t<T>>);

24.5 Range utilities

The components in this subclause are general utilities for representing and manipulating ranges.

24.5.1 Helper concepts

Many of the types in subclause 24.5 are specified in terms of the following exposition-only concepts:

template<class R>
concept simple_view =
    // exposition only
    view<R> && range<const R> &&
    same_as<iterator_t<R>, iterator_t<const R>> &&
    same_as<sentinel_t<R>, sentinel_t<const R>>;

template<class I>
concept has-arrow =
    // exposition only
    input_iterator<I> && (is_pointer_v<I> || requires(I i) { i.operator->(); });

template<class T, class U>
concept not_same_as =
    // exposition only
    !same_as<remove_cvref_t<T>, remove_cvref_t<U>>;

24.5.2 View interface

The class template `view_interface` is a helper for defining `view`-like types that offer a container-like interface. It is parameterized with the type that is derived from it.

namespace std::ranges {
    template<class D>
        requires is_class_v<D> && same_as<D, remove_cv_t<D>>
    class view_interface : public view_base {
    private:
        constexpr D& derived() noexcept {
            // exposition only
            return static_cast<D&>(*this);
        }
        constexpr const D& derived() const noexcept {
            // exposition only
            return static_cast<const D&>(*this);
        }
    public:
        constexpr bool empty() requires forward_range<D> {
            return ranges::begin(derived()) == ranges::end(derived());
        }
        constexpr bool empty() const requires forward_range<const D> {
            return ranges::begin(derived()) == ranges::end(derived());
        }
        constexpr explicit operator bool() {
            requires requires { ranges::empty(derived()); } {
                return !ranges::empty(derived());
            }
        }
        constexpr explicit operator bool() const {
            requires requires { ranges::empty(derived()); } {
                return !ranges::empty(derived());
            }
        }
    }
}
constexpr auto data() requires contiguous_iterator<iterator_t<D>> {
    return to_address(ranges::begin(derived()));
}
constexpr auto data() const
requires range<const D> && contiguous_iterator<iterator_t<const D>> {
    return to_address(ranges::begin(derived()));
}
constexpr auto size() requires forward_range<D> && sized_sentinel_for<sentinel_t<D>, iterator_t<D>> {
    return ranges::end(derived()) - ranges::begin(derived());
}
constexpr auto size() const requires forward_range<const D> && sized_sentinel_for<sentinel_t<const D>, iterator_t<const D>> {
    return ranges::end(derived()) - ranges::begin(derived());
}
constexpr decltype(auto) front() requires forward_range<D>;                
constexpr decltype(auto) front() const requires forward_range<const D>;
constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;    
constexpr decltype(auto) back() const requires bidirectional_range<const D> && common_range<const D>;

namespace std::ranges {
    template<class From, class To>
    concept convertible_to_non_slicing =                  
        convertible_to<From, To> &&
        !is_pointer_v<decay_t<From>> &&
        !is_pointer_v<decay_t<To>> &&

§ 24.5.3 ©ISO/IEC 2020 – All rights reserved 973
template<class T>
concept pair-like =

};

template<input_or_output_iterator I, sentinel_for<I> S>
subrange(I, S) -> subrange<I, S>;

template<input_or_output_iterator I, sentinel_for<I> S>
subrange(I, S, make-unsigned-like-t<iter_difference_t<I>>)
  -> subrange<I, S, subrange_kind::sized>;

template<iterator-sentinel-pair P>
subrange(P) -> subrange<tuple_element_t<0, P>, tuple_element_t<1, P>>;

template<iterator-sentinel-pair P>
subrange(P, make-unsigned-like-t<iter_difference_t<tuple_element_t<0, P>>>)
  -> subrange<tuple_element_t<0, P>, tuple_element_t<1, P>, subrange_kind::sized>;

template<borrowed_range R>
subrange(R&&) -> subrange<iterator_t<R>, sentinel_t<R>,
  (sized_range<R> || sized_sentinel_for<sentinel_t<R>, iterator_t<R>>)?
  subrange_kind::sized : subrange_kind::unsized>;

template<borrowed_range R>
subrange(R&&, make-unsigned-like-t<range_difference_t<R>>)
  -> subrange<iterator_t<R>, sentinel_t<R>, subrange_kind::sized>;

template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(const subrange<I, S, K>& r);

template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(subrange<I, S, K>&& r);

} namespace std {

using ranges::get;

} 

24.5.3.1 Constructors and conversions 

constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);
1 Preconditions: [i, s) is a valid range.
2 Effects: Initializes begin_ with std::move(i) and end_ with s.

constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
  make-unsigned-like-t<iter_difference_t<I>> n)
  requires (K == subrange_kind::sized);
3 Preconditions: [i, s) is a valid range, and n == to-unsigned-like(ranges::distance(i, s)).
Effects: Initializes \begin{var}{i} with std::move(i) and \end{var} with s. If \texttt{StoreSize} is \texttt{true}, initializes \texttt{size} with n.

[Note: Accepting the length of the range and storing it to later return from \texttt{size()} enables \texttt{subrange} to model \texttt{sized_range} even when it stores an iterator and sentinel that do not model \texttt{sized_sentinel_for}. — end note]

```cpp
template<not same-as<subrange> R>
requires borrowed_range<R> &&
convertible-to-non-slicing<iterator_t<R>, I> &&
convertible_to<sentinel_t<R>, S>
constexpr subrange<R&& r) requires (!StoreSize || sized_range<R>);
```

Effects: Equivalent to:

(6.1) — If \texttt{StoreSize} is \texttt{true}, \texttt{subrange{r, ranges::size(r)}}.

(6.2) — Otherwise, \texttt{subrange{ranges::begin(r), ranges::end(r)}}.

```cpp
template<not same-as<subrange> PairLike>
requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;
```

Effects: Equivalent to: \texttt{return PairLike(begin_, end_);}

### 24.5.3.2 Accessors

constexpr I begin() const requires copyable<I>;

Effects: Equivalent to: \texttt{return begin_};

[[nodiscard]] constexpr I begin() requires (!copyable<I>);

Effects: Equivalent to: \texttt{return std::move(begin_)};

constexpr S end() const;

Effects: Equivalent to: \texttt{return end_};

constexpr bool empty() const;

Effects: Equivalent to: \texttt{return begin_ == end_};

constexpr make_unsigned-like-t<iter_difference_t<I>> size() const
requires (K == subrange_kind::sized);

Effects:

(5.1) — If \texttt{StoreSize} is \texttt{true}, equivalent to: \texttt{return size_};

(5.2) — Otherwise, equivalent to: \texttt{return to_unsigned-like(end_ - begin_)};

[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const &
requires forward_iterator<I>;

Effects: Equivalent to:

```cpp
auto tmp = *this;
tmp.advance(n);
return tmp;
```

[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) &&;

Effects: Equivalent to:

```cpp
advance(n);
return std::move(*this);
```

[[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const
requires bidirectional_iterator<I>;

Effects: Equivalent to:

```cpp
auto tmp = *this;
tmp.advance(-n);
return tmp;
```
constexpr subrange& advance(iter_difference_t<I> n);

Effects: Equivalent to:

— If StoreSize is true,
  
  auto d = n - ranges::advance(begin_, n, end_);
  if (d >= 0)
    size_ -= to-unsigned-like(d);
  else
    size_ += to-unsigned-like(-d);
  return *this;

— Otherwise,
  
  ranges::advance(begin_, n, end_);
  return *this;

```cpp
template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(const subrange<I, S, K>& r);
```

```cpp
template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(subrange<I, S, K>&& r);
```

Effects: Equivalent to:

```cpp
if constexpr (N == 0)
  return r.begin();
else
  return r.end();
```

24.5.4 Dangling iterator handling

The tag type `dangling` is used together with the template aliases `borrowed_iterator_t` and `borrowed_subrange_t` to indicate that an algorithm that typically returns an iterator into or subrange of a range argument does not return an iterator or subrange which could potentially reference a range whose lifetime has ended for a particular rvalue range argument which does not model `borrowed_range` (24.4.2).

namespace std::ranges {
  struct dangling {
    constexpr dangling() noexcept = default;
    template<class... Args>
    constexpr dangling(Args&&...) noexcept { }
  };
}

```
[Example:

```cpp
vector<int> f();
auto result1 = ranges::find(f(), 42); // #1
static_assert(same_as<decltype(result1), ranges::dangling>);
auto vec = f();
auto result2 = ranges::find(vec, 42); // #2
static_assert(same_as<decltype(result2), vector<int>::iterator>);
auto result3 = ranges::find(subrange{vec}, 42); // #3
static_assert(same_as<decltype(result3), vector<int>::iterator>);
```

The call to `ranges::find` at #1 returns `ranges::dangling` since `f()` is an rvalue vector; the vector could potentially be destroyed before a returned iterator is dereferenced. However, the calls at #2 and #3 both return iterators since the lvalue `vec` and specializations of `subrange` model `borrowed_range`. — end example]

24.6 Range factories

This subclause defines `range factories`, which are utilities to create a `view`.

Range factories are declared in namespace `std::ranges::views`.
24.6.1 Empty view

24.6.1.1 Overview

`empty_view` produces a view of no elements of a particular type.

1 empty_view produces a view of no elements of a particular type.

2 [Example:
   ```cpp
   empty_view<int> e;
   static_assert(ranges::empty(e));
   static_assert(0 == e.size());
   -- end example]

24.6.1.2 Class template empty_view

namespace std::ranges {
   template<class T>
   requires is_object_v<T>
   class empty_view : public view_interface<empty_view<T>> {
      public:
      static constexpr T* begin() noexcept { return nullptr; }
      static constexpr T* end() noexcept { return nullptr; }
      static constexpr T* data() noexcept { return nullptr; }
      static constexpr size_t size() noexcept { return 0; }
      static constexpr bool empty() noexcept { return true; }
   }
}

24.6.2 Single view

24.6.2.1 Overview

1 single_view produces a view that contains exactly one element of a specified value.

2 The name `views::single` denotes a customization point object (16.4.2.2.6). Given a subexpression E, the expression `views::single(E)` is expression-equivalent to `single_view{E}`.

3 [Example:
   ```cpp
   single_view s{4};
   for (int i : s)
      cout << i; // prints 4
   -- end example]

24.6.2.2 Class template single_view

namespace std::ranges {
   template<copy_constructible T>
   requires is_object_v<T>
   class single_view : public view_interface<single_view<T>> {
      private:
      semiregular-box<T> value_; // exposition only (see 24.7.2)
      public:
      single_view() = default;
      constexpr explicit single_view(const T& t);
      constexpr explicit single_view(T&& t);
      template<class... Args>
      requires constructible_from<T, Args...>
      constexpr single_view(in_place_t, Args&&... args);
      constexpr T* begin() noexcept;
      constexpr const T* begin() const noexcept;
      constexpr T* end() noexcept;
      constexpr const T* end() const noexcept;
      static constexpr size_t size() noexcept;
      constexpr T* data() noexcept;
      constexpr const T* data() const noexcept;
   }
}
constexpr explicit single_view(const T& t);

   Effects: Initializes value_ with t.

constexpr explicit single_view(T&& t);

   Effects: Initializes value_ with std::move(t).

template<class... Args>
constexpr single_view(in_place_t, Args&&... args);

   Effects: Initializes value_ as if by value_{in_place, std::forward<Args>(args)...}.

constexpr T* begin() noexcept;
constexpr const T* begin() const noexcept;

   Effects: Equivalent to: return data();

constexpr T* end() noexcept;
constexpr const T* end() const noexcept;

   Effects: Equivalent to: return data() + 1;

static constexpr size_t size() noexcept;

   Effects: Equivalent to: return 1;

constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

   Effects: Equivalent to: return value_.operator->();

24.6.3 Iota view

24.6.3.1 Overview

iota_view generates a sequence of elements by repeatedly incrementing an initial value.

2 The name views::iota denotes a customization point object (16.4.2.2.6). Given subexpressions E and F, the expressions views::iota(E) and views::iota(E, F) are expression-equivalent to iota_view{E} and iota_view{E, F}, respectively.

3 [Example:
for (int i : iota_view{1, 10})
cout << i << " " ; // prints: 1 2 3 4 5 6 7 8 9
— end example]

24.6.3.2 Class template iota_view

namespace std::ranges {

  template<class I>
  concept decrementable =
  see below;

  template<class I>
  concept advanceable =
  see below;

  template<weakly_incrementable W, semiregular Bound = unreachable_sentinel_t>
  requires weakly-equality-comparable-with<W, Bound> && semiregular<W>
  class iota_view : public view_interface<iota_view<W, Bound>> {

private:
// 24.6.3.3, class iota_view::iterator
  struct iterator;
// 24.6.3.4, class iota_view::sentinel
  struct sentinel;

  W value_ = W();
  Bound bound_ = Bound();

public:
  iota_view() = default;
  constexpr explicit iota_view(W value);
constexpr iota_view(type_identity_t<W> value, 
    type_identity_t<Bound> bound); 
constexpr iota_view(iterator first, sentinel last) : iota_view(*first, last.bound_) {} 

constexpr iterator begin() const; 
constexpr auto end() const; 
constexpr iterator end() const requires same_as<W, Bound>; 
constexpr auto size() const requires see below; 
}; 

template<class W, class Bound> 
requires (!is-integer-like<W> || !is-integer-like<Bound> ||
(is-signed-integer-like<W> == is-signed-integer-like<Bound>))
iota_view(W, Bound) -> iota_view<W, Bound>; 

1 Let $IOTA\text-T(W)$ be defined as follows: 

(1.1) — If $W$ is not an integral type, or if it is an integral type and 
sizeof(iter_difference_t<W>) is greater 

than sizeof(W), then $IOTA\text-T(W)$ denotes iter_difference_t<W>. 

(1.2) — Otherwise, $IOTA\text-T(W)$ is a signed integer type of width greater than the width of $W$ if such a type 

exists. 

(1.3) — Otherwise, $IOTA\text-T(W)$ is an unspecified signed-integer-like type (23.3.4.4) of width not less than 
the width of $W$. [Note: It is unspecified whether this type satisfies weakly_incrementable. — end 

note] 

2 The exposition-only decrementable concept is equivalent to: 

template<class I> 
concept decrementable =

incrementable<I> && requires(I i) {
    { --i } -> same_as<I&>; 
    { i-- } -> same_as<I>; 
}; 

When an object is in the domain of both pre- and post-decrement, the object is said to be decrementable. 

3 Let $a$ and $b$ be equal objects of type $I$. $I$ models decrementable only if 

(4.1) — If $a$ and $b$ are decrementable, then the following are all true: 

(4.1.1) — addressof(--a) == addressof(a) 

(4.1.2) — bool(a-- == b) 

(4.1.3) — bool(((void)a--, a) == --b) 

(4.1.4) — bool(+(--a) == b). 

(4.2) — If $a$ and $b$ are incrementable, then bool(---(++a) == b). 

4 The exposition-only advanceable concept is equivalent to: 

template<class I> 
concept advanceable =
dercrementable<I> && totally_ordered<I> &&
requires(I i, const I j, const IOTA\text-T(I) n) {
    { i += n } -> same_as<I&>; 
    { i -= n } -> same_as<I>; 
    I(j + n); 
    I(n + j); 
    I(j - n); 
    { j - j } -> convertible_to<IOTA\text-T(I)>; 
}; 

Let $D$ be $IOTA\text-T(I)$. Let $a$ and $b$ be objects of type $I$ such that $b$ is reachable from $a$ after $n$ applications 
of $++a$, for some value $n$ of type $D$. $I$ models advanceable only if 

(5.1) — $(a += n)$ is equal to $b$. 

§ 24.6.3.2 ©ISO/IEC 2020 – All rights reserved 980
— addressof(a += n) is equal to addressof(a).
(5.3) — I(a + n) is equal to (a += n).
(5.4) — For any two positive values x and y of type D, if I(a + D(x + y)) is well-defined, then I(a + D(x + y)) is equal to I((a + x) + y).
(5.5) — I(a + D(0)) is equal to a.
(5.6) — If I(a + D(n - 1)) is well-defined, then I(a + n) is equal to I((a + D(n - 1))).
(5.7) — (b += -n) is equal to a.
(5.8) — (b -= n) is equal to a.
(5.9) — addressof(b -= n) is equal to addressof(b).
(5.10) — I(b - n) is equal to (b -= n).
(5.11) — D(b - a) is equal to n.
(5.12) — D(a - b) is equal to D(-n).
(5.13) — bool(a <= b) is true.

constexpr explicit iota_view(W value);

Preconditions: Bound denotes unreachable_sentinel_t or Bound() is reachable from value.
Effects: Initializes value_ with value.

constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);

Preconditions: Bound denotes unreachable_sentinel_t or bound is reachable from value. When W and Bound model totally_ordered_with, then bool(value <= bound) is true.
Effects: Initializes value_ with value and bound_ with bound.

constexpr iterator begin() const;
Effects: Equivalent to: return iterator{value_};

constexpr auto end() const;
Effects: Equivalent to:
if constexpr (same_as<Bound, unreachable_sentinel_t>)
  return unreachable_sentinel;
else
  return sentinel{bound_};

constexpr iterator end() const requires same_as<W, Bound>;
Effects: Equivalent to: return iterator{bound_};

constexpr auto size() const requires see below;
Effects: Equivalent to:
if constexpr (is-integer-like<W> && is-integer-like<Bound>)
  return (value_ < 0)
    ? ((bound_ < 0)
      ? to-unsigned-like(-value_) - to-unsigned-like(-bound_)
      : to-unsigned-like(bound_) + to-unsigned-like(-value_))
    : to-unsigned-like(bound_) - to-unsigned-like(value_);
else
  return to-unsigned-like(bound_ - value_);
Remarks: The expression in the requires-clause is equivalent to
(same_as<W, Bound> && advanceable<W>) || (integral<W> && integral<Bound>) || sized_sentinel_for<Bound, W>

24.6.3.3 Class iota_view::iterator

namespace std::ranges {
  template<weakly_incrementable W, semiregular Bound>
requires weakly-equality-comparable-with<W, Bound>
struct iota_view<W, Bound>::iterator {
private:
  W value_ = W();  // exposition only
public:
  using iterator_concept = see below;
  using iterator_category = input_iterator_tag;
  using value_type = W;
  using difference_type = IOTA-DIFF-T(W);

  iterator() = default;
  constexpr explicit iterator(W value);
  constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);
  constexpr iterator& operator++();
  constexpr void operator++(int);
  constexpr iterator operator++(int) requires incrementable<W>;
  constexpr iterator operator++(int) requires decrementable<W>;
  constexpr iterator& operator--() requires decrementable<W>;
  constexpr iterator operator--(int) requires decrementable<W>;
  constexpr iterator& operator+=(difference_type n) requires advanceable<W>;
  constexpr iterator& operator-=(difference_type n) requires advanceable<W>;
  constexpr W operator[](difference_type n) const requires advanceable<W>;
  friend constexpr bool operator==(const iterator& x, const iterator& y) requires equality_comparable<W>;
  friend constexpr bool operator<(const iterator& x, const iterator& y) requires totally_ordered<W>;

friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
requires sized_sentinel_for<Bound, W>;

Effects: Equivalent to: return -(y - x);

24.6.4 Istream view

24.6.4.1 Overview

basic_istream_view models input_range and reads (using operator>>) successive elements from its corresponding input stream.

[Example:
  auto ints = istringstream("0 1 2 3 4");
  ranges::copy(istream_view<int>(ints), ostream_iterator<int>{cout, "-"});
  // prints 0-1-2-3-4-
  —end example]

24.6.4.2 Class template basic_istream_view

namespace std::ranges {
  template<class Val, class CharT, class Traits>
  concept stream-extractable =
      requires(stream-extractable<Val> & is, Val& t) {
        is >> t;
      };

  template<movable Val, class CharT, class Traits>
  requires default_initializable<Val> && stream-extractable<Val, CharT, Traits>
  class basic_istream_view : public view_interface<basic_istream_view<Val, CharT, Traits>> {
    public:
      basic_istream_view() = default;
      constexpr explicit basic_istream_view(basic_istream_view<Val, CharT, Traits>& stream);

      constexpr auto begin() {
        if (stream_) {
          *stream_ >> object_;
        }
      }
  };

§ 24.6.4.2 ©ISO/IEC 2020 – All rights reserved 985
constexpr default_sentinel_t end() const noexcept;
}

private:
struct iterator;
// exposition only
basic_istream<CharT, Traits> * stream_ = nullptr;  // exposition only
Val object_ = Val();  // exposition only
};

constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);
Effects: Initializes stream_ with addressof(stream).

constexpr default_sentinel_t end() const noexcept;
Effects: Equivalent to: return default_sentinel;

template<class Val, class CharT, class Traits>
basic_istream_view<Val, CharT, Traits> istream_view(basic_istream<CharT, Traits>& s);
Effects: Equivalent to: return basic_istream_view<Val, CharT, Traits>{s};

24.6.4.3 Class template basic_istream_view::iterator

namespace std::ranges {

    template<movable Val, class CharT, class Traits>
    requires default_initializable<Val> &&
    stream-extractable<Val, CharT, Traits>
class basic_istream_view<Val, CharT, Traits>::iterator {
        // exposition only

    public:
        using iterator_concept = input_iterator_tag;
        using difference_type = ptrdiff_t;
        using value_type = Val;

        iterator() = default;
        constexpr explicit iterator(basic_istream_view& parent) noexcept;
        iterator(const iterator&) = delete;
        iterator(iterator&&) = default;
        iterator& operator=(const iterator&) = delete;
        iterator& operator=(iterator&&) = default;
        iterator& operator++();
        void operator++(int);
        Val& operator*() const;
        friend bool operator==(const iterator& x, default_sentinel_t);

    private:
        basic_istream_view* parent_ = nullptr;  // exposition only
    }

    constexpr explicit iterator(basic_istream_view& parent) noexcept;
    Effects: Initializes parent_ with addressof(parent).

    iterator& operator++();
    Preconditions: parent_->stream_ != nullptr is true.
    Effects: Equivalent to:
        *parent_->stream_ >> parent_->object_;

§ 24.6.4.3 ©ISO/IEC 2020 – All rights reserved
return *this;

void operator++(int);

Preconditions: parent_->stream_ != nullptr is true.

Effects: Equivalent to ***this.

Val& operator*() const;

Preconditions: parent_->stream_ != nullptr is true.

Effects: Equivalent to: return parent_->object_;

friend bool operator==(const iterator& x, default_sentinel_t);

Effects: Equivalent to: return x.parent_ == nullptr || !x.parent_->stream_;

24.7 Range adaptors

This subclause defines range adaptors, which are utilities that transform a range into a view with custom behaviors. These adaptors can be chained to create pipelines of range transformations that evaluate lazily as the resulting view is iterated.

Range adaptors are declared in namespace std::ranges::views.

The bitwise OR operator is overloaded for the purpose of creating adaptor chain pipelines. The adaptors also support function call syntax with equivalent semantics.

[Example:

```cpp
vector<int> ints{0,1,2,3,4,5};
auto even = [](int i){ return 0 == i % 2; };
auto square = [](int i) { return i * i; };
for (int i : ints | views::filter(even) | views::transform(square)) {
  cout << i << ' ';
} // prints: 0 4 16
assert(ranges::equal(ints | views::filter(even), views::filter(ints, even));
```

—end example]

24.7.1 Range adaptor objects

A range adaptor closure object is a unary function object that accepts a viewable_range argument and returns a view. For a range adaptor closure object C and an expression R such that decltype((R)) models viewable_range, the following expressions are equivalent and yield a view:

C(R)
R | C

Given an additional range adaptor closure object D, the expression C | D is well-formed and produces another range adaptor closure object such that the following two expressions are equivalent:

R | C | D
R | (C | D)

A range adaptor object is a customization point object (16.4.2.2.6) that accepts a viewable_range as its first argument and returns a view.

If a range adaptor object accepts only one argument, then it is a range adaptor closure object.

If a range adaptor object accepts more than one argument, then the following expressions are equivalent:

adaptor(range, args...)
adaptor(args...)(range)
range | adaptor(args...)

In this case, adaptor(args...) is a range adaptor closure object.

24.7.2 Semiregular wrapper

Many types in this subclause are specified in terms of an exposition-only class template semiregular-box. semiregular-box<T> behaves exactly like optional<T> with the following differences:

semiregular-box<T> constrains its type parameter T with copy_constructible<T> & is_object_v<T>.
If \( T \) models `default_initializable`, the default constructor of `semiregular-box<T>` is equivalent to:

```cpp
constexpr semiregular-box() noexcept(is_nothrow_default_constructible_v<T>)
  : semiregular-box{in_place}
{
}
```

If `assignable_from<T&, const T&>` is not modeled, the copy assignment operator is equivalent to:

```cpp
semiregular-box& operator=(const semiregular-box& that)
  noexcept(is_nothrow_copy_constructible_v<T>)
{
  if (that) emplace(*that);
  else reset();
  return *this;
}
```

If `assignable_from<T&, T>` is not modeled, the move assignment operator is equivalent to:

```cpp
semiregular-box& operator=(semiregular-box&& that)
  noexcept(is_nothrow_move_constructible_v<T>)
{
  if (that) emplace(std::move(*that));
  else reset();
  return *this;
}
```

### 24.7.3 All view

1. `views::all` returns a `view` that includes all elements of its `range` argument.
2. The name `views::all` denotes a range adaptor object (24.7.1). Given a subexpression \( E \), the expression `views::all(E)` is expression-equivalent to:
   - `decay-copy(E)` if the decayed type of \( E \) models `view`.
   - Otherwise, `ref_view(E)` if that expression is well-formed.
   - Otherwise, `subrange(E)`.

#### 24.7.3.1 Class template ref_view

1. `ref_view` is a `view` of the elements of some other `range`.
2. `ref_view` is a `view` of the elements of some other `range`.

```cpp
namespace std::ranges {
  template<range R>
  requires is_object_v<R>
  class ref_view : public view_interface<ref_view<R>> {
    private:
      R* r_ = nullptr;  // exposition only
    public:
      constexpr ref_view() noexcept = default;

template<not_same_as<ref_view> T>
  requires see below
  constexpr ref_view(T&& t);

  constexpr R& base() const { return *r_; }

  constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
  constexpr sentinel_t<R> end() const { return ranges::end(*r_); }

  constexpr bool empty() const
    requires requires { ranges::empty(*r_); }
  { return ranges::empty(*r_); }

  constexpr auto size() const requires sized_range<R>
  { return ranges::size(*r_); }
}
```
constexpr auto data() const requires contiguous_range<R> {
    return ranges::data(*r_);
}
}
template<class R>
ref_view(R&) -> ref_view<R>;
}

template<not same as<ref_view> T>
requires see below
constexpr ref_view(T&& t);

Remarks: Let FUN denote the exposition-only functions

void FUN(R&);
void FUN(R&&) = delete;

The expression in the requires-clause is equivalent to

convertible_to<T, R&> && requires { FUN(declval<T>()); }

Effects: Initializes r_ with addressof(static_cast<R&>(std::forward<T>(t))).

24.7.4 Filter view

24.7.4.1 Overview

filter_view presents a view of the elements of an underlying sequence that satisfy a predicate.

The name views::filter denotes a range adaptor object (24.7.1). Given subexpressions E and P, the
expression views::filter(E, P) is expression-equivalent to filter_view{E, P}.

[Example:
vector<int> is{ 0, 1, 2, 3, 4, 5, 6 };
filter_view evens(is, [](int i) { return 0 == i % 2; });
for (int i : evens)
    cout << i << ' '; // prints: 0 2 4 6
—end example]

24.7.4.2 Class template filter_view

namespace std::ranges {
    template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
        requires view<V> && is_object_v<Pred>
    class filter_view : public view_interface<filter_view<V, Pred>> {
        private:
            V base_ = V(); // exposition only
            semiregular_box<Pred> pred_; // exposition only

            // 24.7.4.3, class filter_view::iterator
            class iterator;
            // exposition only
            // 24.7.4.4, class filter_view::sentinel
            class sentinel;
            // exposition only

        public:
            filter_view() = default;
            constexpr filter_view(V base, Pred pred);

            constexpr V base() const requires copy_constructible<V> {
                return base_; }
            constexpr V base() && {
                return std::move(base_); }

            constexpr const Pred& pred() const;

            constexpr iterator begin();
            constexpr auto end() {
                if constexpr (common_range<V>)
                    return iterator{this, ranges::end(base_)};
                else
                    return sentinel{*this};
            }

§ 24.7.4.2 ©ISO/IEC 2020 – All rights reserved 989
template<class R, class Pred>
    filter_view(R&&, Pred) -> filter_view<views::all_t<R>, Pred>;
}

constexpr filter_view(V base, Pred pred);  

Effects: Initializes base_ with std::move(base) and initializes pred_ with std::move(pred).

constexpr const Pred& pred() const;  

Effects: Equivalent to: return *pred_;

constexpr iterator begin();

Preconditions: pred_.has_value().

Returns: {*this, ranges::find_if(base_, ref(*pred_))}.

Remarks: In order to provide the amortized constant time complexity required by the range concept when filter_view models forward_range, this function caches the result within the filter_view for use on subsequent calls.

24.7.4.3 Class filter_view::iterator

namespace std::ranges {
    template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
        requires view<V> && is_object_v<Pred>
    class filter_view<V, Pred>::iterator {
        private:
            iterator_t<V> current_ = iterator_t<V>();  // exposition only
            filter_view* parent_ = nullptr;  // exposition only
        public:
            using iterator_concept = see below;
            using iterator_category = see below;
            using value_type = range_value_t<V>;
            using difference_type = range_difference_t<V>;
            iterator() = default;
            constexpr iterator(filter_view& parent, iterator_t<V> current);
            constexpr iterator_t<V> base() const &
                requires copyable<iterator_t<V>>;
            constexpr iterator_t<V> base() &&;
            constexpr range_reference_t<V> operator*() const;
            constexpr iterator_t<V> operator->() const
                    requires has-arrow<iterator_t<V>> && copyable<iterator_t<V>>;
            constexpr iterator& operator++();
            constexpr void operator++(int);
            constexpr iterator operator++(int) requires forward_range<V>;
            constexpr iterator& operator--() requires bidirectional_range<V>;
            constexpr iterator operator--(int) requires bidirectional_range<V>;
            friend constexpr bool operator==(const iterator& x, const iterator& y)
                    requires equality_comparable<iterator_t<V>>;
            friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
                    noexcept(ranges::iter_move(i.current_));
            friend constexpr void iter_swap(const iterator& x, const iterator& y)
                    noexcept(ranges::iter_swap(x.current_, y.current_))
                    requires indirectly_swappable<iterator_t<V>>;
    };
}
Modification of the element a filter_view::iterator denotes is permitted, but results in undefined behavior if the resulting value does not satisfy the filter predicate.

iterator::iterator_concept is defined as follows:

1. If V models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
2. Otherwise, if V models forward_range, then iterator_concept denotes forward_iterator_tag.
3. Otherwise, iterator_concept denotes input_iterator_tag.

iterator::iterator_category is defined as follows:

1. Let C denote the type iterator_traits<iterator_t<V>>::iterator_category.
2. If C models derived_from<bidirectional_iterator_tag>, then iterator_category denotes bidirectional_iterator_tag.
3. Otherwise, if C models derived_from<forward_iterator_tag>, then iterator_category denotes forward_iterator_tag.
4. Otherwise, iterator_category denotes C.

constexpr iterator(filter_view& parent, iterator_t<V> current);

Effects: Initializes current_ with std::move(current) and parent_ with addressof(parent).

constexpr iterator_t<V> base() const &
requires copyable<iterator_t<V>>;

Effects: Equivalent to: return current_;}

constexpr iterator_t<V> base() &&;

Effects: Equivalent to: return std::move(current_);

constexpr range_reference_t<V> operator*() const;

Effects: Equivalent to: return *current_;}

constexpr iterator_t<V> operator->() const
requires has-arrow<iterator_t<V>> && copyable<iterator_t<V>>;

Effects: Equivalent to: return current_;}

constexpr iterator& operator++();

Effects: Equivalent to:

    current_ = ranges::find_if(std::move(;++current_), ranges::end(parent_->base_),
                            ref(*parent_->pred_));

    return *this;

constexpr void operator++(int);

Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires forward_range<V>;

Effects: Equivalent to:

    auto tmp = *this;
    +++this;
    return tmp;

constexpr iterator& operator--() requires bidirectional_range<V>;

Effects: Equivalent to:

    do
      --current_;
    while (!invoke(*parent_->pred_, *current_));
    return *this;

constexpr iterator operator--(int) requires bidirectional_range<V>;

Effects: Equivalent to:
auto tmp = *this;
//--*this;
return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y) requires equality_comparable<iterator_t<V>>;
14  Effects: Equivalent to: return x.current_ == y.current_;

friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i) noexcept(noexcept(ranges::iter_move(i.current_))); 15  Effects: Equivalent to: return ranges::iter_move(i.current_);

friend constexpr void iter_swap(const iterator& x, const iterator& y) requires indirectly_swappable<iterator_t<V>>; 16  Effects: Equivalent to: ranges::iter_swap(x.current_, y.current_).

24.7.4.4 Class filter_view::sentinel

namespace std::ranges {
  template<input_range V, indirect unary predicate<iterator_t<V>> Pred>
  requires view<V> && is_object_v<Pred>
  class filter_view<V, Pred>::sentinel {
    private:
      sentinel_t<V> end_ = sentinel_t<V>();  // exposition only
    public:
      sentinel() = default;
      constexpr explicit sentinel(filter_view& parent);

      constexpr sentinel_t<V> base() const;
      friend constexpr bool operator==(const iterator& x, const sentinel& y);
    }
  }

1  Effects: Initializes end_ with ranges::end(parent.base_).

constexpr sentinel_t<V> base() const;
2  Effects: Equivalent to: return end_; 2

friend constexpr bool operator==(const iterator& x, const sentinel& y);
3  Effects: Equivalent to: return x.current_ == y.end_; 3

24.7.5 Transform view

24.7.5.1 Overview

transform_view presents a view of an underlying sequence after applying a transformation function to each element.

2  The name views::transform denotes a range adaptor object (24.7.1). Given subexpressions E and F, the expression views::transform(E, F) is expression-equivalent to transform_view{E, F}.

3  [Example:
   vector<int> is{ 0, 1, 2, 3, 4 };  
   transform_view squares(is, [](int i) { return i * i; });  
   for (int i : squares)  
     cout << i << ' '; // prints: 0 1 4 9 16  
   — end example]
24.7.5.2 Class template transform_view

```cpp
namespace std::ranges {
    template<input_range V, copy_constructible F>
    requires view<V> && is_object_v<F> && regular_invocable<F&, range_reference_t<V>> && can_reference<invoke_result_t<F&, range_reference_t<V>>>
    class transform_view : public view_interface<transform_view<V, F>> {
private:
    // 24.7.5.3, class template transform_view:::iterator
template<bool> struct iterator;
    // exposition only
    // 24.7.5.4, class template transform_view:::sentinel
template<bool> struct sentinel;
    // exposition only

    V base_ = V();
    // exposition only
    semiregular-box<F> fun_;
    // exposition only

public:
    transform_view() = default;
    constexpr transform_view(V base, F fun);

    constexpr V base() const requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr iterator<false> begin();
    constexpr iterator<true> begin() const requires range<const V> && regular_invocable<const F&, range_reference_t<const V>>;
    constexpr sentinel<false> end();
    constexpr iterator<false> end() requires common_range<V> && regular_invocable<const F&, range_reference_t<const V>>;
    constexpr sentinel<true> end() const requires range<const V> && regular_invocable<const F&, range_reference_t<const V>>;

    constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
    constexpr auto size() const requires sized_range<const V> { return ranges::size(base_); }

};

template<class R, class F>
transform_view(R&&, F) -> transform_view<views::all_t<R>, F>;
}
```

1. **Effects**: Initializes base_ with std::move(base) and fun_ with std::move(fun).

2. **Effects**: Equivalent to:
   ```cpp
   return iterator<false>{*this, ranges::begin(base_)};
   ```

3. **Effects**: Equivalent to:
   ```cpp
   return iterator<true>{*this, ranges::begin(base_)};
   ```

4. **Effects**: Equivalent to:
   ```cpp
   return sentinel<false> end();
   ```

24.7.6 Take view 

24.7.6.1 Overview 
1 take_view produces a view of the first N elements from another view, or all the elements if the adapted 
view contains fewer than N.

2 The name views::take denotes a range adaptor object (24.7.1). Let E and F be expressions, let T be remove_- 
cvref_t<decltype((E))>, and let D be range_difference_t<decltype((E))>. If decltype((F)) does not 
model convertible_to<D>, views::take(E, F) is ill-formed. Otherwise, the expression views::take(E, F) is expression-equivalent to:

(2.1) — If T is a specialization of ranges::empty_view (24.6.1.2), then ((void) F, decay-copy(E)).

(2.2) — Otherwise, if T models random_access_range and sized_range and is 
(2.2.1) — a specialization of span (22.7.3) where T::extent == dynamic_extent, 
(2.2.2) — a specialization of basic_string_view (21.4), 
(2.2.3) — a specialization of ranges::iota_view (24.6.3.2), or 
(2.2.4) — a specialization of ranges::subrange (24.5.3),

then T{ranges::begin(E), ranges::begin(E) + min<D>{ranges::size(E), F}}, except that E is 
evaluated only once.

(2.3) — Otherwise, ranges::take_view{E, F}.
3 [Example:
    vector<int> is{0,1,2,3,4,5,6,7,8,9};
    take_view few{is, 5};
    for (int i : few)
        cout << i << '
'; // prints: 0 1 2 3 4
    — end example]
24.7.6.2 Class template `take_view`
constexpr auto size() const requires sized_range<const V> {
    auto n = ranges::size(base_);
    return ranges::min(n, static_cast<decltype(n)>((count_));
};

template<range R>
take_view(R&&, range_difference_t<R>)
    -> take_view<views::all_t<R>>;

constexpr take_view(V base, range_difference_t<V> count);

1 Effects: Initializes base_ with std::move(base) and count_ with count.

24.7.6.3 Class template take_view::sentinel

namespace std::ranges {
    template<view V>
    template<bool Const>
    class take_view<V>::sentinel {
        private:
            using Base = conditional_t<Const, const V, V>; // exposition only
            using CI = counted_iterator<iterator_t<Base>>; // exposition only
            sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
        public:
            sentinel() = default;
            constexpr explicit sentinel(sentinel_t<Base> end);

                requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
            constexpr sentinel_t<Base> base() const;
        }
    }
    constexpr explicit sentinel(sentinel_t<Base> end);

1 Effects: Initializes end_ with end.

    constexpr sentinel(sentinel<!Const> s)
        requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
    2 Effects: Initializes end_ with std::move(s.end_).

    constexpr sentinel_t<Base> base() const;
    3 Effects: Equivalent to: return end_;

    friend constexpr bool operator==(const CI& y, const sentinel& x);
    4 Effects: Equivalent to: return y.count() == 0 || y.base() == x.end_;

24.7.7 Take while view

24.7.7.1 Overview

Given a unary predicate pred and a view r, take_while_view produces a view of the range [begin(r), ranges::find_if_not(r, pred)).

The name views::take_while denotes a range adaptor object (24.7.1). Given subexpressions E and F, the expression views::take_while(E, F) is expression-equivalent to take_while_view{E, F}.

[Example:
    auto input = istringstream{"0 1 2 3 4 5 6 7 8 9"};
    auto small = [] (const auto x) noexcept { return x < 5; };
    auto small_ints = istream_view<int>(input) | views::take_while(small);]
for (const auto i : small_ints) {
    cout << i << ' '; // prints 0 1 2 3 4
}  
auto i = 0;
input >> i;
cout << i; // prints 6
— end example]  

24.7.7.2 Class template take_while_view

namespace std::ranges {
    template<view V, class Pred>
    requires input_range<V> && is_object_v<Pred> &&
    indirect unary predicate<const Pred, iterator_t<V>>
    class take_while_view : public view_interface<take_while_view<V, Pred>> {  
    // 24.7.7.3, class template take_while_view::sentinel
    template<bool> class sentinel; // exposition only
    V base_ = V(); // exposition only
    semiregular box<Pred> pred_; // exposition only

    public:
    take_while_view() = default;
    constexpr take_while_view(V base, Pred pred);

    constexpr V base() const & requires copy constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr const Pred& pred() const;
    constexpr auto begin() requires (!simple_view<V>)
    { return ranges::begin(base_); }
    constexpr auto begin() const requires range<const V>
    { return ranges::begin(base_); }

    constexpr auto end() requires (!simple_view<V>)
    { return sentinel<false>(ranges::end(base_), addressof(*pred_)); }
    constexpr auto end() const requires range<const V>
    { return sentinel<true>(ranges::end(base_), addressof(*pred_)); }
    
    template<class R, class Pred>
    take_while_view(R&&, Pred) -> take_while_view<views::all_t<R>, Pred>;
}
}

template<class R, class Pred>
take_while_view(V base, Pred pred);  

1 Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).

constexpr const Pred& pred() const;

2 Effects: Equivalent to: return *pred_;  

24.7.7.3 Class template take_while_view::sentinel

namespace std::ranges {
    template<view V, class Pred>
    requires input_range<V> && is_object_v<Pred> &&
    indirect unary predicate<const Pred, iterator_t<V>>
    template<Bool Const>
    class take_while_view<V, Pred>::sentinel { // exposition only
    using Base = conditional_t<Const, const V, V>; // exposition only

§ 24.7.7.3 ©ISO/IEC 2020 – All rights reserved 1001
sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
const Pred* pred_ = nullptr; // exposition only

public:
    sentinel() = default;
    constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);
    constexpr sentinel(sentinel<!Const> s)
        requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
    constexpr sentinel_t<Base> base() const { return end_; }

friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);

1 Effects: Initializes end_ with end and pred_ with pred.

constexpr sentinel(sentinel<!Const> s)
    requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
2 Effects: Initializes end_ with s.end_ and pred_ with s.pred_.

friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);
3 Effects: Equivalent to: return y.end_ == x || !invoke(*y.pred_, *x);

24.7.8 Drop view [range.drop]
24.7.8.1 Overview [range.drop.overview]
drop_view produces a view excluding the first N elements from another view, or an empty range if the adapted view contains fewer than N elements.

The name views::drop denotes a range adaptor object (24.7.1). Let E and F be expressions, let T be remove_cvref_t<decltype((E))>, and let D be range_difference_t<decltype((E))>. If decltype((F)) does not model convertible_to<D>, views::drop(E, F) is ill-formed. Otherwise, the expression views::drop(E, F) is expression-equivalent to:

(2.1) — If T is a specialization of ranges::empty_view (24.6.1.2), then ((void) F, decay-copy(E)).
(2.2) — Otherwise, if T models random_access_range and sized_range and is
(2.2.1) — a specialization of span (22.7.3) where T::extent == dynamic_extent,
(2.2.2) — a specialization of basic_string_view (21.4),
(2.2.3) — a specialization of ranges::iota_view (24.6.3.2), or
(2.2.4) — a specialization of ranges::subrange (24.5.3),
then T{(ranges::begin(E) + min<D>(ranges::size(E), F), ranges::end(E))}, except that E is evaluated only once.
(2.3) — Otherwise, ranges::drop_view(E, F).

[Example:
auto ints = views::iota(0) | views::take(10);
auto latter_half = drop_view<ints, 5>;
for (auto i : latter_half) {
    cout << i << " "; // prints 5 6 7 8 9
}]

24.7.8.2 Class template drop_view [range.drop.view]
namespace std::ranges {
    template<view V>
    class drop_view : public view_interface<drop_view<V>> {
        public:
            drop_view() = default;
            constexpr drop_view(V base, range_difference_t<V> count);

§ 24.7.8.2 ©ISO/IEC 2020 – All rights reserved 1002
constexpr V base() const& requires copy_constructible<V> { return base_; }
constexpr V base() && { return std::move(base_); }

constexpr auto begin()
    requires (!simple_view<V> && random_access_range<V>)
{ return ranges::end(base_); }
constexpr auto begin() const
    requires range<const V>
{ return ranges::end(base_); }

constexpr auto end()
    requires (! simple_view<V>)
{ return ranges::end(base_); }
constexpr auto end() const
    requires range<const V>
{ return ranges::end(base_); }

constexpr auto size()
    requires sized_range<V>
{ const auto s = ranges::size(base_);
  const auto c = static_cast<decltype(s)> (count_);
  return s < c ? 0 : s - c;
}
constexpr auto size() const
    requires sized_range<const V>
{ const auto s = ranges::size(base_);
  const auto c = static_cast<decltype(s)> (count_);
  return s < c ? 0 : s - c;
}

private:
  V base_ = V(); // exposition only
  range_difference_t<V> count_ = 0; // exposition only
};

template<class R>
drop_view(R&&, range_difference_t<R>) -> drop_view<views::all_t<R>>;

constexpr drop_view(V base, range_difference_t<V> count);

  Preconditions: count >= 0 is true.

  Effects: Initializes base_ with std::move(base) and count_ with count.

constexpr auto begin()
    requires (!simple_view<V> && random_access_range<V>)
constexpr auto begin() const
    requires random_access_range<const V>
{ return ranges::next(ranges::begin(base_), count_, ranges::end(base_));

Returns: ranges::next(ranges::begin(base_), count_, ranges::end(base_)).

Remarks: In order to provide the amortized constant-time complexity required by the range concept when drop_view models forward_range, the first overload caches the result within the drop_view for use on subsequent calls. [Note: Without this, applying a reverse_view over a drop_view would have quadratic iteration complexity. —end note]

24.7.9 Drop while view

24.7.9.1 Overview

Given a unary predicate pred and a view r, drop_while_view produces a view of the range [ranges::find_if_not(r, pred), ranges::end(r)].

The name views::drop_while denotes a range adaptor object (24.7.1). Given subexpressions E and F, the expression views::drop_while(E, F) is expression-equivalent to drop_while_view{E, F}. 

§ 24.7.9.1 ©ISO/IEC 2020 – All rights reserved 1003
Example:

```cpp
constexpr auto source = " \t \t \t hello there";
auto is_invisible = [](const auto x) { return x == ' ' || x == '\t'; };
auto skip_ws = drop_while_view(source, is_invisible);
for (auto c : skip_ws) {
    cout << c;
    // prints hello there with no leading space
}
```

24.7.9.2 Class template `drop_while_view`

```cpp
namespace std::ranges {
    template<view V, class Pred>
    requires input_range<V> && is_object_v<Pred> &&
    indirect Unary_predicate<const Pred, iterator_t<V>>
    class drop_while_view : public view_interface<drop_while_view<V, Pred>> {
        public:
            drop_while_view() = default;
            constexpr drop_while_view(V base, Pred pred);
            constexpr V base() const& requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }
            constexpr const Pred& pred() const;
            constexpr auto begin();
            constexpr auto end() { return ranges::end(base_); }
        private:
            V base_ = V(); // exposition only
            semiregular_box<Pred> pred_; // exposition only
        }
    template<class R, class Pred>
    drop_while_view(R&&, Pred) -> drop_while_view<views::all_t<R>, Pred>;
}
```

- **Effects:** Initializes `base_` with `std::move(base)` and `pred_` with `std::move(pred)`.
- **Effects:** Equivalent to: `return *pred_`.
- **Returns:** `ranges::find_if_not(base_, cref(*pred_))`.

Remarks: In order to provide the amortized constant-time complexity required by the `range` concept when `drop_while_view` models `forward_range`, the first call caches the result within the `drop_while_view` for use on subsequent calls. [Note: Without this, applying a `reverse_view` over a `drop_while_view` would have quadratic iteration complexity. — end note]

24.7.10 Join view

24.7.10.1 Overview

`join_view` flattens a `view` of ranges into a `view`.

The name `views::join` denotes a range adaptor object (24.7.1). Given a subexpression `E`, the expression `views::join(E)` is expression-equivalent to `join_view(E)`.

Example:

```cpp
vector<string> ss{"hello", " ", "world", "!"};
join_view greeting(ss);
```
for (char ch : greeting)
    cout << ch; // prints: hello world!
—end example]

24.7.10.2 Class template join_view

namespace std::ranges {
    template<input_range V>
    requires view<V> && input_range<range_reference_t<V>> &&
        (is_reference_v<range_reference_t<V>> ||
        view<range_value_t<V>>)
    class join_view : public view_interface<join_view<V>> {
        private:
            using InnerRng = // exposition only
                range_reference_t<V>;
            // 24.7.10.3, class template join_view::iterator
            template<bool Const>
            struct iterator;
                // exposition only
            // 24.7.10.4, class template join_view::sentinel
            template<bool Const>
            struct sentinel;
                // exposition only
        V base_ = V(); // exposition only
        views::all_t<InnerRng> inner_ =  // exposition only, present only when !is_reference_v<InnerRng>
            views::all_t<InnerRng>();
        public:
            join_view() = default;
            constexpr explicit join_view(V base); // exposition only
            constexpr V base() const& requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }
            constexpr auto begin() {
                constexpr bool use_const = simple_view<V> &&
                    is_reference_v<range_reference_t<V>>;
                return iterator<use_const>{*this, ranges::begin(base_)};
            }
            constexpr auto begin() const requires input_range<const V> &&
                is_reference_v<range_reference_t<const V>> {
                return iterator<true>{*this, ranges::begin(base_)};
            }
            constexpr auto end() {
                if constexpr (forward_range<V> &&
                    is_reference_v<InnerRng> && forward_range<InnerRng> &&
                    common_range<V> && common_range<InnerRng>)
                    return iterator<simple_view<V>>{*this, ranges::end(base_)};
                else
                    return sentinel<simple_view<V>>{*this};
            }
            constexpr auto end() const requires input_range<const V> &&
                is_reference_v<range_reference_t<const V>> {
                if constexpr (forward_range<const V> &&
                    is_reference_v<range_reference_t<const V>> &&
                    forward_range<range_reference_t<const V>> &&
                    common_range<const V> &&
                    common_range<range_reference_t<const V>>)
                    return iterator<true>{*this, ranges::end(base_)};
                else
                    return sentinel<true>{*this};
    }
}
```cpp
template<class R>
explicit join_view(R&&) -> join_view<views::all_t<R>>;
}
constexpr explicit join_view(V base);

Effects: Initializes base_ with std::move(base).

### 24.7.10.3 Class template join_view::iterator
```
constexpr iterator operator--(int)  
requires ref-is-glvalue && bidirectional_range<Base> &&  
common_range<range_reference_t<Base>>;

friend constexpr bool operator==(const iterator& x, const iterator& y)  
requires ref-is-glvalue && equality_comparable<iterator_t<Base>> &&  
equality_comparable<iterator_t<range_reference_t<Base>>>;

friend constexpr decltype(auto) iter_move(const iterator& i)  
noexcept(noexcept(ranges::iter_move(i.inner_))) {
  return ranges::iter_move(i.inner_);
}

friend constexpr void iter_swap(const iterator& x, const iterator& y)  
noexcept(noexcept(ranges::iter_swap(x.inner_, y.inner_)));}

iterator::iterator_concept is defined as follows:
(1.1) — If ref-is-glvalue is true and Base and range_reference_t<Base> each model bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(1.2) — Otherwise, if ref-is-glvalue is true and Base and range_reference_t<Base> each model forward_range, then iterator_concept denotes forward_iterator_tag.
(1.3) — Otherwise, iterator_concept denotes input_iterator_tag.

iterator::iterator_category is defined as follows:
(2.1) — Let OUTFRC denote iterator_traits<iterator_t<Base>>::iterator_category, and let INNRC denote iterator_traits<iterator_t<range_reference_t<Base>>::iterator_category.
(2.2) — If ref-is-glvalue is true and OUTFRC and INNRC each model derived_from<bidirectional_iterator_tag>, iterator_category denotes bidirectional_iterator_tag.
(2.3) — Otherwise, if ref-is-glvalue is true and OUTFRC and INNRC each model derived_from<forward_iterator_tag>, iterator_category denotes forward_iterator_tag.
(2.4) — Otherwise, if OUTFRC and INNRC each model derived_from<input_iterator_tag>, iterator_category denotes input_iterator_tag.
(2.5) — Otherwise, iterator_category denotes output_iterator_tag.

iterator::difference_type denotes the type:
  
  common_type_t<
    range_difference_t<Base>,
    range_difference_t<range_reference_t<Base>>>

join_view iterators use the satisfy function to skip over empty inner ranges.

constexpr void satisfy();  // exposition only

Effects: Equivalent to:
  
  auto update_inner = [this](range_reference_t<Base> x) -> auto & {
    if constexpr (ref-is-glvalue) // x is a reference
      return x;
    else
      return (parent_→inner_ = views::all(std::move(x)));
  };

  for (; outer_ != ranges::end(parent_→base_); ++outer_) {
    auto & inner = update_inner(*outer_);
    inner_ = ranges::begin(inner);
    if (inner_ != ranges::end(inner))
      return;
  }

§ 24.7.10.3 ©ISO/IEC 2020 – All rights reserved 1007
if constexpr (ref-is-glvalue)
    inner_ = iterator_t<range_reference_t<Base>>()

constexpr iterator (Parent& parent, iterator_t<Base> outer);
6 Effects: Initializes outer_ with std::move(outer) and parent_ with addressof(parent); then calls satisfy().

constexpr iterator (iterator<Const> i)
    requires Const &&
        convertible_to<iterator_t<Outer>, iterator_t<Base>> &&
        convertible_to<iterator_t<InnerRng>,
            iterator_t<range_reference_t<Base>>>;
7 Effects: Initializes outer_ with std::move(i.outer_), inner_ with std::move(i.inner_), and parent_ with i.parent_.

constexpr iterator_t<Base> operator->() const
    requires has-arrow<iterator_t<Base>> && copyable<iterator_t<Base>>;

    requires ref-is-glvalue && bidirectional_range<Base> &&
        bidirectional_range<range_reference_t<Base>> &&
        common_range<range_reference_t<Base>>;
14 Effects: Equivalent to:
auto tmp = *this;
--*this;
return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y)
requires ref-is-glvalue && equality_comparable<iterator_t<Base>>,
equality_comparable<iterator_t<range_reference_t<Base>>>;

Effects: Equivalent to: return x.outer_ == y.outer_ && x.inner_ == y.inner_;

friend constexpr void iter_swap(const iterator& x, const iterator& y)
noexcept(noexcept(ranges::iter_swap(x.inner_, y.inner_)));

Effects: Equivalent to: return ranges::iter_swap(x.inner_, y.inner_);

24.7.10.4 Class template join_view::sentinel

namespace std::ranges {
  template<input_range V>
  requires view<V> && input_range<range_reference_t<V>> &&
  (is_reference_v<range_reference_t<V>> ||
   view<range_value_t<V>>) ||
  view<range_value_t<V>)
  template<bool Const>
  struct join_view<V>::sentinel {
    private:
      using Parent = conditional_t<Const, const join_view, join_view>;
      using Base = conditional_t<Const, const V, V>;
      sentinel_t<Base> end_ = sentinel_t<Base>();
    public:
      sentinel() = default;
      constexpr explicit sentinel(Parent& parent);
      constexpr sentinel(sentinel<!Const> s)
      requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
  };
}

constexpr explicit sentinel(Parent& parent);

Effects: Initializes end_ with ranges::end(parent.base_).

constexpr sentinel(sentinel<!Const> s)
requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

Effects: Initializes end_ with std::move(s.end_).

friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);

Effects: Equivalent to: return x.outer_ == y.end_;

24.7.11 Split view

24.7.11.1 Overview

split_view takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter can be a single element or a view of elements.

The name views::split denotes a range adaptor object (24.7.1). Given subexpressions E and F, the expression views::split(E, F) is expression-equivalent to split_view(E, F).

[Example:
  string str("the quick brown fox");
  split_view sentence(str, ' ');
  for (auto word : sentence) {
    for (char ch : word)
      cout << ch;
]
cout << ' * ';
} // The above prints: the * quick * brown * fox *
— end example]

24.7.11.2 Class template split_view

namespace std::ranges {
  template<auto> struct require-constant; // exposition only

template<class R>
  concept tiny-range = sized_range<R> &&
  requires { typename require-constant<remove_reference_t<R>::size>(); } &&
  (remove_reference_t<R>::size() <= 1);

template<input_range V, forward_range Pattern>
  requires view<V> && view<Pattern> &&
  indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
  (forward_range<V> || tiny-range<Pattern>)
  class split_view : public view_interface<split_view<V, Pattern>> {
private:
  V base_ = V(); // exposition only
  Pattern pattern_ = Pattern(); // exposition only
  iterator_t<V> current_ = iterator_t<V>(); // exposition only, present only if !forward_range<V>

  // 24.7.11.3, class template split_view::outer-iterator
  template<bool> struct outer-iterator {
    // exposition only
  };

  // 24.7.11.5, class template split_view::inner-iterator
  template<bool> struct inner-iterator {
    // exposition only
  };

public:
  split_view() = default;
  constexpr split_view(V base, Pattern pattern);

  template<input_range R>
  requires constructible_from<V, views::all_t<R>> &&
  constructible_from<Pattern, single_view<range_value_t<R>>>
  constexpr split_view(R&& r, range_value_t<R> e);

  constexpr V base() const& requires copy_constructible<V> { return base_; }
  constexpr V base() && { return std::move(base_); }

  constexpr auto begin() {
    if constexpr (forward_range<V>)
      return outer-iterator<simple-view<V>>{*this, ranges::begin(base_)};
    else {
      current_ = ranges::begin(base_);
      return outer-iterator<false>{*this};
    }
  }

  constexpr auto begin() const requires forward_range<V> && forward_range<const V> {
    return outer-iterator<true>{*this, ranges::begin(base_)};
  }

  constexpr auto end() requires forward_range<V> && common_range<V> {
    return outer-iterator<true>{*this, ranges::end(base_)};
  }

  constexpr auto end() const {
    if constexpr (forward_range<V> && forward_range<const V> && common_range<const V>)
      return outer-iterator<true>{*this, ranges::end(base_)};
    else
      return default_sentinel;
  }
};

template<input_range R>
split_view(R&&, range_value_t<R>)
   -> split_view<views::all_t<R>, single_view<range_value_t<R>>>;

constexpr split_view(V base, Pattern pattern);

Effects: Initializes base_ with std::move(base), and pattern_ with std::move(pattern).

template<input_range R>
requires constructible_from<V, views::all_t<R>> &&
constructible_from<Pattern, single_view<range_value_t<R>>>&&
constexpr split_view(R&& r, range_value_t<R> e);

Effects: Initializes base_ with views::all(std::forward<R>(r)), and pattern_ with single_view{
   std::move(e)}.

### § 24.7.11.3 Class template split_view::outer_iterator

```cpp
namespace std::ranges {
    template<input_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
        indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
        (forward_range<V> || tiny-range<Pattern>)
    template<bool Const>
    struct split_view<V, Pattern>::outer_iterator {
        private:
            using Parent  = // exposition only
               conditional_t<Const, const split_view, split_view>;
            using Base    = // exposition only
               conditional_t<Const, const V, V>;
        Parent* parent_ = nullptr; // exposition only
        iterator_t<Base> current_ = // exposition only, present only if V models forward_range
           iterator_t<Base>();

        public:
            using iterator_concept = // 24.7.11.4, class split_view::outer_iterator::value_type
               conditional_t<forward_range<Base>, forward_iterator_tag, input_iterator_tag>;
            using iterator_category = input_iterator_tag;
            // 24.7.11.4, class split_view::outer_iterator::value_type
               struct value_type;
            using difference_type = range_difference_t<Base>;

            outer_iterator() = default;
            constexpr explicit outer_iterator(Parent& parent)
               requires (forward_range<Base>);
            constexpr outer_iterator(Parent& parent, iterator_t<Base> current)
               requires forward_range<Base>;
            constexpr outer_iterator(outter_iterator<!Const> i)
               requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

            constexpr value_type operator*() const;
            constexpr outer_iterator& operator++();
            constexpr decltype(auto) operator++(int) {
                if constexpr (forward_range<Base>) {
                    auto tmp = *this;
                    +++this;
                    return tmp;
                } else
                    +++this;
```
friend constexpr bool operator==(const outer-iterator& x, const outer-iterator& y) 
  requires forward_range<Base>;

friend constexpr bool operator==(const outer-iterator& x, default_sentinel_t);

Many of the following specifications refer to the notional member `current` of `outer_iterator`. `current` is equivalent to `current_` if `V` models `forward_range`, and `parent_`->`current_` otherwise.

constexpr explicit outer-iterator(Parent& parent) 
  requires (!forward_range<Base>);

Effects: Initializes `parent_` with `addressof(parent)`.

constexpr outer-iterator(Parent& parent, iterator_t<Base> current) 
  requires forward_range<Base>;

Effects: Initializes `parent_` with `addressof(parent)` and `current_` with `std::move(current)`.

constexpr outer-iterator(outer-iterator<!Const> i) 
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

Effects: Initializes `parent_` with `i.parent_` and `current_` with `std::move(i.current_)`.

constexpr value_type operator*() const;

Effects: Equivalent to: `return value_type{*this};`

constexpr outer-iterator& operator++();

Effects: Equivalent to:
  const auto end = ranges::end(parent_)->base_; 
  if (current == end) return *this; 
  const auto [pbegin, pend] = subrange{parent_->pattern_}; 
  if (pbegin == pend) ++current; 
  else { 
    do { 
      auto [b, p] = ranges::mismatch(std::move(current), end, pbegin, pend); 
      current = std::move(b); 
      if (p == pend) { 
        break; // The pattern matched; skip it 
      } 
    } while (++current != end); 
  } 
  return *this;

friend constexpr bool operator==(const outer-iterator& x, const outer-iterator& y) 
  requires forward_range<Base>;

Effects: Equivalent to: `return x.current_ == y.current_`;

friend constexpr bool operator==(const outer-iterator& x, default_sentinel_t);

Effects: Equivalent to: `return x.current_ == ranges::end(x.parent_->base_)`;

### 24.7.11.4 Class `split_view::outer-iterator::value_type`  

namespace std::ranges {
    template<input_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
    indirectly_comparable<iterator_t<V>, iterator_t<Pattern>>, ranges::equal_to &&
    (forward_range<V> || tiny-range<Pattern>)
    template<Bool Const>
    struct split_view<V, Pattern>::outer-iterator<Const>::value_type :
    view_interface<value_type> {
        private:
        outer-iterator i_ = outer-iterator();    // exposition only
    }
}
public:
    value_type() = default;
    constexpr explicit value_type(outer_iterator i);

    constexpr inner_iterator<Const> begin() const requires copyable<outer_iterator>;
    constexpr inner_iterator<Const> begin() requires (!copyable<outer_iterator>);
    constexpr default_sentinel_t end() const;
};

constexpr explicit value_type(outer_iterator i);

Effects: Initializes i with std::move(i).

constexpr inner_iterator<Const> begin() const requires copyable<outer_iterator>;
Effects: Equivalent to: return inner_iterator<Const>{i_};

constexpr inner_iterator<Const> begin() requires (!copyable<outer_iterator>);
Effects: Equivalent to: return inner_iterator<Const>{std::move(i_)};

constexpr default_sentinel_t end() const;
Effects: Equivalent to: return default_sentinel;

24.7.11.5 Class template split_view::inner_iterator

namespace std::ranges {
    template<input_range V, forward_range Pattern>
        requires view<V> && view<Pattern> &&
            indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&

friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y)
    noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
    requires indirectly_swappable<iterator_t<Base>>;

6 Effects: Equivalent to ranges::iter_swap(x.i_.current, y.i_.current).

24.7.12 Counted view

A counted view presents a view of the elements of the counted range (23.3.1) \(i + [0, n)\) for an iterator \(i\) and non-negative integer \(n\).
The name `views::counted` denotes a customization point object (16.4.2.2.6). Let \( E \) and \( F \) be expressions, let \( T \) be `decay_t<decltype((E))>` and let \( D \) be `iter_difference_t<T>`. If `decltype((F))` does not model `convertible_to<D>`, `views::counted(E, F)` is ill-formed. [Note: This case can result in substitution failure when `views::counted(E, F)` appears in the immediate context of a template instantiation. — end note] Otherwise, `views::counted(E, F)` is expression-equivalent to:

1. If \( T \) models `contiguous_iterator`, then `span(to_address(E), static_cast<D>(F))`.
2. Otherwise, if \( T \) models `random_access_iterator`, then `subrange(E, E + static_cast<D>(F))`, except that \( E \) is evaluated only once.
3. Otherwise, `subrange(counted_iterator(E, F), default_sentinel)`.

24.7.13 Common view

24.7.13.1 Overview

`common_view` takes a `view` which has different types for its iterator and sentinel and turns it into a `view` of the same elements with an iterator and sentinel of the same type.

[Note: `common_view` is useful for calling legacy algorithms that expect a range’s iterator and sentinel types to be the same. — end note]

The name `views::common` denotes a range adaptor object (24.7.1). Given a subexpression \( E \), the expression `views::common(E)` is expression-equivalent to:

1. `views::all(E)`, if `decltype((E))` models `common_range` and `views::all(E)` is a well-formed expression.
2. Otherwise, `common_view{E}`.

[Example:

```cpp
// Legacy algorithm:
template<class ForwardIterator>
size_t count(ForwardIterator first, ForwardIterator last);

template<forward_range R>
void my_algo(R&& r) {
    auto&& common = common_view{r};
    auto cnt = count(common.begin(), common.end());
    // ...
}
```

— end example]

24.7.13.2 Class template common_view

```cpp
namespace std::ranges {
    template<view V>
    requires (!common_range<V> && copyable<iterator_t<V>>)
    class common_view : public view_interface<common_view<V>> {
        private:
            V base_ = V(); // exposition only
        public:
            common_view() = default;
            constexpr explicit common_view(V r) {
                base_ = r;
            }
            constexpr auto begin() {
                if constexpr (random_access_range<V> && sized_range<V>)
                    return ranges::begin(base_);
            }
    };
}
```
else
  return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::begin(base_));

constexpr auto begin() const requires range<const V> {
  if constexpr (random_access_range<const V> && sized_range<const V>)
    return ranges::begin(base_);
  else
    return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::begin(base_));
}

constexpr auto end() {
  if constexpr (random_access_range<V> && sized_range<V>)
    return ranges::begin(base_) + ranges::size(base_);
  else
    return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::end(base_));
}

constexpr auto end() const requires range<const V> {
  if constexpr (random_access_range<const V> && sized_range<const V>)
    return ranges::begin(base_) + ranges::size(base_);
  else
    return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::end(base_));
}

constexpr auto size() requires sized_range<V> {
  return ranges::size(base_);
}

constexpr auto size() const requires sized_range<const V> {
  return ranges::size(base_);
}

template<class R>
common_view(R&&) -> common_view<views::all_t<R>>;

constexpr explicit common_view(V base);

Effects: Initializes base_ with std::move(base).

template<viewable_range R>
requires (!common_range<R> && constructible_from<V, views::all_t<R>>)
constexpr explicit common_view(R&& r);

Effects: Initializes base_ with views::all(std::forward<R>(r)).

### 24.7.14 Reverse view

#### [range.reverse]

#### 24.7.14.1 Overview

reverse_view takes a bidirectional view and produces another view that iterates the same elements in reverse order.

The name views::reverse denotes a range adaptor object (24.7.1). Given a subexpression E, the expression views::reverse(E) is expression-equivalent to:

1. If the type of E is a (possibly cv-qualified) specialization of reverse_view, equivalent to E.base().
2. Otherwise, if the type of E is cv-qualified
   subrange<reverse_iterator<I>, reverse_iterator<I>, K>
   for some iterator type I and value K of type subrange_kind,
   
   1. if K is subrange_kind::sized, equivalent to:
      subrange<I, I, K>(E.end().base(), E.begin().base(), E.size())
   2. otherwise, equivalent to:
subrange<
$I$, $I$, $K>$(E.end().base(), E.begin().base())

However, in either case $E$ is evaluated only once.

(2.3) Otherwise, equivalent to $\text{reverse\_view}(E)$.

3 [Example:

vector<int> is {0,1,2,3,4};
reverse_view rv {is};
for (int i : rv)
  cout << i << ' '; // prints: 4 3 2 1 0
— end example]

24.7.14.2 Class template reverse_view

namespace std::ranges {

  template<view V> requires bidirectional_range<V>
  class reverse_view : public view_interface<reverse_view<V>> {
    private:
      V base_ = V(); // exposition only
    public:
      reverse_view() = default;

      constexpr explicit reverse_view(V r);

      constexpr V base() const
        requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

      constexpr reverse_iterator<iterator_t<V>> begin();
    constexpr reverse_iterator<iterator_t<V>> begin()
      requires common_range<V>;
    constexpr auto begin() const requires common_range<const V>;

      constexpr reverse_iterator<iterator_t<V>> end();
    constexpr auto end() const requires common_range<const V>;

      constexpr auto size() requires sized_range<V> {
        return ranges::size(base_); }
    constexpr auto size() const requires sized_range<const V> {
        return ranges::size(base_); }
  };

  template<class R>
  reverse_view(R&&) -> reverse_view<views::all_t<R>>;

  constexpr explicit reverse_view(V base);

  Effects: Initializes $\text{base\_}$ with $\text{std::move(base)}$.

  constexpr reverse_iterator<iterator_t<V>> begin();
  Returns:

  make_reverse_iterator(ranges::next(ranges::begin(base_), ranges::end(base_)))

  Remarks: In order to provide the amortized constant time complexity required by the $\text{range}$ concept,
  this function caches the result within the $\text{reverse\_view}$ for use on subsequent calls.

  constexpr reverse_iterator<iterator_t<V>> begin()
    requires common_range<V>;
  constexpr auto begin() const
    requires common_range<const V>;

  Effects: Equivalent to: $\text{return make_reverse\_iterator(ranges::end(base\_)})$.

  constexpr reverse_iterator<iterator_t<V>> end();

};
constexpr auto end() const requires common_range<const V>;  

Effects: Equivalent to: return make_reverse_iterator(ranges::begin(base_));

24.7.15 Elements view

24.7.15.1 Overview

elements_view takes a view of tuple-like values and a size_t, and produces a view with a value-type of the N\textsuperscript{th} element of the adapted view's value-type.

The name views::elements<N> denotes a range adaptor object (24.7.1). Given a subexpression E and constant expression N, the expression views::elements<N>(E) is expression-equivalent to elements_view<views::all_t<decltype((E))>, N>{E}.

[Example:  
auto historical_figures = map{
    {"Lovelace"sv, 1815},
    {"Turing"sv, 1912},
    {"Babbage"sv, 1791},
    {"Hamilton"sv, 1936}
};  

auto names = historical_figures | views::elements<0>;  
for (auto& name : names) {
    cout << name << ' ';  
}  // prints Babbage Hamilton Lovelace Turing

auto birth_years = historical_figures | views::elements<1>;  
for (auto& born : birth_years) {
    cout << born << ' ';  
}  // prints 1791 1936 1815 1912

—end example]

keys_view is an alias for elements_view<views::all_t<R>, 0>, and is useful for extracting keys from associative containers.

[Example:  
auto names = keys_view(historical_figures);  
for (auto& name : names) {
    cout << name << ' ';  
}  // prints Babbage Hamilton Lovelace Turing

—end example]

values_view is an alias for elements_view<views::all_t<R>, 1>, and is useful for extracting values from associative containers.

[Example:  
auto is_even = [](const auto x) { return x \% 2 == 0; };  
cout << ranges::count_if(values_view<historical_figures>, is_even);  // prints 2

—end example]

24.7.15.2 Class template elements_view

namespace std::ranges {
    template<class T, size_t N>
    concept has-tuple-element =  
        // exposition only
        requires(T t) {
            typename tuple_size<T>::type;
            requires N < tuple_size_v<T>;
            typename tuple_element_t<N, T>;
            { get<N>(t) } -> convertible_to<
                const tuple_element_t<N, T>&;};
    }
template<input_range V, size_t N>
  requires view<V> && has-tuple-element<range_value_t<V>, N> &&
  has-tuple-element<remove_reference_t<range_reference_t<V>>, N>
class elements_view : public view_interface<elements_view<V, N>> {
  public:
    elements_view() = default;
    constexpr explicit elements_view(V base);  
  
    constexpr V base() const requires copy_constructible<V> { return base_; }

25 Algorithms library

25.1 General

This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 22) and other sequences.

The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 91.

25.2 Algorithms requirements

All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.

The entities defined in the std::ranges namespace in this Clause are not found by argument-dependent name lookup (6.5.2). When found by unqualified (6.5.1) name lookup for the postfix-expression in a function call (7.6.1.2), they inhibit argument-dependent name lookup.

Example:

```cpp
void foo() {
  using namespace std::ranges;
  std::vector<int> vec{1,2,3};
  find(begin(vec), end(vec), 2);  // #1
}
```

The function call expression at #1 invokes std::ranges::find, not std::find, despite that (a) the iterator type returned from begin(vec) and end(vec) may be associated with namespace std and (b) std::find is more specialized (13.7.6.2) than std::ranges::find since the former requires its first two parameters to have the same type. — end example]

For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.

Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.

(4.1) If an algorithm’s template parameter is named InputIterator, InputIterator1, or InputIterator2, the template argument shall meet the Cpp17InputIterator requirements (23.3.5.2).

(4.2) If an algorithm’s template parameter is named OutputIterator, OutputIterator1, or OutputIterator2, the template argument shall meet the Cpp17OutputIterator requirements (23.3.5.3).

(4.3) If an algorithm’s template parameter is named ForwardIterator, ForwardIterator1, or ForwardIterator2, the template argument shall meet the Cpp17ForwardIterator requirements (23.3.5.4).

(4.4) If an algorithm’s template parameter is named NoThrowForwardIterator, the template argument shall meet the Cpp17ForwardIterator requirements (23.3.5.4), and is required to have the property that no
If an algorithm’s template parameter is named `BidirectionalIterator`, `BidirectionalIterator1`, or `BidirectionalIterator2`, the template argument shall meet the `Cpp17BidirectionalIterator` requirements (23.3.5.5).

If an algorithm’s template parameter is named `RandomAccessIterator`, `RandomAccessIterator1`, or `RandomAccessIterator2`, the template argument shall meet the `Cpp17RandomAccessIterator` requirements (23.3.5.6).

5 If an algorithm’s Effects: element specifies that a value pointed to by any iterator passed as an argument is modified, then that algorithm has an additional type requirement: The type of that argument shall meet the requirements of a mutable iterator (23.3). [Note: This requirement does not affect arguments that are named `OutputIterator`, `OutputIterator1`, or `OutputIterator2`, because output iterators must always be mutable, nor does it affect arguments that are constrained, for which mutability requirements are expressed explicitly. —end note]

6 Both in-place and copying versions are provided for certain algorithms.230 When such a version is provided for `algorithm` it is called `algorithm_copy`. Algorithms that take predicates end with the suffix `_if` (which follows the suffix `_copy`).

7 When not otherwise constrained, the `Predicate` parameter is used whenever an algorithm expects a function object (20.14) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as `true`. In other words, if an algorithm takes `Predicate pred` as its argument and `first` as its iterator argument with value type `T`, it should work correctly in the construct `pred(*first)` contextually converted to `bool` (7.3). The function object `pred` shall not apply any non-constant function through the dereferenced iterator. Given a glvalue `u` of type (possibly `const`) `T` that designates the same object as `*first`, `pred(u)` shall be a valid expression that is equal to `pred(*first)`.

8 When not otherwise constrained, the `BinaryPredicate` parameter is used whenever an algorithm expects a function object that when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type `T` when `T` is part of the signature returns a value testable as `true`. In other words, if an algorithm takes `BinaryPredicate binary_pred` as its argument and `first1` and `first2` as its iterator arguments with respective value types `T1` and `T2`, it should work correctly in the construct `binary_pred(*first1, *first2)` contextually converted to `bool` (7.3). Unless otherwise specified, `BinaryPredicate` always takes the first iterator’s `value_type` as its first argument, that is, in those cases when `T value` is part of the signature, it should work correctly in the construct `binary_pred(*first1, value)` contextually converted to `bool` (7.3). `binary_pred` shall not apply any non-constant function through the dereferenced iterators. Given a glvalue `u` of type (possibly `const`) `T` that designates the same object as `*first1`, and a glvalue `v` of type (possibly `const`) `T2` that designates the same object as `*first2`, `binary_pred(u, *first2)`, `binary_pred(*first1, v)`, and `binary_pred(u, v)` shall each be a valid expression that is equal to `binary_pred(*first1, *first2)`, and `binary_pred(u, value)` shall be a valid expression that is equal to `binary_pred(*first1, value)`.

9 The parameters `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, and `BinaryOperation2` are used whenever an algorithm expects a function object (20.14).

[Note: Unless otherwise specified, algorithms that take function objects as arguments are permitted to copy those function objects freely. Programmers for whom object identity is important should consider using a wrapper class that points to a noncopied implementation object such as `reference_wrapper<T>` (20.14.5), or some equivalent solution. —end note]

10 When the description of an algorithm gives an expression such as `*first == value` for a condition, the expression shall evaluate to either `true` or `false` in boolean contexts.

11 In the description of the algorithms, operator `*` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as those of

```c++
auto tmp = a;
for (; n < 0; ++n) --tmp;
for (; n > 0; --n) ++tmp;
return tmp;
```

230 The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, `sort_copy` is not included because the cost of sorting is much more significant, and users might as well do `copy` followed by `sort`. 

§ 25.2 ©ISO/IEC 2020 – All rights reserved 1025
Similarly, operator - is used for some combinations of iterators and sentinel types for which it does not have to be defined. If \([a, b)\) denotes a range, the semantics of \(b - a\) in these cases are the same as those of

\[
\text{iter_difference_t<decltype(a)> n = 0;}
\]

\[
\text{for (auto tmp = a; tmp != b; ++tmp) ++n; return n;}
\]

and if \([b, a)\) denotes a range, the same as those of

\[
\text{iter_difference_t<decltype(b)> n = 0;}
\]

\[
\text{for (auto tmp = b; tmp != a; ++tmp) --n; return n;}
\]

In the description of algorithm return values, a sentinel value \(s\) denoting the end of a range \([i, s)\) is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using \text{ranges::next}(i, s).

Overloads of algorithms that take \text{range} arguments (24.4.2) behave as if they are implemented by calling \text{ranges::begin} and \text{ranges::end} on the \text{range}(s) and dispatching to the overload in namespace \text{ranges} that takes separate iterator and sentinel arguments.

The number and order of deducible template parameters for algorithm declarations are unspecified, except where explicitly stated otherwise. \[\text{Note: Consequently, the algorithms may not be called with explicitly-specified template argument lists.} \]

25.3 Parallel algorithms

25.3.1 Preamble

Subclause 25.3 describes components that C++ programs may use to perform operations on containers and other sequences in parallel.

A parallel algorithm is a function template listed in this document with a template parameter named \text{ExecutionPolicy}.

Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:

1. All operations of the categories of the iterators that the algorithm is instantiated with.
2. Operations on those sequence elements that are required by its specification.
3. User-provided function objects to be applied during the execution of the algorithm, if required by the specification.
4. Operations on those function objects required by the specification. \[\text{Note: See 25.2.} \]

These functions are herein called \text{element access functions}. \[\text{Example: The sort function may invoke the following element access functions:} \]

1. Operations of the random-access iterator of the actual template argument (as per 23.3.5.6), as implied by the name of the template parameter \text{RandomAccessIterator}.
2. The \text{swap} function on the elements of the sequence (as per the preconditions specified in 25.8.1.1).
3. The user-provided \text{Compare} function object.

A standard library function is \text{vectorization-unsafe} if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function. \[\text{Note: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees.} \]

```cpp
int x = 0;
std::mutex m;
void f() {
    int a[] = {1,2};
    std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [&] (int) {
        std::lock_guard<mutex> guard(m); // incorrect: lock_guard constructor calls m.lock()
        ++x;
    });
}
```

§ 25.3.1 ©ISO/IEC 2020 – All rights reserved 1026
The above program may result in two consecutive calls to m.lock() on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution. — end example

25.3.2 Requirements on user-provided function objects

Unless otherwise specified, function objects passed into parallel algorithms as objects of type Predicate, BinaryPredicate, Compare, UnaryOperation, BinaryOperation, BinaryOperation1, BinaryOperation2, and the operators used by the analogous overloads to these parallel algorithms that could be formed by the invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

25.3.3 Effect of execution policies on algorithm execution

Parallel algorithms have template parameters named ExecutionPolicy (20.18) which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.

1 If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object. [Note: For example, swap, ++, --, *=, and assignments modify the object. For the assignment and *= operators, only the left argument is modified. — end note]

2 Unless otherwise stated, implementations may make arbitrary copies of elements (with type T) from sequences where is_trivially_copy_constructible_v<T> and is_trivially_destructible_v<T> are true. [Note: This implies that user-supplied function objects should not rely on object identity of arguments for such input sequences. Users for whom the object identity of the arguments to these function objects is important should consider using a wrapping iterator that returns a non-copied implementation object such as reference_wrapper<T> (20.14.5) or some equivalent solution. — end note]

3 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type execution::sequenced_policy all occur in the calling thread of execution. [Note: The invocations are not interleaved; see 6.9.1. — end note]

4 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type execution::unsequenced_policy are permitted to execute in an unordered fashion in the calling thread of execution, unsequenced with respect to one another in the calling thread of execution. [Note: This means that multiple function object invocations may be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — end note] The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a execution::unsequenced_policy algorithm. [Note: Because execution::unsequenced_policy allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — end note]

5 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type execution::parallel_policy are permitted to execute either in the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by thread (32.4.2) or jthread (32.4.3) provide concurrent forward progress guarantees (6.9.2.2), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other. [Note: It is the caller’s responsibility to ensure that the invocation does not introduce data races or deadlocks. — end note] [Example:

```cpp
int a[] = {0,1};
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
    v.push_back(i*2+1);
    // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container v. — end example]

6 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type execution::structured_policy are permitted to execute either in the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by thread (32.4.2) or jthread (32.4.3) provide concurrent forward progress guarantees (6.9.2.2), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other. [Note: It is the caller’s responsibility to ensure that the invocation does not introduce data races or deadlocks. — end note] [Example:

```cpp
std::atomic<int> x{0};
int a[] = {1,2};
```
The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution. — end example] [Example:

```cpp
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&]() { ++x; });
```

The above example synchronizes access to object `x` ensuring that it is incremented correctly. — end example]

7 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_unsequenced_policy` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees. [Note: This means that multiple function object invocations may be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — end note] The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a `execution::parallel_unsequenced_policy` algorithm. [Note: Because `execution::parallel_unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — end note]

8 [Note: The semantics of invocation with `execution::unsequenced_policy`, `execution::parallel_policy`, or `execution::parallel_unsequenced_policy` allow the implementation to fall back to sequential execution if the system cannot parallelize an algorithm invocation, e.g., due to lack of resources. — end note]

9 If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either

9.1 temporarily block with forward progress guarantee delegation (6.9.2.2) on the completion of these library-managed threads of execution, or

9.2 eventually execute an element access function;

the thread of execution will continue to do so until the algorithm is finished. [Note: In blocking with forward progress guarantee delegation in this context, a thread of execution created by the library is considered to have finished execution as soon as it has finished the execution of the particular element access function that the invoking thread of execution logically depends on. — end note]

10 The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.

25.3.4 Parallel algorithm exceptions [algorithms.parallel.exceptions]

1 During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a `bad_alloc` exception.

2 During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the `ExecutionPolicy`.

25.3.5 ExecutionPolicy algorithm overloads [algorithms.parallel.overloads]

1 Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named `ExecutionPolicy`, which is the first template parameter. Additionally, each parallel algorithm overload has an additional function parameter of type `ExecutionPolicy&&`, which is the first function parameter. [Note: Not all algorithms have parallel algorithm overloads. — end note]

2 Unless otherwise specified, the semantics of `ExecutionPolicy` algorithm overloads are identical to their overloads without.
Unless otherwise specified, the complexity requirements of `ExecutionPolicy` algorithm overloads are relaxed from the complexity requirements of the overloads without as follows: when the guarantee says “at most `expr`” or “exactly `expr`” and does not specify the number of assignments or swaps, and `expr` is not already expressed with $O()$ notation, the complexity of the algorithm shall be $O(expr)$.

Parallel algorithms shall not participate in overload resolution unless `is_execution_policy_v<remove_cvref_t<ExecutionPolicy>>` is true.

requires convertible_to<const I&, I2>
constexpr operator in_found_result<I2>() const & {
    return {in, found};
}

25.6  Non-modifying sequence operations  [alg.nonmodifying]
25.6.1  All of  [alg.all.of]

template<class InputIterator, class Predicate>
constexpr bool all_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool all_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::all_of(I first, S last, Pred pred, Proj proj = {});

template<input_range R, class Proj = identity,
indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::all_of(R&& r, Pred pred, Proj proj = {});

Let \( E \) be:
1. \( \text{pred(*i)} \) for the overloads in namespace \( \text{std} \);
2. \( \text{invoke(pred, invoke(proj, *i))} \) for the overloads in namespace \( \text{ranges} \).

Returns: \text{false} if \( E \) is \text{false} for some iterator \( i \) in the range \( [\text{first}, \text{last}) \), and \text{true} otherwise.

Complexity: At most \( \text{last - first} \) applications of the predicate and any projection.

25.6.2 Any of

template<class InputIterator, class Predicate>
constexpr bool any_of(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool any_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::any_of(I first, S last, Pred pred, Proj proj = {});

template<input_range R, class Proj = identity,
indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::any_of(R&& r, Pred pred, Proj proj = {});

Let \( E \) be:
1. \( \text{pred(*i)} \) for the overloads in namespace \( \text{std} \);
2. \( \text{invoke(pred, invoke(proj, *i))} \) for the overloads in namespace \( \text{ranges} \).

Returns: \text{true} if \( E \) is \text{true} for some iterator \( i \) in the range \( [\text{first}, \text{last}) \), and \text{false} otherwise.

Complexity: At most \( \text{last - first} \) applications of the predicate and any projection.

25.6.3 None of

template<class InputIterator, class Predicate>
constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool none_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::none_of(I first, S last, Pred pred, Proj proj = {});

template<input_range R, class Proj = identity,
indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::none_of(R&& r, Pred pred, Proj proj = {});

Let \( E \) be:
1. \( \text{pred(*i)} \) for the overloads in namespace \( \text{std} \);
2. \( \text{invoke(pred, invoke(proj, *i))} \) for the overloads in namespace \( \text{ranges} \).

Returns: \text{false} if \( E \) is \text{true} for some iterator \( i \) in the range \( [\text{first}, \text{last}) \), and \text{true} otherwise.

Complexity: At most \( \text{last - first} \) applications of the predicate and any projection.
25.6.4 For each

```cpp
template<class InputIterator, class Function>
constexpr Function for_each(InputIterator first, InputIterator last, Function f);
```

1. Preconditions: Function meets the Cpp17MoveConstructible requirements (Table 28). [Note: Function need not meet the requirements of Cpp17CopyConstructible (Table 29). — end note]
2. Effects: Applies f to the result of dereferencing every iterator in the range [first, last), starting from first and proceeding to last - 1. [Note: If the type of first meets the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator. — end note]
5. Remarks: If f returns a result, the result is ignored.

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Function>
void for_each(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last,
Function f);
```

6. Preconditions: Function meets the Cpp17CopyConstructible requirements.
7. Effects: Applies f to the result of dereferencing every iterator in the range [first, last). [Note: If the type of first meets the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator. — end note]
8. Complexity: Applies f exactly last - first times.
9. Remarks: If f returns a result, the result is ignored. Implementations do not have the freedom granted under 25.3.3 to make arbitrary copies of elements from the input sequence.

[Note: Does not return a copy of its Function parameter, since parallelization may not permit efficient state accumulation. — end note]

```cpp
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
indirectly unary invocable<projected<I, Proj>> Fun>
constexpr ranges::for_each_result<I, Fun>
ranges::for_each(I first, S last, Fun f, Proj proj = {});
```

11. Effects: Calls invoke(f, invoke(proj, *i)) for every iterator i in the range [first, last), starting from first and proceeding to last - 1. [Note: If the result of invoke(proj, *i) is a mutable reference, f may apply non-constant functions. — end note]
12. Returns: {last, std::move(f)}.
13. Complexity: Applies f and proj exactly last - first times.
14. Remarks: If f returns a result, the result is ignored.
15. [Note: The overloads in namespace ranges require Fun to model copy_constructible. — end note]

```cpp
template<class InputIterator, class Size, class Function>
constexpr InputIterator for_each_n(InputIterator first, Size n, Function f);
```

16. Mandates: The type Size is convertible to an integral type (7.3.8, 11.4.7).
17. Preconditions: Function meets the Cpp17MoveConstructible requirements. [Note: Function need not meet the requirements of Cpp17CopyConstructible. — end note]
18. Preconditions: n >= 0 is true.
19. Effects: Applies f to the result of dereferencing every iterator in the range [first, first + n) in order. [Note: If the type of first meets the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator. — end note]
21. Remarks: If f returns a result, the result is ignored.
template<class ExecutionPolicy, class ForwardIterator, class Size, class Function>
ForwardIterator for_each_n(ExecutionPolicy&& exec, ForwardIterator first, Size n,
   Function f);

22  Mandates: The type Size is convertible to an integral type (7.3.8, 11.4.7).
23  Preconditions: Function meets the Cpp17CopyConstructible requirements.
24  Preconditions: n >= 0 is true.
25  Effects: Applies f to the result of dereferencing every iterator in the range [first, first + n).
[Note: If the type of first meets the requirements of a mutable iterator, f may apply non-constant functions
through the dereferenced iterator. — end note]
26  Returns: first + n.
27  Remarks: If f returns a result, the result is ignored. Implementations do not have the freedom granted
under 25.3.3 to make arbitrary copies of elements from the input sequence.

25.6.5 Find [alg.find]

template<input_iterator I, class Proj = identity,
   indirectly_unary_invocable<projected<I, Proj>> Fun>
constexpr ranges::for_each_n_result<I, Fun>
ranges::for_each_n(I first, iter_difference_t<I> n, Fun f, Proj proj = {});

28  Preconditions: n >= 0 is true.
29  Effects: Calls invoke(f, invoke(proj, *i)) for every iterator i in the range [first, first + n)
in order. [Note: If the result of invoke(proj, *i) is a mutable reference, f may apply non-constant
functions. — end note]
30  Returns: {first + n, std::move(f)}.
31  Remarks: If f returns a result, the result is ignored.
[Note: The overload in namespace ranges requires Fun to model copy_constructible. — end note]
template<input_range R, class Proj = identity, indirect_unary.predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::find_if(R&& r, Pred pred, Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class Proj = identity, indirect_unary.predicate<projected<I, Proj>> Pred>
constexpr I ranges::find_if_not(I first, S last, Pred pred, Proj proj = {});

template<input_range R, class Proj = identity, indirect_unary.predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::find_if_not(R&& r, Pred pred, Proj proj = {});

Let \( E \) be:

1. \( *i == \text{value} \) for \text{find};
2. \( \text{pred}(*i) \neq \text{false} \) for \text{find_if};
3. \( \text{pred}(*i) == \text{false} \) for \text{find_if_not};
4. \( \text{bool}(\text{invoke(proj, *i)} == \text{value}) \) for \text{ranges::find};
5. \( \text{bool}(\text{invoke(pred, invoke(proj, *i)))} \) for \text{ranges::find_if};
6. \( \text{bool}(\text{!invoke(pred, invoke(proj, *i)))} \) for \text{ranges::find_if_not}.

Returns: The first iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) is \text{true}. Returns \text{last} if no such iterator is found.

Complexity: At most \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.

§ 25.6.6 Find end [alg.find.end]

ForwardIterator1
find_end(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2,
        BinaryPredicate pred);

template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
        class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr subrange<I1>
ranges::find_end(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                 Proj1 proj1 = {}, Proj2 proj2 = {});

template<forward_range R1, forward_range R2,
        class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed subrange_t<R1>
ranges::find_end(R1&& r1, R2&& r2, Pred pred = {}),
Let:

1. \( \text{pred} \) be equal_to{} for the overloads with no parameter \( \text{pred} \);
2. \( E \) be:
   - \( \text{pred}(*i + n), *(\text{first2} + n) \) for the overloads in namespace std;
   - invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n))) for the overloads in namespace ranges;
3. \( i \) be last1 if \([\text{first2}, \text{last2})\) is empty, or if \((\text{last2} - \text{first2}) > (\text{last1} - \text{first1})\) is true, or if there is no iterator in the range \([\text{first1}, \text{last1} - (\text{last2} - \text{first2}))\) such that for every non-negative integer \( n < (\text{last2} - \text{first2}) \), \( E \) is true. Otherwise \( i \) is the last such iterator in \([\text{first1}, \text{last1} - (\text{last2} - \text{first2}))\).

Returns:

1. \( i \) for the overloads in namespace std.
2. \{i, i + (i == last1 ? 0 : last2 - first2)} for the overloads in namespace ranges.

Complexity: At most \((\text{last2} - \text{first2}) \times (\text{last1} - (\text{last2} - \text{first2}) + 1)\) applications of the corresponding predicate and any projections.

25.6.7 Find first

\[
\text{template\class InputIterator, class ForwardIterator} \\
\text{constexpr InputIterator} \\
\text{find_first_of(InputIterator first1, InputIterator last1,} \\
\text{ForwardIterator first2, ForwardIterator last2);} \\
\text{template\class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2} \\
\text{ForwardIterator1} \\
\text{find_first_of(ExecutionPolicy k,} \\

\text{Pred pred = {},} \\
\text{Proj1 proj1 = {}, Proj2 proj2 = {}}); \\
\]

Let \( E \) be:

- \( *i == *j \) for the overloads with no parameter \( \text{pred} \);
25.6.8 Adjacent find

template<class ForwardIterator>
constexpr ForwardIterator
adjacent_find(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
adjacent_find(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator
adjacent_find(ForwardIterator first, ForwardIterator last,
BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator
adjacent_find(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last,
BinaryPredicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_binary_predicate<projected<I, Proj>,
projected<I, Proj>> Pred = ranges::equal_to>
constexpr I ranges::adjacent_find(I first, S last, Pred pred = {}, Proj proj = {});

template<former_iterator R, class Proj = identity,
indirect_binary_predicate<projected<iterator_t<R>, Proj>,
projected<iterator_t<R>, Proj>> Pred = ranges::equal_to>
constexpr borrowed_iterator_t<R> ranges::adjacent_find(R&& r, Pred pred = {}, Proj proj = {});

Let $E$ be:

(1.1) $*i == *(i + 1)$ for the overloads with no parameter $\text{pred}$;
(1.2) $\text{pred}(*i, *j) \neq \text{false}$ for the overloads with a parameter $\text{pred}$ and no parameter $\text{proj}$;
(1.3) $\text{bool}($invoke($\text{pred}$, invoke($\text{proj}$, *i), invoke($\text{proj}$, *(i + 1)))) for the overloads with both parameters $\text{pred}$ and $\text{proj}$.

Returns: The first iterator $i$ such that both $i$ and $i + 1$ are in the range $[\text{first}, \text{last})$ for which $E$ holds. Returns last if no such iterator is found.

Complexity: For the overloads with no ExecutionPolicy, exactly

$$\min((i - \text{first}) + 1, (\text{last} - \text{first}) - 1)$$

applications of the corresponding predicate, where $i$ is adjacent_find's return value. For the overloads with an ExecutionPolicy, $O(\text{last} - \text{first})$ applications of the corresponding predicate, and no more than twice as many applications of any projection.

25.6.9 Count

template<class InputIterator, class T>
constexpr typename iterator_traits<InputIterator>::difference_type
count(InputIterator first, InputIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
typename iterator_traits<ForwardIterator>::difference_type
count(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
constexpr typename iterator_traits<InputIterator>::difference_type
count_if(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
typename iterator_traits<ForwardIterator>::difference_type
count_if(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>  
constexpr iter_difference_t<I>
ranges::count(I first, S last, const T& value, Proj proj = {});

template<input_range R, class T, class Proj = identity, 
    indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr range_difference_t<R>
ranges::count(R&& r, const T& value, Proj proj = {});

Let E be:

1. \(i == value\) for the overloads with no parameter pred or proj;
2. \(pred(i) != false\) for the overloads with a parameter pred but no parameter proj;
3. \(invoke(proj, i) == value\) for the overloads with a parameter proj but no parameter pred;
4. \(bool(invoke(pred, invoke(proj, i)))\) for the overloads with both parameters proj and pred.

Effects: Returns the number of iterators \(i\) in the range \([first, last)\) for which \(E\) holds.

Complexity: Exactly \(last - first\) applications of the corresponding predicate and any projection.
template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2, BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr ranges::mismatch_result<I1, I2>
ranges::mismatch(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr ranges::mismatch_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
ranges::mismatch(R1&& r1, R2&& r2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

Let last2 be first2 + (last1 - first1) for the overloads with no parameter last2 or r2.

Let E be:

1. !(*(first1 + n) == *(first2 + n)) for the overloads with no parameter pred;
2. pred(*(first1 + n), *(first2 + n)) == false for the overloads with a parameter pred and no parameter proj1;
3. !invoke(pred, invoke(proj1, *(first1 + n)), invoke(proj2, *(first2 + n))) for the overloads with both parameters pred and proj1.

Let N be min(last1 - first1, last2 - first2).

Returns: { first1 + n, first2 + n }, where n is the smallest integer in [0, N) such that E holds, or N if no such integer exists.

Complexity: At most N applications of the corresponding predicate and any projections.

§ 25.6.11 Equal [alg.equal]
Let:

(1.1) \( \text{last2 be first2 + (last1 - first1)} \) for the overloads with no parameter last2 or r2;

(1.2) \( \text{pred be equal_to{}} \) for the overloads with no parameter pred;

(1.3) \( \text{E be:} \)

(1.3.1) \( \text{pred(*i, *(first2 + (i - first1))) for the overloads with no parameter proj1;} \)

(1.3.2) \( \text{invoke(pred, invoke(proj1, *i), invoke(proj2, *(first2 + (i - first1)))) for} \)

the overloads with parameter proj1.

2 \( \text{Returns: If last1 \text{ - first1} != last2 \text{ - first2, return false. Otherwise return true if E holds} \)}

for every iterator i in the range [first1, last1] Otherwise, returns false.

3 \( \text{Complexity: If the types of first1, last1, first2, and last2:} \)

(3.1) \( \text{meet the Cpp17RandomAccessIterator requirements (23.3.5.6) for the overloads in} \)

namespace std;

(3.2) \( \text{pairwise model sized_sentinel_for (23.3.4.8) for the overloads in} \)

namespace ranges, and last1 \text{ - first1} != last2 \text{ - first2, then no applications of the corresponding predicate and each} \)

projection; otherwise,

(3.3) \( \text{For the overloads with no ExecutionPolicy, at most min(last1 \text{ - first1, last2 \text{ - first2})} \)

applications of the corresponding predicate and any projections.
For the overloads with an `ExecutionPolicy`, $O(\min(last1 - first1, last2 - first2))$ applications of the corresponding predicate.

### 25.6.12 Is permutation

**[alg.is.permutation]**

```cpp
template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2);
template<class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, BinaryPredicate pred);
template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2);
template<class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2, BinaryPredicate pred);
```

**Mandates:** `ForwardIterator1` and `ForwardIterator2` have the same value type.

**Preconditions:** The comparison function is an equivalence relation.

**Remarks:** If `last2` was not given in the argument list, it denotes `first2 + (last1 - first1)` below.

**Returns:** If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range `[first2, first2 + (last1 - first1)]`, beginning with `ForwardIterator2` begin, such that `equal(first1, last1, begin)` returns `true` or `equal(first1, last1, begin, pred)` returns `true`; otherwise, returns `false`.

**Complexity:** No applications of the corresponding predicate if `ForwardIterator1` and `ForwardIterator2` meet the requirements of random access iterators and `last1 - first1 != last2 - first2`. Otherwise, exactly `last1 - first1` applications of the corresponding predicate if `equal(first1, last1, first2, last2)` would return `true` if `pred` was not given in the argument list or `equal(first1, last1, first2, last2, pred)` would return `true` if `pred` was given in the argument list; otherwise, at worst $O(N^2)$, where $N$ has the value `last1 - first1`.

```cpp
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2, class Proj1 = identity, class Proj2 = identity, indirect_equivalence_relation<projected<I1, Proj1>, projected<I2, Proj2>> Pred = ranges::equal_to>
constexpr bool ranges::is_permutation(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

**Returns:** If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range `[first2, last2)`, bounded by `[pfirst, plast)`, such that `ranges::equal(first1, last1, pfirst, plast, pred, proj1, proj2)` returns `true`; otherwise, returns `false`.

**Complexity:** No applications of the corresponding predicate and projections if:

1. `S1` and `I1` model `sized_sentinel_for<S1, I1>`,
2. `S2` and `I2` model `sized_sentinel_for<S2, I2>`, and
3. `last1 - first1 != last2 - first2`.

Otherwise, exactly `last1 - first1` applications of the corresponding predicate and projections if `ranges::equal(first1, last1, first2, last2, pred, proj1, proj2)` would return `true`; otherwise, at worst $O(N^2)$, where $N$ has the value `last1 - first1`.
§ 25.6.13 Search

```cpp
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1
search(ForwardIterator1 first1, ForwardIterator1 last1,
     ForwardIterator2 first2, ForwardIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
search(ExecutionPolicy&& exec,
     ForwardIterator1 first1, ForwardIterator1 last1,
     ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
constexpr ForwardIterator1
search(ForwardIterator1 first1, ForwardIterator1 last1,
     ForwardIterator2 first2, ForwardIterator2 last2,
     BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator1
search(ExecutionPolicy&& exec,
     ForwardIterator1 first1, ForwardIterator1 last1,
     ForwardIterator2 first2, ForwardIterator2 last2,
     BinaryPredicate pred);
```

1. **Returns:** The first iterator \(i\) in the range \([first1, \text{last1} - (last2-first2))\) such that for every non-negative integer \(n\) less than \(last2 - first2\) the following corresponding conditions hold: \(*(i + n) == *(first2 + n), \text{pred}(i + n), *(first2 + n) \neq \text{false}\). Returns first1 if \([first2, last2)\) is empty, otherwise returns last1 if no such iterator is found.

2. **Complexity:** At most \((last1 - first1) \times (last2 - first2)\) applications of the corresponding predicate.

```cpp
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
         sentinel_for<I2> S2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr subrange<I1>
ranges::search(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                Proj1 proj1 = {}, Proj2 proj2 = {});

template<forward_range R1, forward_range R2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_subrange_t<R1>
ranges::search(R1&& r1, R2&& r2, Pred pred = {},
                Proj1 proj1 = {}, Proj2 proj2 = {});
```

3. **Returns:**

   - \(\{i, i + (last2 - first2)\}\), where \(i\) is the first iterator in the range \([first1, \text{last1} - (last2 - first2))\) such that for every non-negative integer \(n\) less than \(last2 - first2\) the condition
     
     \[
     \text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, *(i + n)), \text{invoke}(\text{proj2}, *(first2 + n))))
     \]
     
     is true.

4. **Complexity:** At most \((last1 - first1) \times (last2 - first2)\) applications of the corresponding predicate and projections.
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator
search_n(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last,
         Size count, const T& value);

template<class ForwardIterator, class Size, class T,  
        class BinaryPredicate>
constexpr ForwardIterator
search_n(ForwardIterator first, ForwardIterator last,
         Size count, const T& value,
         BinaryPredicate pred);

Mandates: The type Size is convertible to an integral type (7.3.8, 11.4.7).

Returns: The first iterator \(i\) in the range \([first, last - count)\) such that for every non-negative integer \(n\) less than count the following corresponding conditions hold: \(*(i + n) == value, \text{pred}(i + n, value) != false\). Returns last if no such iterator is found.

Complexity: At most last - first applications of the corresponding predicate.

template<forward_iterator I, sentinel_for<I> S, class T,  
         class Pred = ranges::equal_to, class Proj = identity>
requires indirectly_comparable<I, const T*, Pred, Proj>
constexpr subrange<I>
ranges::search_n(I first, S last, iter_difference_t<I> count,
                 const T& value, Pred pred = {}, Proj proj = {});

does: \{i, i + count\} where \(i\) is the first iterator in the range \([first, last - count)\) such that for every non-negative integer \(n\) less than count, the following condition holds: \(\text{invoke} \text{pred, invoke} \text{proj, *(i + n), value}\). Returns \{last, last\} if no such iterator is found.

Complexity: At most last - first applications of the corresponding predicate and projection.

template<class ForwardIterator, class Searcher>
constexpr ForwardIterator
search(ForwardIterator first, ForwardIterator last, const Searcher& searcher);

Effects: Equivalent to: return searcher(first, last).first;

Remarks: Searcher need not meet the Cpp17CopyConstructible requirements.

25.7 Mutating sequence operations [alg.modifying.operations]

25.7.1 Copy [alg.copy]

template<class InputIterator, class OutputIterator>
constexpr OutputIterator copy(InputIterator first, InputIterator last,  
OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::copy_result<I, O> ranges::copy(I first, S last, O result);
template<input_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::copy_result<borrowed_iterator_t<R>, O> ranges::copy(R&& r, O result);

Let \( N \) be \( \text{last} - \text{first} \).

**Preconditions:** result is not in the range \([\text{first}, \text{last})\).

**Effects:** Copies elements in the range \([\text{first}, \text{last})\) into the range \([\text{result}, \text{result} + N)\) starting from \text{first} and proceeding to \text{last}. For each non-negative integer \( n < N \), performs \(*{\text{result} + n}) = *{\text{first} + n}\).

**Returns:**
- \( \text{result} + N \) for the overload in namespace std.
- \( \{\text{last}, \text{result} + N\} \) for the overloads in namespace ranges.

**Complexity:** Exactly \( N \) assignments.

### § 25.7.1

© ISO/IEC 2020 – All rights reserved

1079
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O>
constexpr ranges::copy_if_result<I, O>
  ranges::copy_if(I first, S last, O result, Pred pred, Proj proj = {});

template<input_range R, weakly_incrementable O, class Proj = identity, indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::copy_if_result<borrowed_iterator_t<R>, O>
  ranges::copy_if(R&& r, O result, Pred pred, Proj proj = {});

Let $E$ be:
- (15.1) $\text{bool}(\text{pred}(i))$ for the overloads in namespace `std`;
- (15.2) $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, i)))$ for the overloads in namespace `ranges`,
and $N$ be the number of iterators $i$ in the range `[first, last)` for which the condition $E$ holds.

Preconditions: The ranges `[first, last)` and `[result, result + (last - first))` do not overlap. [Note: For the overload with an ExecutionPolicy, there may be a performance cost if `iterator_traits<ForwardIterator>::value_type` is not `Cpp17MoveConstructible` (Table 28). — end note]

Effects: Copies all of the elements referred to by the iterator $i$ in the range `[first, last)` for which $E$ is true.

Returns:
- (18.1) `result + N` for the overloads in namespace `std`.
- (18.2) `{last, result + N}` for the overloads in namespace `ranges`.

Complexity: Exactly `last - first` applications of the corresponding predicate and any projection.

Remarks: Stable (16.5.5.8).

template<class BidirectionalIterator1, class BidirectionalIterator2>
  constexpr BidirectionalIterator2
    copy_backward(BidirectionalIterator1 first, BidirectionalIterator1 last, BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
  requires indirectly_copyable<I1, I2>
  constexpr ranges::copy_backward_result<I1, I2>
    ranges::copy_backward(I1 first, S1 last, I2 result);

template<bidirectional_range R1, bidirectional_iterator I1>
  requires indirectly_copyable<iterator_t<R1>, I1>
  constexpr ranges::copy_backward_result<borrowed_iterator_t<R1>, I1>
    ranges::copy_backward(R1&& r, I1 result);

Let $N$ be `last - first`.

Preconditions: `result` is not in the range `(first, last)`.

Effects: Copies elements in the range `[first, last)` into the range `[result - N, result)` starting from `last - 1` and proceeding to `first`.231 For each positive integer $n \leq N$, performs $(\text{result} - n) = \ast(\text{last} - n)$.

Returns:
- (24.1) `result - N` for the overload in namespace `std`.
- (24.2) `{last, result - N}` for the overloads in namespace `ranges`.

Complexity: Exactly $N$ assignments.

25.7.2 Move [alg.move]

template<class InputIterator, class OutputIterator>
  constexpr OutputIterator move(InputIterator first, InputIterator last, OutputIterator result);

231) `copy_backward` should be used instead of `copy` when `last` is in the range `[result - N, result).`
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_movable<I, O>
constexpr ranges::move_result<I, O>
ranges::move(I first, S last, O result);

Let E be

- std::move(*(first + n)) for the overload in namespace std;
- ranges::iter_move(first + n) for the overloads in namespace ranges.

Let N be last - first.
1
Preconditions: result is not in the range [first, last).
2
Effects: Moves elements in the range [first, last) into the range [result, result + N) starting from first and proceeding to last. For each non-negative integer n < N, performs *(result + n) = E.
3
Returns:
(4.1) result + N for the overload in namespace std.
(4.2) {last, result + N} for the overloads in namespace ranges.
4
Complexity: Exactly N assignments.
5

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2 move(ExecutionPolicy&& policy,
    ForwardIterator1 first, ForwardIterator1 last,
    ForwardIterator2 result);
6
Let N be last - first.
7
Preconditions: The ranges [first, last) and [result, result + N) do not overlap.
8
Effects: Moves elements in the range [first, last) into the range [result, result + N). For each non-negative integer n < N, performs *(result + n) = std::move(*(first + n)).
9
Returns: result + N.
10
Complexity: Exactly N assignments.
11

template<class BidirectionalIterator1, class BidirectionalIterator2>
constexpr BidirectionalIterator2
move_backward(BidirectionalIterator1 first, BidirectionalIterator1 last,
    BidirectionalIterator2 result);
12

Let E be

- std::move(*(last - n)) for the overload in namespace std;
- ranges::iter_move(last - n) for the overloads in namespace ranges.

Let N be last - first.
13
Preconditions: result is not in the range [first, last].
14
Effects: Moves elements in the range [first, last) into the range [result - N, result) starting from last - 1 and proceeding to first.\footnote{move_backward should be used instead of move when last is in the range [result - N, result).}
15
Returns: result - 1
16
Complexity: Exactly N assignments.
17

§ 25.7.2 ©ISO/IEC 2020 – All rights reserved
ISO/IEC JTC1 SC22 WG21 N4860

\[ n = E. \]

**Returns:**
- \( \text{result} - N \) for the overload in namespace `std`.
- \{\text{last}, \text{result} - N\} for the overloads in namespace `ranges`.

**Complexity:** Exactly \( N \) assignments.

### 25.7.3 Swap

```cpp
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator2
swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
            ForwardIterator2 first2);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
swap_ranges(ExecutionPolicy&& exec,
            ForwardIterator1 first1, ForwardIterator1 last1,
            ForwardIterator2 first2);
```

```cpp
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2>
requires indirectly_swappable<I1, I2>
constexpr ranges::swap_ranges_result<I1, I2>
ranges::swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
```

```cpp
template<input_range R1, input_range R2>
requires indirectly_swappable<iterator_t<R1>, iterator_t<R2>>
constexpr ranges::swap_ranges_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
ranges::swap_ranges(R1&& r1, R2&& r2);
```

Let:
1. \( \text{last2} = \text{first2} + (\text{last1} - \text{first1}) \) for the overloads with no parameter named `last2`;
2. \( M = \min(\text{last1} - \text{first1}, \text{last2} - \text{first2}) \).

**Preconditions:** The two ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) do not overlap. For the overloads in namespace `std`, \(*(\text{first1} + n)\) is swappable with \((16.5.3.2) * (\text{first2} + n)\).

**Effects:** For each non-negative integer \( n < M \) performs:
1. \( \text{swap}(*(\text{first1} + n), *(\text{first2} + n)) \) for the overloads in namespace `std`;
2. \( \text{ranges::iter_swap(first1 + n, first2 + n)} \) for the overloads in namespace `ranges`.

**Returns:**
1. \( \text{last2} \) for the overloads in namespace `std`.
2. \{\text{first1} + \(M\), \text{first2} + \(M\}\} for the overloads in namespace `ranges`.

**Complexity:** Exactly \( M \) swaps.

```cpp
template<class ForwardIterator1, class ForwardIterator2>
constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);
```

**Preconditions:** \( a \) and \( b \) are dereferenceable. \( *a \) is swappable with \((16.5.3.2) * b\).

**Effects:** As if by \( \text{swap}(*a, *b) \).

### 25.7.4 Transform

```cpp
template<class InputIterator, class OutputIterator,
class UnaryOperation>
constexpr OutputIterator
transform(InputIterator first1, InputIterator last1,
          OutputIterator result, UnaryOperation op);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class UnaryOperation>
ForwardIterator2
transform(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
```
ForwardIterator2 result, UnaryOperation op);

template<class InputIterator1, class InputIterator2,
          class OutputIterator, class BinaryOperation>
   constexpr OutputIterator
   transform(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2, OutputIterator result,
             BinaryOperation binary_op);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
          class ForwardIterator, class BinaryOperation>
   ForwardIterator
   transform(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator result,
             BinaryOperation binary_op);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
          copy_constructible F, class Proj = identity>
   requires indirectly_writable<O, indirect_result_t<F&, projected<I, Proj>>
   ranges::unary_transform_result<I, O>
   ranges::transform(I first1, S last1, O result, F op, Proj proj = {});

template<input_range R, weakly_incrementable O, copy_constructible F,
          class Proj = identity>
   requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R>, Proj>>
   ranges::unary_transform_result<borrowed_iterator_t<R>, O>
   ranges::transform(R&& r, O result, F op, Proj proj = {});

template<input_iterator I1, sentinel_for<I> S1, input_iterator I2, sentinel_for<I> S2,
          weakly_incrementable O, copy_constructible F, class Proj1 = identity,
          class Proj2 = identity>
   requires indirectly_writable<O, indirect_result_t<F&, projected<I1, Proj1>,
          projected<I2, Proj2>>
   ranges::binary_transform_result<I1, I2, O>
   ranges::transform(I1 first1, S1 last1, I2 first2, S2 last2, O result,
          F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
          copy_constructible F, class Proj1 = identity, class Proj2 = identity>
   requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R1>, Proj1>,
          projected<iterator_t<R2>, Proj2>>
   ranges::binary_transform_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
   ranges::transform(R1&& r1, R2&& r2, O result,
          F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});

1 Let:

   (1.1) last2 be first2 + (last1 - first1) for the overloads with parameter first2 but no parameter last2;

   (1.2) N be last1 - first1 for unary transforms, or \(\min(last1 - first1, last2 - first2)\) for binary transforms;

   (1.3) E be

      (1.3.1) op(*(first1 + (i - result))) for unary transforms defined in namespace std;

      (1.3.2) binary_op(*(first1 + (i - result))), *(first2 + (i - result))) for binary transforms defined in namespace std;

      (1.3.3) invoke(op, invoke(proj, *(first1 + (i - result)))) for unary transforms defined in namespace ranges;

      (1.3.4) invoke(binary_op, invoke(proj1, *(first1 + (i - result))), invoke(proj2, *(first2 + (i - result)))) for binary transforms defined in namespace ranges.

2 Preconditions: op and binary_op do not invalidate iterators or subranges, nor modify elements in the ranges

   (2.1) [first1, first1 + N],

   (2.2) [first2, first2 + N], and
(2.3) — \[ \text{result, result + } N \].

\[ \text{Effects: Assigns through every iterator } i \text{ in the range } \text{result, result + } N \text{ a new corresponding value equal to } E. \]

Returns:

(4.1) — result + } N \text{ for the overloads defined in namespace std.}

(4.2) — \{ \text{first1 + } N, \text{result + } N \} \text{ for unary transforms defined in namespace ranges.}

(4.3) — \{ \text{first1 + } N, \text{first2 + } N, \text{result + } N \} \text{ for binary transforms defined in namespace ranges.}

Complexity: Exactly } N \text{ applications of } op \text{ or } \text{binary_op}, \text{and any projections. This requirement also applies to the overload with an ExecutionPolicy.}

Remarks: result may be equal to first1 or first2.

25.7.5 Replace

\[ \text{template<class ForwardIterator, class T> } \]
\[ \text{constexpr void replace(ForwardIterator first, ForwardIterator last, } \]
\[ \text{const T& old_value, const T& new_value); } \]
\[ \text{template<class ExecutionPolicy, class ForwardIterator, class T> } \]
\[ \text{void replace(ExecutionPolicy&& exec, } \]
\[ \text{ForwardIterator first, ForwardIterator last, } \]
\[ \text{const T& old_value, const T& new_value); } \]
\[ \text{template<class ForwardIterator, class Predicate, class T> } \]
\[ \text{constexpr void replace_if(ForwardIterator first, ForwardIterator last, } \]
\[ \text{Predicate pred, const T& new_value); } \]
\[ \text{template<class ExecutionPolicy, class ForwardIterator, class Predicate, class T> } \]
\[ \text{void replace_if(ExecutionPolicy&& exec, } \]
\[ \text{ForwardIterator first, ForwardIterator last, } \]
\[ \text{Predicate pred, const T& new_value); } \]
\[ \text{template<input_iterator I, sentinel_for<I> S, class T1, class T2, class Proj = identity> } \]
\[ \text{requires indirectly_writable<I, const T2> } \&\& \]
\[ \text{indirect_binary_predicate<ranges::equal_to, projected<I, Proj>>, const T1>> } \]
\[ \text{constexpr I } \]
\[ \text{ranges::replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = {}); } \]
\[ \text{template<input_range R, class T1, class T2, class Proj = identity> } \]
\[ \text{requires indirectly_writable<iterator_t<R>, const T2> } \&\& \]
\[ \text{indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>>, const T1>> } \]
\[ \text{constexpr borrowed_iterator_t<R> } \]
\[ \text{ranges::replace(R&& r, const T1& old_value, const T2& new_value, Proj proj = {}); } \]
\[ \text{template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity, } \]
\[ \text{indirect_unary_predicate<projected<I, Proj>> Pred> } \]
\[ \text{requires indirectly_writable<I, const T& Proj> } \]
\[ \text{constexpr I ranges::replace_if(I first, S last, Pred pred, const T& new_value, Proj proj = {}); } \]
\[ \text{template<input_range R, class T, class Proj = identity, } \]
\[ \text{indirect_unary_predicate<projected<iterator_t<R>, Proj>>, Pred> } \]
\[ \text{requires indirectly_writable<iterator_t<R>, const T& Proj> } \]
\[ \text{constexpr borrowed_iterator_t<R> } \]
\[ \text{ranges::replace_if(R&& r, Pred pred, const T& new_value, Proj proj = {}); } \]

Let } E \text{ be}

\[ \text{(1.1) — bool(*i == old_value) for replace; } \]
\[ \text{(1.2) — bool(pred(*i)) for replace_if; } \]
\[ \text{(1.3) — bool:invoke(proj, +i) == old_value) for ranges::replace; } \]
\[ \text{(1.4) — bool:invoke(pred, invoke(proj, +i))) for ranges::replace_if. } \]

\[ \text{233) The use of fully closed ranges is intentional.} \]

\[ \text{§ 25.7.5} \]
2 Mandates: new_value is writable (23.3.1) to first.

3 Effects: Substitutes elements referred by the iterator i in the range [first, last) with new_value, when E is true.

4 Returns: last for the overloads in namespace ranges.

5 Complexity: Exactly last - first applications of the corresponding predicate and any projection.

\[
\begin{align*}
\text{template}<\text{class InputIterator, class OutputIterator, class T}> & \\
\text{constexpr OutputIterator} & \\
\text{replace_copy(InputIterator first, InputIterator last, OutputIterator result, const T& old_value, const T& new_value);} \\
\text{template}<\text{class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T}> & \\
\text{ForwardIterator2} & \\
\text{replace_copy(ExecutionPolicy&& exec, ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result, const T& old_value, const T& new_value);} \\
\text{template}<\text{class InputIterator, class OutputIterator, class Predicate, class T}> & \\

\end{align*}
\]

6 Let \( E \) be

\[
\begin{align*}
(6.1) & \quad \text{bool}(*\text{first} + (i - \text{result})) == \text{old_value} \quad \text{for replace_copy}; \\
(6.2) & \quad \text{bool(pred(*\text{first} + (i - \text{result})))) \quad \text{for replace_copy_if};
\end{align*}
\]
25.7.6 Fill

\[ \text{template<class ForwardIterator, class T>} \]
\text{constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);} 
\text{template<class ExecutionPolicy, class ForwardIterator, class T>}
\text{ execute(ExecutionPolicy&& exec,}
\text{ ForwardIterator first, ForwardIterator last, const T& value);} 
\text{template<class OutputIterator, class Size, class T>}
\text{constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);} 
\text{template<class ExecutionPolicy, class ForwardIterator, class Size, class T>}
\text{ForwardIterator fill_n(ExecutionPolicy&& exec,}
\text{ ForwardIterator first, Size n, const T& value);} 
\text{template<class T, output_iterator<const T&> O, sentinel_for<O> S>}
\text{constexpr O ranges::fill(O first, S last, const T& value);} 
\text{template<class T, output_range<const T&> R>}
\text{constexpr borrowed_iterator_t<R> ranges::fill(R&& r, const T& value);} 
\text{template<class T, output_iterator<const T&> O>}
\text{constexpr O ranges::fill_n(O first, iter_difference_t<O> n, const T& value);} 

Let \( N \) be \( \max(0, n) \) for the \text{fill_n} algorithms, and \( \text{last} - \text{first} \) for the \text{fill} algorithms.

\begin{itemize}
  \item \text{Mandates:} The expression \( \text{value} \) is writable (23.3.1) to the output iterator. The type \( \text{Size} \) is convertible to an integral type (7.3.8, 11.4.7).
  \item \text{Effects:} Assigns \( \text{value} \) through all the iterators in the range \([\text{first}, \text{first} + N]\).
  \item \text{Returns:} \( \text{first} + N \).
  \item \text{Complexity:} Exactly \( N \) assignments.
\end{itemize}

25.7.7 Generate

\[ \text{template<class ForwardIterator, class Generator>} \]
\text{constexpr void generate(ForwardIterator first, ForwardIterator last, Generator gen);} 
\text{template<class ExecutionPolicy, class ForwardIterator, class Generator>}
\text{execute(ExecutionPolicy&& exec,}
\text{ ForwardIterator first, ForwardIterator last, Generator gen);} 
\text{template<class OutputIterator, class Size, class Generator>}
\text{constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);} 
\text{template<class ExecutionPolicy, class ForwardIterator, class Size, class Generator>}
\text{ForwardIterator generate_n(ExecutionPolicy&& exec,}
\text{ ForwardIterator first, Size n, Generator gen);} 

\[ \text{\section{25.7.7}} \]
\[ \text{\section{25.7.7 Generate}} \]
\[ \text{\footnotesize \copyright ISO/IEC 2020 – All rights reserved} \]
template<input_or_output_iterator O, sentinel_for<O> S, copy_constructible F>
requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
constexpr O ranges::generate(O first, S last, F gen);

template<class R, copy_constructible F>
requires invocable<F&> && output_range<R, invoke_result_t<F&>>
constexpr borrowed_iterator_t<R> ranges::generate(R&& r, F gen);

template<input_or_output_iterator O, copy_constructible F>
requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
constexpr O ranges::generate_n(O first, iter_difference_t<O> n, F gen);

Let \( N \) be \( \max(0, n) \) for the `generate_n` algorithms, and \( \text{last} - \text{first} \) for the `generate` algorithms.

**Mandates:** Size is convertible to an integral type (7.3.8, 11.4.7).

**Effects:** Assigns the result of successive evaluations of `gen()` through each iterator in the range \([\text{first}, \text{first} + N]\).

**Returns:** \( \text{first} + N \).

**Complexity:** Exactly \( N \) evaluations of `gen()` and assignments.

### 25.7.8 Remove

```cpp
template<class ForwardIterator, class T>
constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,
const T& value);

template<class ExecutionPolicy, class ForwardIterator, class T>
ForwardIterator remove(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last,
const T& value);

template<class ForwardIterator, class Predicate>
constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,
Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator remove_if(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last,
Predicate pred);

template<permutable I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr subrange<I> ranges::remove(I first, S last, const T& value, Proj proj = {});

template<forward_range R, class T, class Proj = identity>
requires permutable<iterator_t<R>> &&
indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr borrowed_subrange_t<R> ranges::remove(R&& r, const T& value, Proj proj = {});

template<permutable I, sentinel_for<I> S, class T, class Proj = identity,
indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr subrange<I> ranges::remove_if(I first, S last, Pred pred, Proj proj = {});

template<forward_range R, class Proj = identity,
indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::remove_if(R&& r, Pred pred, Proj proj = {});
```

1. Let \( E \) be
   1. \( \text{bool(*i == value)} \) for `remove`;
   2. \( \text{bool(pred(*i))} \) for `remove_if`;
   3. \( \text{bool(invoke(proj, *i) == value)} \) for `ranges::remove`;
   4. \( \text{bool(invoke(pred, invoke(proj, *i)))} \) for `ranges::remove_if`.

**Preconditions:** For the algorithms in namespace `std`, the type of `*first` meets the `Cpp17MoveAssignable` requirements (Table 30).
Effects: Eliminates all the elements referred to by iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) holds.

Returns: Let \( j \) be the end of the resulting range. Returns:

- \( j \) for the overloads in namespace std.
- \([j, \text{last})\) for the overloads in namespace ranges.

Remarks: Stable (16.5.5.8).

Complexity: Exactly \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.

[Note: Each element in the range \([\text{ret}, \text{last})\), where \( \text{ret} \) is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — end note]

```cpp
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
remove_copy(InputIterator first, InputIterator last,
            OutputIterator result, const T& value);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class T>
ForwardIterator2
remove_copy(ExecutionPolicy&& exec,
            ForwardIterator1 first, ForwardIterator1 last,
            ForwardIterator2 result, const T& value);
```

```cpp
template<class InputIterator, class OutputIterator, class Predicate>
constexpr OutputIterator
remove_copy_if(InputIterator first, InputIterator last,
               OutputIterator result, Predicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class Predicate>
ForwardIterator2
remove_copy_if(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result, Predicate pred);
```

```cpp
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class T,
class Proj = identity>
requires indirectly_copyable<I, O> &&
indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*> constexpr ranges::remove_copy_result(I, O>
ranges::remove_copy(I first, S last, O result, const T& value, Proj proj = {});
```

```cpp
template<input_range R, weakly_incrementable O, class T, class Proj = identity>
requires indirectly_copyable<iterator_t<R>, O> &&
indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*> constexpr ranges::remove_copy_result(borrowed_iterator_t<R>, O>
ranges::remove_copy(R&& r, O result, const T& value, Proj proj = {});
```

```cpp
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
class T, class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O> constexpr ranges::remove_copy_if_result<I, O>
ranges::remove_copy_if(I first, S last, O result, Pred pred, Proj proj = {});
```

```cpp
template<input_range R, weakly_incrementable O, class Proj = identity,
class Proj = identity, indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O> constexpr ranges::remove_copy_if_result<borrowed_iterator_t<R>, O>
ranges::remove_copy_if(R&& r, O result, Pred pred, Proj proj = {});
```

Let \( E \) be

- \( \text{bool}(*i == \text{value}) \) for remove_copy;
- \( \text{bool}(\text{pred}(*i)) \) for remove_copy_if;
- \( \text{bool}(\text{invoke}(\text{proj}, *i) == \text{value}) \) for ranges::remove_copy;
Let \( N \) be the number of elements in \([\text{first}, \text{last})\) for which \( E \) is false.

Mandates: \(*\text{first}\) is writable (23.3.1) to result.

Preconditions: The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + (\text{last} - \text{first}))\) do not overlap.  

[Note: For the overloads with an \emph{ExecutionPolicy}, there may be a performance cost if \emph{iterator_traits<\text{ForwardIterator}>}:\emph{value_type} does not meet the \emph{Cpp17MoveConstructible} (Table 28) requirements. — end note]

Effects: Copies all the elements referred to by the iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) is false.

Returns:

— \( \text{result} + N \), for the algorithms in \emph{namespace std}.

— \( \{\text{last}, \text{result} + N\} \), for the algorithms in \emph{namespace ranges}.

Complexity: Exactly \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.

Remarks: Stable (16.5.5.8).

25.7.9 Unique [\emph{alg.unique}]

\[
\begin{align*}
\text{template<class ForwardIterator>} & \quad \text{constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);} \\
\text{template<class ExecutionPolicy, class ForwardIterator>} & \quad \text{ForwardIterator unique(ExecutionPolicy\&\& exec,}
\quad \text{ForwardIterator first, ForwardIterator last);} \\
\text{template<class ForwardIterator, class BinaryPredicate>} & \quad \text{constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last,}
\quad \text{BinaryPredicate pred);} \\
\text{template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>} & \quad \text{ForwardIterator unique(ExecutionPolicy\&\& exec,}
\quad \text{ForwardIterator first, ForwardIterator last,}
\quad \text{BinaryPredicate pred);} \\
\text{template<permutable I, sentinel_for<I> S, class Proj = identity,}
\quad \text{indirect_equivalence_relation<projected<\text{i}, \text{Proj}>> C = ranges::equal_to>} \\
\text{constexpr subrange<I> ranges::unique(I first, S last, C comp = {}, Proj proj = {});} \\
\text{template<forward_range R, class Proj = identity,}
\quad \text{indirect_equivalence_relation<projected<\text{iterator_t</R>, Proj>> C = ranges::equal_to>} \\
\text{constexpr borrowed_subrange_t<R> ranges::unique(R&& r, C comp = {}, Proj proj = {});} \\
\end{align*}
\]

Let \( \text{pred} \) be \emph{equal_to}{} for the overloads with no parameter \( \text{pred} \), and let \( E \) be

\[
\begin{align*}
(1.1) & \quad \text{bool(\emph{pred}(\ast(i - 1), \ast i)) for the overloads in \emph{namespace std};} \\
(1.2) & \quad \text{bool(\emph{invoke}(\emph{comp}, \emph{invoke}(\emph{proj}, \ast(i - 1)), \emph{invoke}(\emph{proj}, \ast i))) for the overloads in}\n\quad \text{\emph{namespace ranges}.}
\end{align*}
\]

Preconditions: For the overloads in \emph{namespace std}, \( \text{pred} \) is an equivalence relation and the type of \(*\text{first}\) meets the \emph{Cpp17MoveAssignble} requirements (Table 30).

Effects: For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator \( i \) in the range \([\text{first} + 1, \text{last})\) for which \( E \) is \emph{true}.

Returns: Let \( j \) be the end of the resulting range. Returns:

\[
\begin{align*}
(4.1) & \quad \text{\{j, last\} for the overloads in \emph{namespace std}.} \\
(4.2) & \quad \text{\{j, last\} for the overloads in \emph{namespace ranges}.}
\end{align*}
\]

Complexity: For nonempty ranges, exactly \( (\text{last} - \text{first}) - 1 \) applications of the corresponding predicate and no more than twice as many applications of any projection.
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last, 
OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
unique_copy(ExecutionPolicy&& exec,

ForwardIterator2 result);

template<class InputIterator, class OutputIterator, 
class BinaryPredicate>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last, 
OutputIterator result, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, 
class BinaryPredicate>
ForwardIterator2
unique_copy(ExecutionPolicy&& exec, 
ForwardIterator1 first, ForwardIterator1 last, 
ForwardIterator2 result, BinaryPredicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity, 
indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
requires indirectly_copyable<I, O> && 
(forward_iterator<I> || 
(indirectly_copyable_storable<I, O>))
constexpr ranges::unique_copy_result<I, O>
ranges::unique_copy(I first, S last, O result, C comp = {}, Proj proj = {});

template<input_range R, weakly_incrementable O, class Proj = identity, 
indirect_equivalence_relation<iterator_t<R>, Proj>> C = ranges::equal_to>
requires indirectly_copyable<iterator_t<R>, O> && 
(forward_iterator<iterator_t<R>> || 
(indirectly_copyable_storable<iterator_t<R>, O>))
constexpr ranges::unique_copy_result<borrowed_iterator_t<R>, O>
ranges::unique_copy(R&& r, O result, C comp = {}, Proj proj = {});

Let \( \text{pred} \) be \text{equal_to}{} for the overloads in namespace \text{std} with no parameter \( \text{pred} \), and let \( E \) be

- \( \text{bool} (\text{pred}(*i, *(i - 1))) \) for the overloads in namespace \text{std};
- \( \text{bool} (\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, *i), \text{invoke}(\text{proj}, *(i - 1))))) \) for the overloads in namespace \text{ranges}.

**Mandates:** \( \ast \text{first} \) is writable (23.3.1) to \( \text{result} \).

**Preconditions:**

- The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result}+(\text{last}-\text{first}))\) do not overlap.
- For the overloads in namespace \text{std}:
  - The comparison function is an equivalence relation.
  - For the overloads with no \text{ExecutionPolicy}, let \( T \) be the value type of \text{InputIterator}.
    If \text{InputIterator} meets the \text{Cpp17ForwardIterator} requirements, then there are no additional requirements for \( T \). Otherwise, if \text{OutputIterator} meets the \text{Cpp17ForwardIterator} requirements and its value type is the same as \( T \), then \( T \) meets the \text{Cpp17CopyAssignable} (Table 31) requirements. Otherwise, \( T \) meets both the \text{Cpp17CopyConstructible} (Table 29) and \text{Cpp17CopyAssignable} requirements. [Note: For the overloads with an \text{ExecutionPolicy}, there may be a performance cost if the value type of \text{ForwardIterator1} does not meet both the \text{Cpp17CopyConstructible} and \text{Cpp17CopyAssignable} requirements. — end note]

**Effects:** Copies only the first element from every consecutive group of equal elements referred to by the iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) holds.

**Returns:**
25.7.10 Reverse

Template:

```cpp
#include <ranges>

template<class BidirectionalIterator>
constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);

template<class ExecutionPolicy, class BidirectionalIterator>
void reverse(ExecutionPolicy&& exec,
              BidirectionalIterator first, BidirectionalIterator last);
```

**Preconditions:** For the overloads in namespace std, `BidirectionalIterator` meets the Cpp17ValueSwappable requirements (16.5.3.2).

**Effects:** For each non-negative integer \( i < (last - first) / 2 \), applies `std::iter_swap` or `ranges::iter_swap` for the overloads in namespace ranges, to all pairs of iterators \( first + i, (last - i) - 1 \).

**Returns:** `last` for the overloads in namespace ranges.

**Complexity:** Exactly \((last - first)/2\) swaps.

Template:

```cpp
#include <ranges>

template<class BidirectionalIterator, class OutputIterator>
constexpr OutputIterator reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
                                       OutputIterator result);

template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>
ForwardIterator reverse_copy(ExecutionPolicy&& exec,
                             BidirectionalIterator first, BidirectionalIterator last,
                             ForwardIterator result);
```

**Preconditions:** The ranges \([first, last)\) and \([result, result + N)\) do not overlap.

**Effects:** Copies the range \([first, last)\) to the range \([result, result + N)\) such that for every non-negative integer \( i < N \) the following assignment takes place: `*(result + N - 1 - i) = *(first + i)`.

**Returns:**

- `result + N` for the overloads in namespace std.
- \{last, result + N\} for the overloads in namespace ranges.

**Complexity:** Exactly \(N\) assignments.
25.7.11 Rotate

template<class ForwardIterator>
constexpr ForwardIterator
rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
rotate(ExecutionPolicy&& exec,
   ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::rotate(I first, I middle, S last);

1 Preconditions: [first, middle) and [middle, last) are valid ranges. For the overloads in namespace std, ForwardIterator meets the Cpp17ValueSwappable requirements (16.5.3.2), and the type of *first meets the Cpp17MoveConstructible (Table 28) and Cpp17MoveAssignable (Table 30) requirements.

2 Effects: For each non-negative integer i < (last - first), places the element from the position first + i into position first + (i + (last - middle)) % (last - first). [Note: This is a left rotate. — end note]

Returns:
1 (3.1) — first + (last - middle) for the overloads in namespace std.
(3.2) — {first + (last - middle), last} for the overload in namespace ranges.

Complexity: At most last - first swaps.

template<formal_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::rotate(R&& r, iterator_t<R> middle);

5 Effects: Equivalent to: return ranges::rotate(ranges::begin(r), middle, ranges::end(r));

template<class ForwardIterator, class OutputIterator>
constexpr OutputIterator
rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
   OutputIterator result);

5 template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
rotate_copy(ExecutionPolicy&& exec,
   ForwardIterator1 first, ForwardIterator1 middle, ForwardIterator1 last,
   ForwardIterator2 result);

template<formal_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::rotate_copy_result<I, O>
ranges::rotate_copy(I first, I middle, S last, O result);

6 Let N be last - first.

7 Preconditions: [first, middle) and [middle, last) are valid ranges. The ranges [first, last) and [result, result + N) do not overlap.

8 Effects: Copies the range [first, last) to the range [result, result + N) such that for each non-negative integer i < N the following assignment takes place: *(result + i) = *(first + (i + (middle - first)) % N).

9 Returns:
(9.1) — result + N for the overloads in namespace std.
(9.2) — {last, result + N} for the overload in namespace ranges.

Complexity: Exactly N assignments.
ranges::rotate_copy(R&& r, iterator_t<R> middle, O result);

Effects: Equivalent to:

return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), result);

25.7.12 Sample

SampleIterator sample(PopulationIterator first, PopulationIterator last,
SampleIterator out, Distance n,
UniformRandomBitGenerator&& g);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Gen>
requires (forward_iterator<I> || random_access_iterator<O>) &&
indirectly_copyable<I, O> &&
uniform_random_bit_generator<remove_reference_t<Gen>>
O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);

template<input_range R, weakly_incrementable O, class Gen>
requires (forward_range<R> || random_access_iterator<O>) &&
indirectly_copyable<iterator_t<R>, O> &&
uniform_random_bit_generator<remove_reference_t<Gen>>
O ranges::sample(R&& r, O out, range_difference_t<R> n, Gen&& g);

Mandates: For the overload in namespace std, Distance is an integer type and *first is writable (23.3.1) to out.

Preconditions: out is not in the range [first, last). For the overload in namespace std:

(2.1) — PopulationIterator meets the Cpp17InputIterator requirements (23.3.5.2).
(2.2) — SampleIterator meets the Cpp17OutputIterator requirements (23.3.5.3).
(2.3) — SampleIterator meets the Cpp17RandomAccessIterator requirements (23.3.5.6) unless PopulationIterator meets the Cpp17ForwardIterator requirements (23.3.5.4).
(2.4) — remove_reference_t<UniformRandomBitGenerator> meets the requirements of a uniform random bit generator type (26.6.2.3).

Effects: Copies min(last - first, n) elements (the sample) from [first, last) (the population) to out such that each possible sample has equal probability of appearance. [Note: Algorithms that obtain such effects include selection sampling and reservoir sampling. — end note]

Returns: The end of the resulting sample range.

Complexity: \(O(last - first)\).

Remarks:

(6.1) — For the overload in namespace std, stable if and only if PopulationIterator meets the Cpp17ForwardIterator requirements. For the first overload in namespace ranges, stable if and only if I models forward_iterator.

(6.2) — To the extent that the implementation of this function makes use of random numbers, the object g serves as the implementation’s source of randomness.

25.7.13 Shuffle

void shuffle(RandomAccessIterator first,
RandomAccessIterator last,
UniformRandomBitGenerator&& g);

template<random_access_iterator I, sentinel_for<I> S, class Gen>
requires permutable<I> &&
uniform_random_bit_generator<remove_reference_t<Gen>>
I ranges::shuffle(I first, S last, Gen&& g);
template<random_access_range R, class Gen>
requires permuter<iterator_t<R>> &&
    uniform_random_bit_generator<remove_reference_t<Gen>>
borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);

Preconditions: For the overload in namespace std:
(1.1) — RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.5.3.2).
(1.2) — The type remove_reference_t<UniformRandomBitGenerator> meets the uniform random bit generator (26.6.2.3) requirements.

Effects: Permutes the elements in the range [first, last) such that each possible permutation of those elements has equal probability of appearance.

Returns: last for the overloads in namespace ranges.

Complexity: Exactly (last - first) - 1 swaps.

Remarks: To the extent that the implementation of this function makes use of random numbers, the object referenced by g shall serve as the implementation’s source of randomness.

25.7.14 Shift

template<class ForwardIterator>
constexpr ForwardIterator
shift_left(ForwardIterator first, ForwardIterator last,
typename iterator_traits<ForwardIterator>::difference_type n);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
typename iterator_traits<ForwardIterator>::difference_type n);

Preconditions: n >= 0 is true. The type of *first meets the Cpp17MoveAssignable requirements.

Effects: If n == 0 or n >= last - first, does nothing. Otherwise, moves the element from position first + n + i into position first + i for each non-negative integer i < (last - first) - n. In the first overload case, does so in order starting from i = 0 and proceeding to i = (last - first) - n - 1.

Returns: first + (last - first - n) if n < last - first, otherwise first.

Complexity: At most (last - first) - n assignments.

template<class ForwardIterator>
constexpr ForwardIterator
shift_right(ForwardIterator first, ForwardIterator last,
typename iterator_traits<ForwardIterator>::difference_type n);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
typename iterator_traits<ForwardIterator>::difference_type n);

Preconditions: n >= 0 is true. The type of *first meets the Cpp17MoveAssignable requirements. ForwardIterator meets the Cpp17BidirectionalIterator requirements (23.3.5.5) or the Cpp17ValueSwappable requirements.

Effects: If n == 0 or n >= last - first, does nothing. Otherwise, moves the element from position first + i into position first + n + i for each non-negative integer i < (last - first) - n. In the first overload case, if ForwardIterator meets the Cpp17BidirectionalIterator requirements, does so in order starting from i = (last - first) - n - 1 and proceeding to i = 0.

Returns: first + n if n < last - first, otherwise last.

Complexity: At most (last - first) - n assignments or swaps.

25.8 Sorting and related operations

The operations in 25.8 defined directly in namespace std have two versions: one that takes a function object of type Compare and one that uses an operator<.
Compare is a function object type (20.14) that meets the requirements for a template parameter named BinaryPredicate (25.2). The return value of the function call operation applied to an object of type Compare, when contextually converted to bool (7.3), yields true if the first argument of the call is less than the second, and false otherwise. Compare comp is used throughout for algorithms assuming an ordering relation.

For all algorithms that take Compare, there is a version that uses operator< instead. That is, comp(*i, *j) != false defaults to *i < *j != false. For algorithms other than those described in 25.8.3, comp shall induce a strict weak ordering on the values.

The term strict refers to the requirement of an irreflexive relation (!comp(x, x) for all x), and the term weak to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define equiv(a, b) as !comp(a, b) && !comp(b, a), then the requirements are that comp and equiv both be transitive relations:

\[(1)\quad \text{comp}(a, b) \land \text{comp}(b, c) \implies \text{comp}(a, c)\]
\[(2)\quad \text{equiv}(a, b) \land \text{equiv}(b, c) \implies \text{equiv}(a, c)\]

[Note: Under these conditions, it can be shown that

\[(3)\quad \text{equiv} \text{ is an equivalence relation},\]
\[(4)\quad \text{comp} \text{ induces a well-defined relation on the equivalence classes determined by equiv, and}\]
\[(5)\quad \text{the induced relation is a strict total ordering.}\]

A sequence is sorted with respect to a comp and proj for a comparator and projection comp and proj if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence,

\[\text{bool} (\text{invoke} (\text{comp}, \text{invoke} (\text{proj}, *(i + n)), \text{invoke} (\text{proj}, *i)))\]

is false.

A sequence [start, finish) is partitioned with respect to an expression f(e) if there exists an integer n such that for all 0 <= i < (finish - start), f(*(start + i)) is true if and only if i < n.

In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an operator==, but an equivalence relation induced by the strict weak ordering. That is, two elements a and b are considered equivalent if and only if !(a < b) && !(b < a).

25.8.1 Sorting

25.8.1.1 sort

\[\text{template<class RandomAccessIterator>}\]
\[\quad \text{constexpr void sort}(\text{RandomAccessIterator} \text{first, RandomAccessIterator} \text{last});\]
\[\text{template<class ExecutionPolicy, class RandomAccessIterator>}\]
\[\quad \text{void sort}(\text{ExecutionPolicy&& exec,}\]
\[\quad \text{RandomAccessIterator} \text{first, RandomAccessIterator} \text{last});\]

\[\text{template<class RandomAccessIterator, class Compare>}\]
\[\quad \text{constexpr void sort}(\text{RandomAccessIterator} \text{first, RandomAccessIterator} \text{last,}\]
\[\quad \text{Compare comp});\]
\[\text{template<class ExecutionPolicy, class RandomAccessIterator, class Compare>}\]
\[\quad \text{void sort}(\text{ExecutionPolicy&& exec,}\]
\[\quad \text{RandomAccessIterator} \text{first, RandomAccessIterator} \text{last,}\]
\[\quad \text{Compare comp});\]

\[\text{template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,}\]
\[\quad \text{class Proj = identity>}\]
\[\quad \text{requires sortable}<I, \text{Comp, Proj}>\]
\[\quad \text{constexpr I}\]
\[\quad \text{ranges::sort}(I \text{first, S last, Comp comp = {}, Proj proj = {}});\]
\[\text{template<random_access_range R, class Comp = ranges::less, class Proj = identity>}\]
\[\quad \text{requires sortable}<\text{iterator_t}<R>, \text{Comp, Proj}>\]
\[\quad \text{constexpr borrowed_iterator_t}<\text{R}>\]
ranges::sort(R&& r, Comp comp = {}, Proj proj = {});

Let \( \text{comp} \) be \text{less{}} and \( \text{proj} \) be \text{identity{}} for the overloads with no parameters by those names.

**Preconditions:** For the overloads in namespace \text{std}, \text{RandomAccessIterator} meets the \text{Cpp17ValueSwappable} requirements (16.5.3.2) and the type of \(*\text{first} \) meets the \text{Cpp17MoveConstructible} (Table 28) and \text{Cpp17MoveAssignable} (Table 30) requirements.

**Effects:** Sorts the elements in the range \([\text{first}, \text{last})\) with respect to \text{comp} and \text{proj}.

**Returns:** \text{last} for the overloads in namespace \text{ranges}.

**Complexity:** Let \( N \) be \( \text{last} - \text{first} \). \( \Theta(N \log N) \) comparisons and projections.

### 25.8.1.2 stable_sort

```cpp
template<class RandomAccessIterator>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator>
void stable_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                 Compare comp);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void stable_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last,
                 Compare comp);
```

```cpp
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
          class Proj = identity>
ranges::stable_sort(I first, S last, Comp comp = {}, Proj proj = {});
```

```cpp
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
borrowed_iterator_t<R>
ranges::stable_sort(R&& r, Comp comp = {}, Proj proj = {});
```

Let \( \text{comp} \) be \text{less{}} and \( \text{proj} \) be \text{identity{}} for the overloads with no parameters by those names.

**Preconditions:** For the overloads in namespace \text{std}, \text{RandomAccessIterator} meets the \text{Cpp17ValueSwappable} requirements (16.5.3.2) and the type of \(*\text{first} \) meets the \text{Cpp17MoveConstructible} (Table 28) and \text{Cpp17MoveAssignable} (Table 30) requirements.

**Effects:** Sorts the elements in the range \([\text{first}, \text{last})\) with respect to \text{comp} and \text{proj}.

**Returns:** \text{last} for the overloads in namespace \text{ranges}.

**Complexity:** Let \( N \) be \( \text{last} - \text{first} \). If enough extra memory is available, \( N \log(N) \) comparisons.

Otherwise, at most \( N \log_2(N) \) comparisons. In either case, twice as many projections as the number of comparisons.

**Remarks:** Stable (16.5.5.8).

### 25.8.1.3 partial_sort

```cpp
template<class RandomAccessIterator>
constexpr void partial_sort(RandomAccessIterator first,
                            RandomAccessIterator middle,
                            RandomAccessIterator last);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator>
void partial_sort(ExecutionPolicy&& exec,
                  RandomAccessIterator first,
                  RandomAccessIterator middle,
                  RandomAccessIterator last);
```

§ 25.8.1.3 ©ISO/IEC 2020 – All rights reserved 1096
template<class RandomAccessIterator, class Compare>
constexpr void partial_sort(RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last,
    Compare comp);

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void partial_sort(ExecutionPolicy&& exec,
    RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last,
    Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
    class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Preconditions: [first, middle) and [middle, last) are valid ranges. For the overloads in namespace std, RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.5.3.2) and the type of *first meets the Cpp17MoveConstructible (Table 28) and Cpp17MoveAssignable (Table 30) requirements.

Effects: Places the first middle - first elements from the range [first, last) as sorted with respect to comp and proj into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

Returns: last for the overload in namespace ranges.

Complexity: Approximately (last - first) * log(middle - first) comparisons, and twice as many projections.

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});

Effects: Equivalent to:
return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);

RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last,
    RandomAccessIterator result_first,
    RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last,
    RandomAccessIterator result_first,
    RandomAccessIterator result_last,
    Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator, class Compare>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last,
RandomAccessIterator result_first,
RandomAccessIterator result_last,
Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2,
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
constexpr ranges::partial_sort_copy_result<I1, I2>
ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, random_access_range R2, class Comp = ranges::less,
class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
sortable<iterator_t<R2>, Comp, Proj2> &&
indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>,
projected<iterator_t<R2>, Proj2>>
constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
ranges::partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
Proj1 proj1 = {}, Proj2 proj2 = {});

Let \( N \) be \( \min(last - first, result_last - result_first) \). Let \( \text{comp} \) be \{\}, and \( \text{proj1} \) and \( \text{proj2} \) be \{\} for the overloads with no parameters by those names.

**Mandates:** For the overloads in namespace std, the expression \(*first\) is writable (23.3.1) to \( result_first \).

**Preconditions:** For the overloads in namespace std, RandomAccessIterator meets the Cpp17Value-Swappable requirements (16.5.3.2), the type of \(*result_first\) meets the Cpp17MoveConstructible (Table 28) and Cpp17MoveAssignable (Table 30) requirements.

**Preconditions:** For iterators \( a1 \) and \( b1 \) in \([first, last)\), and iterators \( x2 \) and \( y2 \) in \([result_first, result_last)\), after evaluating the assignment \(*y2 = *b1\), let \( E \) be the value of

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj1}, *a1), \text{invoke}(\text{proj2}, *y2))).
\]

Then, after evaluating the assignment \(*x2 = *a1\, E\) is equal to

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj2}, *x2, \text{invoke}(\text{proj2}, *y2)))).
\]

[Note: Writing a value from the input range into the output range does not affect how it is ordered by \( \text{comp} \) and \( \text{proj1} \) or \( \text{proj2} \). —end note]

**Effects:** Places the first \( N \) elements as sorted with respect to \( \text{comp} \) and \( \text{proj2} \) into the range \([result_first, result_first + N)\).

**Returns:**

(6.1) \( \text{result_first} + N \) for the overloads in namespace std.

(6.2) \( \{last, result_first + N\} \) for the overloads in namespace ranges.

**Complexity:** Approximately \((last - first) \times \log N\) comparisons, and twice as many projections.

### 25.8.1.5 is_sorted

**template<class ForwardIterator>**

```cpp
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);
```

1 **Effects:** Equivalent to: return is_sorted_until(first, last) == last;

**template<class ExecutionPolicy, class ForwardIterator>**

```cpp
bool is_sorted(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last);
```

2 **Effects:** Equivalent to:

```cpp
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```
template<class ForwardIterator, class Compare>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last, Compare comp);

Effects: Equivalent to: return is_sorted_until(first, last, comp) == last;

Effects: Equivalent to:

return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
    indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
    indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R> ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});

Effects: Equivalent to: return ranges::is_sorted_until(first, last, comp, proj) == last;

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Returns: The last iterator i in [first, last] for which the range [first, i) is sorted with respect to comp and proj.

Complexity: Linear.

25.8.2 Nth element

[alg.nth.element]
template<class RandomAccessIterator, class Compare>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last, Compare comp);

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void nth_element(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last, Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Preconditions: [first, nth) and [nth, last) are valid ranges. For the overloads in namespace std, RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.5.3.2), and the type of *first meets the Cpp17MoveConstructible (Table 28) and Cpp17MoveAssignable (Table 30) requirements.

Effects: After nth_element the element in the position pointed to by nth is the element that would be in that position if the whole range were sorted with respect to comp and proj, unless nth == last. Also for every iterator i in the range [first, nth) and every iterator j in the range [nth, last) it holds that: bool(invoke(comp, invoke(proj, *j), invoke(proj, *i))) is false.

Returns: last for the overload in namespace ranges.

All of the algorithms in this subclause are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

25.8.3.1 lower_bound

All of the algorithms in this subclause are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.
template<forward_range R, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>

constexpr borrowed_iterator_t<R>
ranges::lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

Preconditions: The elements e of [first, last) are partitioned with respect to the expression
bool(invoke(comp, invoke(proj, e), value)).

Returns: The furthermost iterator i in the range [first, last) such that for every iterator j in the
range [first, i), bool(invoke(comp, invoke(proj, *j), value)) is true.

Complexity: At most $\log_2(last - first) + \Theta(1)$ comparisons and projections.

25.8.3.2 upper_bound

template<class ForwardIterator, class T>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>

constexpr I ranges::upper_bound(I first, S last, const T& value, Compare comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

Preconditions: The elements e of [first, last) are partitioned with respect to the expression
!bool(invoke(comp, value, invoke(proj, e))).

Returns: The furthermost iterator i in the range [first, last) such that for every iterator j in the
range [first, i), !bool(invoke(comp, value, invoke(proj, *j))) is true.

Complexity: At most $\log_2(last - first) + \Theta(1)$ comparisons and projections.

25.8.3.3 equal_range

template<class ForwardIterator, class T>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>

constexpr subrange<I>
ranges::equal_range(I first, S last, const T& value, Compare comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

Preconditions: The elements e of [first, last) are partitioned with respect to the expression
!bool(invoke(comp, value, invoke(proj, e))).

Returns: The furthermost iterator i in the range [first, last) such that for every iterator j in the
range [first, i), !bool(invoke(comp, value, invoke(proj, *j))) is true.

Complexity: At most $\log_2(last - first) + \Theta(1)$ comparisons and projections.
ranges::equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

Preconditions: The elements e of [first, last) are partitioned with respect to the expressions
bool(invoke(comp, invoke(proj, e), value)) and !bool(invoke(comp, value, invoke(proj, e))). Also, for all elements e of [first, last), bool(comp(e, value)) implies !bool(comp(value, e)) for the overloads in namespace std.

Returns:
(3.1) For the overloads in namespace std:
{lower_bound(first, last, value, comp),
 upper_bound(first, last, value, comp)}
(3.2) For the overloads in namespace ranges:
{ranges::lower_bound(first, last, value, comp, proj),
 ranges::upper_bound(first, last, value, comp, proj)}

Complexity: At most 2 * log₂(last - first) + O(1) comparisons and projections.

25.8.3.4 binary_search

template<class ForwardIterator, class T>
constexpr bool binary_search(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr bool binary_search(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {},
Proj proj = {});

template<forward_range R, class T, class Proj = identity,
indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {},
Proj proj = {});

Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

Preconditions: The elements e of [first, last) are partitioned with respect to the expressions
bool(invoke(comp, invoke(proj, e), value)) and !bool(invoke(comp, value, invoke(proj, e))). Also, for all elements e of [first, last), bool(comp(e, value)) implies !bool(comp(value, e)) for the overloads in namespace std.

Returns: true if and only if for some iterator i in the range [first, last), !bool(invoke(comp, invoke(proj, *i), value)) && !bool(invoke(comp, value, invoke(proj, *i))) is true.

Complexity: At most log₂(last - first) + O(1) comparisons and projections.

25.8.4 Partitions

template<class InputIterator, class Predicate>
constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool is_partitioned(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
  indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});

1 Let proj be identity{} for the overloads with no parameter named proj.

2 Returns: true if and only if the elements e of [first, last) are partitioned with respect to the
expression bool(invoke(pred, invoke(proj, e))).

3 Complexity: Linear. At most last - first applications of pred and proj.

template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition(ForwardIterator first, ForwardIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator
partition(ExecutionPolicy&& exec,
  ForwardIterator first, ForwardIterator last, Predicate pred);

4 Let proj be identity{} for the overloads with no parameter named proj and let
E(x) = bool(invoke(pred, invoke(proj, x))).

5 Preconditions: For the overloads in namespace std, ForwardIterator meets the Cpp17ValueSwappable
requirements (16.5.3.2).

6 Effects: Places all the elements e in [first, last) that satisfy E(e) before all the elements that do not.

7 Returns: Let i be an iterator such that E(*j) is true for every iterator j in [first, i) and false
for every iterator j in [i, last). Returns:

(7.1) — i for the overloads in namespace std.

(7.2) — {i, last} for the overloads in namespace ranges.

8 Complexity: Let N = last - first:

(8.1) — For the overload with no ExecutionPolicy, exactly N applications of the predicate and projection.
At most N/2 swaps if the type of first meets the Cpp17BidirectionalIterator requirements for the
overloads in namespace std or models bidirectional_iterator for the overlords in namespace
ranges, and at most N swaps otherwise.

(8.2) — For the overload with an ExecutionPolicy, O(N log N) swaps and O(N) applications of the
predicate.

template<class BidirectionalIterator, class Predicate>
BidirectionalIterator
stable_partition(BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
BidirectionalIterator
stable_partition(ExecutionPolicy&& exec,
  BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,
  indirect_unary_predicate<projected<I, Proj>> Pred>
requires permutable<I>
subrange<I> ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});
template<bidirectional_range R, class Proj = identity, indirect_unary_predicate<projected<iterator_t<R>>, Proj>> Pred>
requires permutable<iterator_t<R>>
borrowed_subrange_t<R> ranges::stable_partition(R&& r, Pred pred, Proj proj = {});

Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoke(pred, invoke(proj, x))).

Preconditions: For the overloads in namespace std, BidirectionalIterator meets the Cpp17ValueSwappable requirements (16.5.3.2) and the type of *first meets the Cpp17MoveConstructible (Table 28) and Cpp17MoveAssignable (Table 30) requirements.

Effects: Places all the elements e in [first, last) that satisfy E(e) before all the elements that do not. The relative order of the elements in both groups is preserved.

Returns: Let i be an iterator such that for every iterator j in [first, i), E(*j) is true, and for every iterator j in the range [i, last), E(*j) is false. Returns:

- i for the overloads in namespace std.
- {i, last} for the overloads in namespace ranges.

Complexity: Let N = last - first:

- For the overloads with no ExecutionPolicy, at most N log N swaps, but only O(N) swaps if there is enough extra memory. Exactly N applications of the predicate and projection.
- For the overload with an ExecutionPolicy, O(N log N) swaps and O(N) applications of the predicate.

Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoke(pred, invoke(proj, x))).

Mandates: For the overloads in namespace std, the expression *first is writable (23.3.1) to out_true and out_false.

Preconditions: The input range and output ranges do not overlap.

[Note: For the overload with an ExecutionPolicy, there may be a performance cost if first’s value type does not meet the Cpp17CopyConstructible requirements. — end note]

Effects: For each iterator i in [first, last), copies *i to the output range beginning with out_true if E(*i) is true, or to the output range beginning with out_false otherwise.
Returns: Let \( o1 \) be the end of the output range beginning at \( \text{out\_true} \), and \( o2 \) the end of the output range beginning at \( \text{out\_false} \). Returns

- \( \{o1, o2\} \) for the overloads in namespace std.
- \( \{\text{last}, o1, o2\} \) for the overloads in namespace ranges.

Complexity: Exactly \( \text{last} - \text{first} \) applications of \( \text{pred} \) and \( \text{proj} \).

```
template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
           indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr I ranges::partition_point(I first, S last, Pred pred, Proj proj = {});
```

```
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
            weakly_incrementable O, class Comp = ranges::less, class Proj1 = identity,
            class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<I1, I2, O>
ranges::merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```
template<input_range R1, input_range R2, weakly_incrementable O, class Comp = ranges::less,
   class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::merge(R1&& r1, R2&& r2, O result,
   Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
1
Let $N$ be $(\text{last1} - \text{first1}) + (\text{last2} - \text{first2})$. Let $\text{comp}$ be $\text{less}\{}$, $\text{proj1}$ be $\text{identity}\{}$, and $\text{proj2}$ be $\text{identity}\{}$, for the overloads with no parameters by those names.
2
Preconditions: The ranges $[\text{first1}, \text{last1})$ and $[\text{first2}, \text{last2})$ are sorted with respect to $\text{comp}$ and $\text{proj1}$ or $\text{proj2}$, respectively. The resulting range does not overlap with either of the original ranges.
3
Effects: Copies all the elements of the two ranges $[\text{first1}, \text{last1})$ and $[\text{first2}, \text{last2})$ into the range $[\text{result}, \text{result_last})$, where $\text{result_last}$ is $\text{result} + N$. If an element $a$ precedes $b$ in an input range, $a$ is copied into the output range before $b$. If $e_1$ is an element of $[\text{first1}, \text{last1})$ and $e_2$ of $[\text{first2}, \text{last2})$, $e_2$ is copied into the output range before $e_1$ if and only if $\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj2}, e_2), \text{invoke}(\text{proj1}, e_1)))$ is true.
4
Returns:

(4.1) — $\text{result_last}$ for the overloads in namespace $\text{std}$.
(4.2) — $[\text{last1}, \text{last2}, \text{result_last})$ for the overloads in namespace $\text{ranges}$.
5
Complexity:

(5.1) — For the overloads with no $\text{ExecutionPolicy}$, at most $N - 1$ comparisons and applications of each projection.
(5.2) — For the overloads with an $\text{ExecutionPolicy}$, $O(N)$ comparisons.
6
Remarks: Stable (16.5.5.8).

template<class BidirectionalIterator>
void inplace_merge(BidirectionalIterator first,
   BidirectionalIterator middle, BidirectionalIterator last);

template<class ExecutionPolicy, class BidirectionalIterator>
void inplace_merge(ExecutionPolicy&& exec, BidirectionalIterator first, BidirectionalIterator middle, BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
void inplace_merge(BidirectionalIterator first, BidirectionalIterator middle, BidirectionalIterator last, Compare comp);

template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
void inplace_merge(ExecutionPolicy&& exec, BidirectionalIterator first, BidirectionalIterator middle, BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
   class Proj = identity>
I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});
7
Let $\text{comp}$ be $\text{less}\{}$ and $\text{proj}$ be $\text{identity}\{}$ for the overloads with no parameters by those names.
8
Preconditions: $[\text{first}, \text{middle})$ and $[\text{middle}, \text{last})$ are valid ranges sorted with respect to $\text{comp}$ and $\text{proj}$. For the overloads in namespace $\text{std}$,$\text{BidirectionalIterator}$ meets the $\text{Cpp17ValueSwappable}$ requirements (16.5.3.2) and the type of $\ast \text{first}$ meets the $\text{Cpp17MoveConstructible}$ (Table 28) and $\text{Cpp17MoveAssignable}$ (Table 30) requirements.
9
Effects: Merges two sorted consecutive ranges $[\text{first}, \text{middle})$ and $[\text{middle}, \text{last})$, putting the result of the merge into the range $[\text{first}, \text{last})$. The resulting range is sorted with respect to $\text{comp}$ and $\text{proj}$.
Returns: `last` for the overload in namespace `ranges`.

Complexity: Let \( N = \text{last} - \text{first} \):

- For the overloads with no `ExecutionPolicy`, and if enough additional memory is available, exactly \( N - 1 \) comparisons.
- Otherwise, \( \mathcal{O}(N \log N) \) comparisons.

In either case, twice as many projections as comparisons.

Remarks: Stable (16.5.5.8).

```cpp
template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

Effects: Equivalent to:

```cpp
return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

25.8.6 Set operations on sorted structures

This subclause defines all the basic set operations on sorted structures. They also work with `multisets` (22.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to `multisets` in a standard way by defining `set_union` to contain the maximum number of occurrences of every element, `set_intersection` to contain the minimum, and so on.

25.8.6.1 `includes`

```cpp
template<class InputIterator1, class InputIterator2>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                         InputIterator2 first2, InputIterator2 last2);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool includes(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2);
```

```cpp
template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2,
                        Compare comp);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
bool includes(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              Compare comp);
```

```cpp
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>,
         projected<I2, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {},
                                Proj1 proj1 = {}, Proj2 proj2 = {});
```

```cpp
template<input_range R1, input_range R2, class Proj1 = identity,
         class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
         projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {},
                                Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let `comp` be `less()` and `proj1` be `identity()`, and `proj2` be `identity()`, for the overloads with no parameters by those names.

Preconditions: The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively.
Returns: true if and only if \([\text{first}_2, \text{last}_2)\) is a subsequence of \([\text{first}_1, \text{last}_1)\). [Note: A sequence \(S\) is a subsequence of another sequence \(T\) if \(S\) can be obtained from \(T\) by removing some, all, or none of \(T\)'s elements and keeping the remaining elements in the same order. — end note]

Complexity: At most \(2 \times ((\text{last}_1 - \text{first}_1) + (\text{last}_2 - \text{first}_2)) - 1\) comparisons and applications of each projection.

25.8.6.2 set_union

\texttt{template\langle class InputIterator1, class InputIterator2, class OutputIterator\rangle}
\texttt{constexpr OutputIterator set_union(InputIterator1 \text{first}_1, InputIterator1 \text{last}_1, InputIterator2 \text{first}_2, InputIterator2 \text{last}_2, OutputIterator result);};

\texttt{template\langle class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class ForwardIterator\rangle}
\texttt{ForwardIterator set_union(ExecutionPolicy&& \text{exec}, ForwardIterator1 \text{first}_1, ForwardIterator1 \text{last}_1, ForwardIterator2 \text{first}_2, ForwardIterator2 \text{last}_2, ForwardIterator result);};

\texttt{template\langle class InputIterator1, class InputIterator2, class OutputIterator, class Compare\rangle}
\texttt{constexpr OutputIterator set_union(InputIterator1 \text{first}_1, InputIterator1 \text{last}_1, InputIterator2 \text{first}_2, InputIterator2 \text{last}_2, OutputIterator result, Compare \text{comp});}

\texttt{template\langle class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class ForwardIterator, class Compare\rangle}
\texttt{ForwardIterator set_union(ExecutionPolicy&& \text{exec}, ForwardIterator1 \text{first}_1, ForwardIterator1 \text{last}_1, ForwardIterator2 \text{first}_2, ForwardIterator2 \text{last}_2, ForwardIterator result, Compare \text{comp});}

\texttt{template\langle input_iterator I1, sentinel_for\langle I1\rangle S1, input_iterator I2, sentinel_for\langle I2\rangle S2, weakly_incrementable O, class Comp = ranges\::\less, class Proj1 = identity, class Proj2 = identity\rangle}
\texttt{constexpr ranges\::set_union_result\langle I1, I2, O\rangle\text{ranges}\::\text{set_union}(I1 \text{first}_1, S1 \text{last}_1, I2 \text{first}_2, S2 \text{last}_2, 0 \text{result}, \text{Comp comp} = \{\}, \text{Proj1 proj1} = \{\}, \text{Proj2 proj2} = \{\});}

\texttt{template\langle input_range R1, input_range R2, weakly_incrementable O, class Comp = ranges\::\less, class Proj1 = identity, class Proj2 = identity\rangle}
\texttt{constexpr ranges\::set_union_result\langle borrowed_iterator_t\langle R1\rangle, borrowed_iterator_t\langle R2\rangle, O, \text{Comp comp} = \{\}, \text{Proj1 proj1} = \{\}, \text{Proj2 proj2} = \{\});}

Let \text{comp} be \text{less}\{\}, and \text{proj1} and \text{proj2} be \text{identity}\{\} for the overloads with no parameters by those names.

Preconditions: The ranges \([\text{first}_1, \text{last}_1)\) and \([\text{first}_2, \text{last}_2)\) are sorted with respect to \text{comp} and \text{proj1} or \text{proj2}, respectively. The resulting range does not overlap with either of the original ranges.

Effects: Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.

Returns: Let \text{result}_\text{last} be the end of the constructed range. Returns

\begin{itemize}
\item \text{result}_\text{last} for the overloads in namespace \text{std}.
\item \{\text{last}_1, \text{last}_2, \text{result}_\text{last}\} for the overloads in namespace \text{ranges}.
\end{itemize}
Complexity: At most \(2 \times ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1\) comparisons and applications of each projection.

Remarks: Stable (16.5.5.8). If \([\text{first1}, \text{last1})\) contains \(m\) elements that are equivalent to each other and \([\text{first2}, \text{last2})\) contains \(n\) elements that are equivalent to them, then all \(m\) elements from the first range are copied to the output range, in order, and then the final \(\max(n - m, 0)\) elements from the second range are copied to the output range, in order.

25.8.6.3 \texttt{set_intersection}

\[
\text{template<class InputIterator1, class InputIterator2,  
constexpr OutputIterator>  
set_intersection(InputIterator1 first1, InputIterator1 last1,  
InputIterator2 first2, InputIterator2 last2,  
OutputIterator result);}  
\]

\[
\text{template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,  
const ForwardIterator>  
set_intersection(ExecutionPolicy&& exec,  
ForwardIterator1 first1, ForwardIterator1 last1,  
ForwardIterator2 first2, ForwardIterator2 last2,  
ForwardIterator result);}  
\]

\[
\text{template<class InputIterator1, class InputIterator2,  
constexpr OutputIterator, class Compare>  
set_intersection(InputIterator1 first1, InputIterator1 last1,  
InputIterator2 first2, InputIterator2 last2,  
OutputIterator result, Compare comp);}  
\]

\[
\text{template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,  
const ForwardIterator, class Compare>  
set_intersection(ExecutionPolicy&& exec,  
ForwardIterator1 first1, ForwardIterator1 last1,  
ForwardIterator2 first2, ForwardIterator2 last2,  
ForwardIterator result, Compare comp);}  
\]

\[
\text{template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,  
weakly_incrementable O, class Comp = ranges::less,  
class Proj1 = identity, class Proj2 = identity>  
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>  
constexpr ranges::set_intersection_result<I1, I2, O>  
ranges::set_intersection_result<\text{I1} first1, \text{I1} last1, \text{I2} first2, \text{S2} last2, O result,  
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});  
\]

\[
\text{template<input_range R1, input_range R2, weakly_incrementable O,  
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>  
requires mergeable<\text{iterator_t<R1>}, \text{iterator_t<R2>}, O, Comp, Proj1, Proj2>  
constexpr ranges::set_intersection_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>  
ranges::set_intersection_result<\text{R1\&\& r1, R2\&\& r2, O result,  
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});  
\]

1. Let \(\text{comp}\) be \texttt{less{}}, and \(\text{proj1}\) and \(\text{proj2}\) be \texttt{identity{}} for the overloads with no parameters by those names.

2. Preconditions: The ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) are sorted with respect to \(\text{comp}\) and \(\text{proj1}\) or \(\text{proj2}\), respectively. The resulting range does not overlap with either of the original ranges.

3. Effects: Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.

4. Returns: Let \(\text{result\_last}\) be the end of the constructed range. Returns
   \begin{itemize}
   \item \(\text{result\_last}\) for the overloads in namespace \texttt{std}.
   \item \([\text{last1}, \text{last2}, \text{result\_last})\) for the overloads in namespace \texttt{ranges}.
   \end{itemize}
Complexity: At most \(2 \times ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1\) comparisons and applications of each projection.

Remarks: Stable (16.5.5.8). If \([\text{first1}, \text{last1})\) contains \(m\) elements that are equivalent to each other and \([\text{first2}, \text{last2})\) contains \(n\) elements that are equivalent to them, the first \(\min(m, n)\) elements are copied from the first range to the output range, in order.

25.8.6.4 set_difference

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator set_difference(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2, OutputIterator result);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class ForwardIterator>
ForwardIterator set_difference(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2, ForwardIterator result);
```

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator set_difference(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2, OutputIterator result, Compare comp);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class ForwardIterator, class Compare>
ForwardIterator set_difference(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2, ForwardIterator result, Compare comp);
```

```cpp
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, weakly_incrementable O, class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<I1, O> ranges::set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let \(\text{comp}\) be \text{less}\{\}, and \(\text{proj1}\) and \(\text{proj2}\) be \text{identity}\{\} for the overloads with no parameters by those names.

Preconditions: The ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) are sorted with respect to \(\text{comp}\) and \(\text{proj1}\) or \(\text{proj2}\), respectively. The resulting range does not overlap with either of the original ranges.

Effects: Copies the elements of the range \([\text{first1}, \text{last1})\) which are not present in the range \([\text{first2}, \text{last2})\) to the range beginning at \(\text{result}\). The elements in the constructed range are sorted.

Returns: Let \text{result\_last} be the end of the constructed range. Returns

```cpp
- \text{result\_last} for the overloads in namespace std.
- \{\text{last1}, \text{result\_last}\} for the overloads in namespace ranges.
```
**Complexity:** At most \(2 \times ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1\) comparisons and applications of each projection.

**Remarks:** If \([\text{first1}, \text{last1})\) contains \(m\) elements that are equivalent to each other and \([\text{first2}, \text{last2})\) contains \(n\) elements that are equivalent to them, the last \(\max(m - n, 0)\) elements from \([\text{first1}, \text{last1})\) is copied to the output range, in order.

### 25.8.6.5 `set_symmetric_difference`

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                                                 InputIterator2 first2, InputIterator2 last2,
                                                 OutputIterator result);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator>
ForwardIterator set_symmetric_difference(ExecutionPolicy&& exec,
                                        ForwardIterator1 first1, ForwardIterator1 last1,
                                        ForwardIterator2 first2, ForwardIterator2 last2,
                                        ForwardIterator result);
```

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                                                 InputIterator2 first2, InputIterator2 last2,
                                                 OutputIterator result, Compare comp);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator, class Compare>
ForwardIterator set_symmetric_difference(ExecutionPolicy&& exec,
                                        ForwardIterator1 first1, ForwardIterator1 last1,
                                        ForwardIterator2 first2, ForwardIterator2 last2,
                                        ForwardIterator result, Compare comp);
```

```cpp
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
weakly_incrementable O, class Comp = ranges::less,
class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<I1, I2, O>
ranges::set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                                 Comp comp = {}, Proj1 proj1 = {},
                                 Proj2 proj2 = {});
```

```cpp
template<input_range R1, input_range R2, weakly_incrementable O,
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<borrowed_iterator_t<R1>,
                                                 borrowed_iterator_t<R2>, O>
ranges::set_symmetric_difference(R1&& r1, R2&& r2, O result, Comp comp = {},
                                 Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let \(\text{comp}\) be \(\text{less}\), and \(\text{proj1}\) and \(\text{proj2}\) be \(\text{identity}\) for the overloads with no parameters by those names.

**Preconditions:** The ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) are sorted with respect to \(\text{comp}\) and \(\text{proj1}\) or \(\text{proj2}\), respectively. The resulting range does not overlap with either of the original ranges.

**Effects:** Copies the elements of the range \([\text{first1}, \text{last1})\) that are not present in the range \([\text{first2}, \text{last2})\), and the elements of the range \([\text{first2}, \text{last2})\) that are not present in the range \([\text{first1}, \text{last1})\) to the range beginning at \(\text{result}\). The elements in the constructed range are sorted.

**Returns:** Let \(\text{result\_last}\) be the end of the constructed range. Returns

\[(\text{result\_last})\] for the overloads in namespace std.
— \{last1, last2, result_last\} for the overloads in namespace \texttt{ranges}.

\textbf{Complexity:} At most \(2 \times ((last1 - first1) + (last2 - first2)) - 1\) comparisons and applications of each projection.

\textbf{Remarks:} Stable (16.5.5.8). If \([first1, last1)\) contains \(m\) elements that are equivalent to each other and \([first2, last2)\) contains \(n\) elements that are equivalent to them, then \(|m - n|\) of those elements shall be copied to the output range: the last \(m - n\) of these elements from \([first1, last1)\) if \(m > n\), and the last \(n - m\) of these elements from \([first2, last2)\) if \(m < n\). In either case, the elements are copied in order.

\section{25.8.7 Heap operations} \label{alg.heap.operations}

A random access range \([a, b)\) is a heap with respect to \texttt{comp} and \texttt{proj} for a comparator and projection \texttt{comp} and \texttt{proj} if its elements are organized such that:

\begin{enumerate}
\item With \(N = b - a\), for all \(i, 0 < i < N\), \texttt{bool} (\texttt{invoke(comp, invoke(proj, a[\lfloor (i-1)/2 \rfloor]), invoke(proj, a[i]))}) is false.
\item \(*a\) may be removed by \texttt{pop_heap}, or a new element added by \texttt{push_heap}, in \(\Theta(\log N)\) time.
\end{enumerate}

These properties make heaps useful as priority queues.

\texttt{make_heap} converts a range into a heap and \texttt{sort_heap} turns a heap into a sorted sequence.

\subsection{25.8.7.1 \texttt{push_heap}} \label{push.heap}

\begin{Verbatim}
\template<class RandomAccessIterator>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);
\end{Verbatim}

\begin{Verbatim}
\template<class RandomAccessIterator, class Compare>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last, Compare comp);
\end{Verbatim}

\begin{Verbatim}
\template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>
\texttt{requires sortable}\texttt{<I, Comp, Proj>}
\constexpr I \ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});
\end{Verbatim}

Let \texttt{comp} be \texttt{less\{} and \texttt{proj} be \texttt{identity\{} for the overloads with no parameters by those names.

\textbf{Preconditions:} The range \([first, last - 1)\) is a valid heap with respect to \texttt{comp} and \texttt{proj}. For the overloads in namespace \texttt{std}, the type of \(*first\) meets the \texttt{Cpp17MoveConstructible} requirements (Table 28) and the \texttt{Cpp17MoveAssignible} requirements (Table 30).

\textbf{Effects:} Places the value in the location \texttt{last - 1} into the resulting heap \([first, last)\).

\textbf{Returns:} \texttt{last} for the overloads in namespace \texttt{ranges}.

\textbf{Complexity:} At most \(\log(last - first)\) comparisons and twice as many projections.

\subsection{25.8.7.2 \texttt{pop_heap}} \label{pop.heap}

\begin{Verbatim}
\template<class RandomAccessIterator>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);
\end{Verbatim}

\begin{Verbatim}
\template<class RandomAccessIterator, class Compare>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last, Compare comp);
\end{Verbatim}

\begin{Verbatim}
\template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>
\texttt{requires sortable}\texttt{<I, Comp, Proj>}
\constexpr I \ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});
\end{Verbatim}

\begin{Verbatim}
\template<random_access_range R, class Comp = ranges::less, class Proj = identity>
\texttt{requires sortable}\texttt{<iterator_t<R>, Comp, Proj>}
\texttt{borrowed_iterator_t<R>}
\ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});
\end{Verbatim}
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
2 Preconditions: The range [first, last) is a valid non-empty heap with respect to comp and proj. For the overloads in namespace std, RandomAccessIterator meets the Cpp17ValueSwapable requirements (16.5.3.2) and the type of *first meets the Cpp17MoveConstructible (Table 28) and Cpp17MoveAssignable (Table 30) requirements.
3 Effects: Swaps the value in the location first with the value in the location last - 1 and makes [first, last - 1) into a heap with respect to comp and proj.
4 Returns: last for the overloads in namespace ranges.
5 Complexity: At most \( \log_2(\text{last} - \text{first}) \) comparisons and twice as many projections.

25.8.7.3 make_heap

template<class RandomAccessIterator>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last, Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::make_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::make_heap(R&& r, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
2 Preconditions: For the overloads in namespace std, the type of *first meets the Cpp17MoveConstructible (Table 28) and Cpp17MoveAssignable (Table 30) requirements.
3 Effects: Constructs a heap with respect to comp and proj out of the range [first, last).
4 Returns: last for the overloads in namespace ranges.
5 Complexity: At most \( 3(\text{last} - \text{first}) \) comparisons and twice as many projections.

25.8.7.4 sort_heap

template<class RandomAccessIterator>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last, Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::sort_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
Preconditions: The range \([\text{first}, \text{last})\) is a valid heap with respect to \texttt{comp} and \texttt{proj}. For the overloads in namespace \texttt{std}, \texttt{RandomAccessIterator} meets the \texttt{Cpp17ValueSwappable} requirements (16.5.3.2) and the type of \*\texttt{first} meets the \texttt{Cpp17MoveConstructible} (Table 28) and \texttt{Cpp17MoveAssignable} (Table 30) requirements.

Effects: Sorts elements in the heap \([\text{first}, \text{last})\) with respect to \texttt{comp} and \texttt{proj}.

Returns: \texttt{last} for the overloads in namespace \texttt{ranges}.

Complexity: At most \(2N \log N\) comparisons, where \(N = \text{last} - \text{first}\), and twice as many projections.

## 25.8.7.5 \texttt{is_heap}

```
template<class RandomAccessIterator>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);
```

Effects: Equivalent to: \(\text{return is_heap_until(first, last) == last}\);

```
template<class ExecutionPolicy, class RandomAccessIterator>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last);
```

Effects: Equivalent to:
\[
\text{return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;}
\]

```
template<class RandomAccessIterator, class Compare>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);
```

Effects: Equivalent to:
\[
\text{return is_heap_until(first, last, comp) == last;}
\]

```
template<class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
                                             Compare comp);
```

Effects: Equivalent to:
\[
\text{return ranges::is_heap_until(first, last, comp, proj) == last;}
\]

---

§ 25.8.7.5 © ISO/IEC 2020 – All rights reserved 1114
template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
    indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Proj = identity,
    indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});

Let \( \text{comp} \) be \( \text{less}() \) and \( \text{proj} \) be \( \text{identity}() \) for the overloads with no parameters by those names.

Returns: The last iterator \( i \) in \([\text{first}, \text{last}]\) for which the range \([\text{first}, i)\) is a heap with respect to \( \text{comp} \) and \( \text{proj} \).

Complexity: Linear.

### 25.8.8 Minimum and maximum

[alg.min.max]

template<class T>
constexpr const T& min(const T& a, const T& b);
template<T, class Compare>
constexpr const T& min(const T& a, const T& b, Compare comp);

template<T, class Proj = identity,
    indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});

Preconditions: For the first form, \( T \) meets the \text{Cpp17LessThanComparable} requirements (Table 26).

Returns: The smaller value.

Remarks: Returns the first argument when the arguments are equivalent. An invocation may explicitly specify an argument for the template parameter \( T \) of the overloads in namespace \text{std}.

Complexity: Exactly one comparison and two applications of the projection, if any.

template<T>
constexpr T min(initializer_list<T> r);
template<T, class Compare>
constexpr T min(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
    indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
    indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>>
constexpr range_value_t<R>
ranges::min(R&& r, Comp comp = {}, Proj proj = {});

Preconditions: \text{ranges::distance}(r) > 0. For the overloads in namespace \text{std}, \( T \) meets the \text{Cpp17CopyConstructible} requirements. For the first form, \( T \) meets the \text{Cpp17LessThanComparable} requirements (Table 26).

Returns: The smallest value in the input range.

Remarks: Returns a copy of the leftmost element when several elements are equivalent to the smallest. An invocation may explicitly specify an argument for the template parameter \( T \) of the overloads in namespace \text{std}.

Complexity: Exactly \text{ranges::distance}(r) - 1 comparisons and twice as many applications of the projection, if any.

template<T>
constexpr const T& max(const T& a, const T& b);
template<T, class Compare>
constexpr const T& max(const T& a, const T& b, Compare comp);
template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
const expr const T ranges::max(const T& a, const T& b, Comp comp = {}, Proj proj = {});

Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 26).
Returns: The larger value.
Remarks: Returns the first argument when the arguments are equivalent. An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.
Complexity: Exactly one comparison and two applications of the projection, if any.

template<class T>
const expr T max(initializer_list<T> r);
template<class T, class Compare>
const expr T max(initializer_list<T> r, Compare compare);

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
const expr T ranges::max(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
const expr range_value_t<R> ranges::max(R&& r, Comp comp = {}, Proj proj = {});

Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17CopyConstructible requirements. For the first form, T meets the Cpp17LessThanComparable requirements (Table 26).
Returns: The largest value in the input range.
Remarks: Returns a copy of the leftmost element when several elements are equivalent to the largest. An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.
Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the projection, if any.

template<class T>
const expr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
const expr pair<const T&, const T&> minmax(const T& a, const T& b, Compare compare);

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
const expr ranges::minmax_result<const T&>
ranges::minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});

Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 26).
Returns: {b, a} if b is smaller than a, and {a, b} otherwise.
Remarks: An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.
Complexity: Exactly one comparison and two applications of the projection, if any.

template<class T>
const expr pair<T, T> minmax(initializer_list<T> t);
template<class T, class Compare>
const expr pair<T, T> minmax(initializer_list<T> t, Compare compare);

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
const expr ranges::minmax_result<T>
ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
   indirect_strict_weak_order<projected<iterator_t<R>>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>>
constexpr ranges::minmax_result<range_value_t<R>>
ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});

Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
CopyConstructible requirements. For the first form, type T meets the Cpp17LessThanComparable
requirements (Table 26).
Returns: Let X be the return type. Returns X(x, y), where x is a copy of the leftmost element with
the smallest value and y a copy of the rightmost element with the largest value in the input range.
Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.
Complexity: At most (3/2)\texttt{ranges::distance(r)} applications of the corresponding predicate and twice
as many applications of the projection, if any.

template<class ForwardIterator>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator min_element(ExecutionPolicy&& exec,
   ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
   Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator min_element(ExecutionPolicy&& exec,
   ForwardIterator first, ForwardIterator last,
   Compare comp);

Let \texttt{comp} be \texttt{less{}} and \texttt{proj} be \texttt{identity{}} for the overloads with no parameters by those names.

Returns: The first iterator i in the range \texttt{[first, last)} such that for every iterator j in the range
\texttt{[first, last)},
\[ \texttt{bool(invoke(comp, invoke(proj, *j), invoke(proj, *i)))} \]
is false. Returns last if first == last.
Complexity: Exactly max(last - first - 1, 0) comparisons and twice as many projections.

template<class ForwardIterator>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator max_element(ExecutionPolicy&& exec,
   ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last,
   Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator max_element(ExecutionPolicy&& exec,
   ForwardIterator first, ForwardIterator last,
   Compare comp);
template<forward_iterator I, sentinel_for<I> S, class Proj = identity, 
    indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less> 
constexpr I ranges::max_element(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity, 
    indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R> 
ranges::max_element(R&& r, Comp comp = {}, Proj proj = {});

Let \( \text{comp} \) be \( \text{less}{} \) and \( \text{proj} \) be \( \text{identity}{} \) for the overloads with no parameters by those names.

Returns: The first iterator \( i \) in the range \([\text{first}, \text{last})\) such that for every iterator \( j \) in the range \([\text{first}, \text{last})\),

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, \ast i), \text{invoke}(\text{proj}, \ast j)))
\]

is false. Returns last if \( \text{first} == \text{last} \).

Complexity: Exactly \( \max(\text{last} - \text{first} - 1, 0) \) comparisons and twice as many projections.

template<class ForwardIterator>
constexpr pair<ForwardIterator, ForwardIterator> 
minmax_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
pair<ForwardIterator, ForwardIterator> 
minmax_element(ExecutionPolicy&& exec, 
    ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr pair<ForwardIterator, ForwardIterator> 
minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
pair<ForwardIterator, ForwardIterator> 
minmax_element(ExecutionPolicy&& exec, 
    ForwardIterator first, ForwardIterator last, Compare comp);

25.8.9 Bounded value

template<class T> 
constexpr const T& clamp(const T& v, const T& lo, const T& hi);

template<class T, class Compare>
constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);

template<class T, class Proj = identity, 
    indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less> 
constexpr const T& 
ranges::clamp(const T& v, const T& lo, const T& hi, Comp comp = {}, Proj proj = {});

Let \( \text{comp} \) be \( \text{less}{} \) for the overloads with no parameter \( \text{comp} \), and let \( \text{proj} \) be \( \text{identity}{} \) for the overloads with no parameter \( \text{proj} \).

Preconditions: \( \text{bool}(\text{comp}(\text{proj}(\text{hi}), \text{proj}(\text{lo}))) \) is false. For the first form, type \( T \) meets the Cpp17LessThanComparable requirements (Table 26).
Returns: \( \text{lo} \) if \( \text{bool}(\text{comp}(\text{proj}(\text{v}), \text{proj}(\text{lo}))) \) is true, \( \text{hi} \) if \( \text{bool}(\text{comp}(\text{proj}(\text{hi}), \text{proj}(\text{v}))) \) is true, otherwise \( \text{v} \).

[Note: If NaN is avoided, \( T \) can be a floating-point type. — end note]

Complexity: At most two comparisons and three applications of the projection.

25.8.10 Lexicographical comparison

\[
\text{template<class InputIterator1, class InputIterator2>}
\text{constexpr bool}
\text{lexicographical_compare(InputIterator1 first1, InputIterator1 last1,}
\text{InputIterator2 first2, InputIterator2 last2);}
\]

\[
\text{template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>}
\text{bool}
\text{lexicographical_compare(ExecutionPolicy&& exec,}
\text{ForwardIterator1 first1, ForwardIterator1 last1,}
\text{ForwardIterator2 first2, ForwardIterator2 last2);}
\]

\[
\text{template<class InputIterator1, class InputIterator2, class Compare>}
\text{constexpr bool}
\text{lexicographical_compare(InputIterator1 first1, InputIterator1 last1,}
\text{InputIterator2 first2, InputIterator2 last2,}
\text{Compare comp);} 
\]

\[
\text{template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
\text{bool}
\text{lexicographical_compare(ExecutionPolicy&& exec,}
\text{ForwardIterator1 first1, ForwardIterator1 last1,}
\text{ForwardIterator2 first2, ForwardIterator2 last2,}
\text{Compare comp);} 
\]

\[
\text{template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,}
\text{class Proj1 = identity, class Proj2 = identity,}
\text{indirect_strict_weak_order<projected<I1, Proj1>,}
\text{projected<I2, Proj2>> Comp = ranges::less>}
\text{constexpr bool}
\text{ranges::lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,}
\text{Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {}};}
\]

\[
\text{template<input_range R1, input_range R2, class Proj1 = identity,}
\text{class Proj2 = identity,}
\text{indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,}
\text{projected<iterator_t<R2>, Proj2>> Comp = ranges::less>}
\text{constexpr bool}
\text{ranges::lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},}
\text{Proj1 proj1 = {}, Proj2 proj2 = {}};}
\]

Returns: \( \text{true} \) if and only if the sequence of elements defined by the range \([\text{first1}, \text{last1})\) is lexicographically less than the sequence of elements defined by the range \([\text{first2}, \text{last2})\).

Complexity: At most \( 2 \min(\text{last1} - \text{first1}, \text{last2} - \text{first2}) \) applications of the corresponding comparison and each projection, if any.

Remarks: If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence. Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

[Example: \( \text{ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2)} \) could be implemented as:

\[
\text{for ( ; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {}
\text{if (invoke(comp, invoke(proj1, first1), invoke(proj2, first2))) return true;}
\text{if (invoke(comp, invoke(proj2, first2), invoke(proj1, first1))) return false;}
\text{}}
\text{return first1 == last1 && first2 != last2;}
\]
25.8.11 Three-way comparison algorithms

```cpp
template<class InputIterator1, class InputIterator2, class Cmp>
constexpr auto lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
InputIterator2 b2, InputIterator2 e2,
Cmp comp)
-> decltype(comp(*b1, *b2));
```

**Mandates:** `decltype(comp(*b1, *b2))` is a comparison category type.

**Effects:** Lexicographically compares two ranges and produces a result of the strongest applicable comparison category type. Equivalent to:

```cpp
for ( ; b1 != e1 && b2 != e2; void(++b1), void(++b2) )
if (auto cmp = comp(*b1,*b2); cmp != 0)
    return cmp;
return b1 != e1 ? strong_ordering::greater :
b2 != e2 ? strong_ordering::less :
    strong_ordering::equal;
```

```cpp
template<class InputIterator1, class InputIterator2>
constexpr auto lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
InputIterator2 b2, InputIterator2 e2);
```

**Effects:** Equivalent to:

```cpp
return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());
```

25.8.12 Permutation generators

```cpp
template<class BidirectionalIterator>
constexpr bool next_permutation(BidirectionalIterator first,
    BidirectionalIterator last);
```

```cpp
template<class BidirectionalIterator, class Compare>
constexpr bool next_permutation(BidirectionalIterator first,
    BidirectionalIterator last, Compare comp);
```

```cpp
template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
    class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::next_permutation_result<I>
ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
```

```cpp
template<bidirectional_range R, class Comp = ranges::less,
    class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr ranges::next_permutation_result<borrowed_iterator_t<R>>
ranges::next_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

1. Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2. **Preconditions:** For the overloads in namespace `std`, `BidirectionalIterator` meets the `Cpp17ValueSwappable` requirements (16.5.3.2).

3. **Effects:** Takes a sequence defined by the range `[first, last)` and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

4. **Returns:** Let `B` be `true` if a next permutation was found and otherwise `false`. Returns:

   - `B` for the overloads in namespace `std`.
   - `{ last, B }` for the overloads in namespace `ranges`.

§ 25.8.12 ©ISO/IEC 2020 – All rights reserved
template<class BidirectionalIterator>
constexpr bool prev_permutation(BidirectionalIterator first,
BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool prev_permutation(BidirectionalIterator first,
BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::prev_permutation_result<I>
ranges::prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});

template<bidirectional_range R, class Comp = ranges::less,
class Proj = identity>
requires sortable<iterator_t<R>>, Comp, Proj>
constexpr ranges::prev_permutation_result<borrowed_iterator_t<R>>
ranges::prev_permutation(R&& r, Comp comp = {}, Proj proj = {});

Let \texttt{comp} be \texttt{less{}} and \texttt{proj} be \texttt{identity{}} for overloads with no parameters by those names.

Preconditions: For the overloads in namespace \texttt{std}, \texttt{BidirectionalIterator} meets the \texttt{Cpp17Value-Swappable} requirements (16.5.3.2).

Effects: Takes a sequence defined by the range \texttt{[first, last)} and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to \texttt{comp} and \texttt{proj}. If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

Returns: Let \texttt{B} be \texttt{true} if a previous permutation was found and otherwise \texttt{false}. Returns:

- \texttt{B} for the overloads in namespace \texttt{std}.
- \texttt{\{ last, B \}} for the overloads in namespace \texttt{ranges}.

Complexity: At most \((last - first) / 2\) swaps.

25.10 Generalized numeric operations

[numeric.ops]

1 [Note: The use of closed ranges as well as semi-open ranges to specify requirements throughout this subclause is intentional. — end note]
25.10.1 Definitions

1 Define \texttt{GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, a_1, \ldots, a_N) as follows:
\begin{enumerate}
\item[(1.1)] \texttt{a_1} when \(N\) is 1, otherwise
\item[(1.2)] \texttt{op(GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, a_1, \ldots, a_K),
\texttt{GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, a_M, \ldots, a_N)) for any \(K\) where \(1 < K + 1 = M \leq N\).
\end{enumerate}

2 Define \texttt{GENERALIZED\_SUM}(op, a_1, \ldots, a_N) as \texttt{GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, b_1, \ldots, b_N),
where \(b_1, \ldots, b_N\) may be any permutation of \(a_1, \ldots, a_N\).

25.10.2 Accumulate

\begin{verbatim}
template<class InputIterator, class T>
constexpr T accumulate(InputIterator first, InputIterator last, T init);
template<class InputIterator, class T, class BinaryOperation>
constexpr T accumulate(InputIterator first, InputIterator last, T init,
BinaryOperation binary_op);
\end{verbatim}

\begin{enumerate}
\item Preconditions: \(T\) meets the \texttt{Cpp17CopyConstructible} (Table 29) and \texttt{Cpp17CopyAssignable} (Table 31) requirements. In the range \([\texttt{first}, \texttt{last}]\), \texttt{binary_op} neither modifies elements nor invalidates iterators or subranges.
\item Effects: Computes its result by initializing the accumulator \(\texttt{acc}\) with the initial value \(\texttt{init}\) and then modifies it with \(\texttt{acc} = \texttt{std}\texttt{::move(acc)} + *i\) or \(\texttt{acc} = \texttt{binary_op(std}\texttt{::move(acc)}, *i)\) for every iterator \(i\) in the range \([\texttt{first}, \texttt{last})\) in order.
\end{enumerate}

25.10.3 Reduce

\begin{verbatim}
template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::value_type
reduce(InputIterator first, InputIterator last);
template<class ExecutionPolicy, class ForwardIterator>
typename iterator_traits<ForwardIterator>::value_type
reduce(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last);
template<class InputIterator, class T>
constexpr T reduce(InputIterator first, InputIterator last, T init);
template<class ExecutionPolicy, class ForwardIterator, class T>
T reduce(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last, T init);
template<class InputIterator, class T, class BinaryOperation>
constexpr T reduce(InputIterator first, InputIterator last, T init,
BinaryOperation binary_op);
\end{verbatim}

\begin{enumerate}
\item Effects: Equivalent to:
\texttt{return reduce(first, last,}
\texttt{typename iterator_traits<InputIterator>::value_type());}
\item Effects: Equivalent to:
\texttt{return reduce(std::forward<ExecutionPolicy>(exec), first, last,}
\texttt{typename iterator_traits<ForwardIterator>::value_type());}
\item Effects: Equivalent to:
\texttt{return reduce(first, last, init, plus<>());}
\item Effects: Equivalent to:
\texttt{return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());}
\end{enumerate}

---

235) The use of fully closed ranges is intentional.
236) \texttt{accumulate} is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
T reduce(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last, T init,
    BinaryOperation binary_op);

Mandates:
All of
(5.1) — binary_op(init, *first),
(5.2) — binary_op(*first, init),
(5.3) — binary_op(init, init), and
(5.4) — binary_op(*first, *first)
are convertible to T.

Preconditions:
(6.1) — T meets the Cpp17MoveConstructible (Table 28) requirements.
(6.2) — binary_op neither invalidates iterators or subranges, nor modifies elements in the range [first, last).

Returns: GENERALIZED_SUM(binary_op, init, *i, ...) for every i in [first, last).

Complexity: O(last - first) applications of binary_op.

[Note: The difference between reduce and accumulate is that reduce applies binary_op in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative binary_op such as floating-point addition. — end note]

25.10.4 Inner product

template<class InputIterator1, class InputIterator2, class T>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2, T init);

Preconditions: T meets the Cpp17CopyConstructible (Table 29) and Cpp17CopyAssignable (Table 31) requirements. In the ranges [first1, last1) and [first2, first2 + (last1 - first1)] binary_op1 and binary_op2 neither modifies elements nor invalidates iterators or subranges.²³⁷

Effects: Computes its result by initializing the accumulator acc with the initial value init and then modifying it with acc = acc + (*i1) * (*i2) or acc = binary_op1(acc, binary_op2(*i1, *i2)) for every iterator i1 in the range [first1, last1) and iterator i2 in the range [first2, first2 + (last1 - first1)) in order.

25.10.5 Transform reduce

template<class InputIterator1, class InputIterator2, class T>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2,
    T init);

Effects: Equivalent to:
return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
T transform_reduce(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2,
Effects: Equivalent to:

```cpp
template<class InputIterator1, class InputIterator2, class T,  
        class BinaryOperation1, class BinaryOperation2>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,  
                             InputIterator2 first2, T init,  
                             BinaryOperation1 binary_op1,  
                             BinaryOperation2 binary_op2);
```

Mandates: All of

- (7.1) `binary_op(init, init)`,
- (7.2) `binary_op(init, unary_op(*first))`,
- (7.3) `binary_op(unary_op(*first), init)`, and
- (7.4) `binary_op(unary_op(*first), unary_op(*first))` are convertible to T.

Preconditions:

- (7.1) T meets the `Cpp17MoveConstructible` (Table 28) requirements.
- (7.2) Neither `binary_op1` nor `binary_op2` invalidates subranges, nor modifies elements in the ranges `[first1, last1]` and `[first2, first2 + (last1 - first1)]`.

Returns:

GENERALIZED_SUM(binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...) for every iterator i in [first1, last1).

Complexity: $\Theta(last1 - first1)$ applications each of `binary_op1` and `binary_op2`.

Mandates: All of

- (7.1) `binary_op(init, init)`,
- (7.2) `binary_op(init, unary_op(*first))`,
- (7.3) `binary_op(unary_op(*first), init)`, and
- (7.4) `binary_op(unary_op(*first), unary_op(*first))` are convertible to T.

Preconditions:
--- T meets the Opp17MoveConstructible (Table 28) requirements.

--- Neither unary_op nor binary_op invalidates subranges, nor modifies elements in the range [first, last].

Returns:
GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)
for every iterator i in [first, last).

Complexity: Θ(last - first) applications each of unary_op and binary_op.

[Note: transform_reduce does not apply unary_op to init. — end note]

25.10.6 Partial sum

```cpp
template<class InputIterator, class OutputIterator>
constexpr OutputIterator partial_sum(InputIterator first, InputIterator last, OutputIterator result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator partial_sum(InputIterator first, InputIterator last, OutputIterator result, BinaryOperation binary_op);
```

Mandates: InputIterator’s value type is constructible from *first. The result of the expression std::move(acc) + *i or binary_op(std::move(acc), *i) is implicitly convertible to InputIterator’s value type. acc is writable (23.3.1) to result.

Preconditions: In the ranges [first, last] and [result, result + (last - first)] binary_op neither modifies elements nor invalidates iterators or subranges.²³⁸

Effects: For a non-empty range, the function creates an accumulator acc whose type is InputIterator’s value type, initializes it with *first, and assigns the result to *result. For every iterator i in [first + 1, last) in order, acc is then modified by acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) and the result is assigned to *(result + (i - first)).

Returns: result + (last - first).

Complexity: Exactly (last - first) - 1 applications of the binary operation.

Remarks: result may be equal to first.

25.10.7 Exclusive scan

```cpp
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator exclusive_scan(InputIterator first, InputIterator last, OutputIterator result, T init);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2 exclusive_scan(ExecutionPolicy&& exec, ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result, T init);

template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
constexpr OutputIterator exclusive_scan(InputIterator first, InputIterator last, OutputIterator result, T init, BinaryOperation binary_op);
```

²³⁸ The use of fully closed ranges is intentional.
template<class ExecutionPolicy,
    class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec,
    ForwardIterator1 first, ForwardIterator1 last,
    ForwardIterator2 result, T init, BinaryOperation binary_op);

Mandates: All of
(3.1) — binary_op(init, init),
(3.2) — binary_op(init, *first), and
(3.3) — binary_op(*first, *first)
are convertible to T.

Preconditions:
(4.1) — T meets the Cpp17MoveConstructible (Table 28) requirements.
(4.2) — binary_op neither invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result, result + (last - first)].

Effects: For each integer K in [0, last - first) assigns through result + K the value of:
GENERALIZED_NONCOMMUTATIVE_SUM
    binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1)

Returns: The end of the resulting range beginning at result.

Complexity: $\mathcal{O}(last - first)$ applications of binary_op.

Remarks: result may be equal to first.

[Note: The difference between exclusive_scan and inclusive_scan is that exclusive_scan excludes the $i$th input element from the $i$th sum. If binary_op is not mathematically associative, the behavior of exclusive_scan may be nondeterministic. — end note]

### 25.10.8 Inclusive scan

(template<i inclusive.scan>

```
template<class InputIterator, class OutputIterator>  
constexpr OutputIterator  
inclusive_scan(InputIterator first, InputIterator last,  
OutputIterator result);
```

Effects: Equivalent to:
```
return inclusive_scan(first, last, result, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>  
ForwardIterator2  
inclusive_scan(ExecutionPolicy&& exec,  
ForwardIterator1 first, ForwardIterator1 last,  
ForwardIterator2 result);
```

Effects: Equivalent to:
```
return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());
```

```
template<class InputIterator, class OutputIterator, class BinaryOperation>  
constexpr OutputIterator  
inclusive_scan(InputIterator first, InputIterator last,  
OutputIterator result, BinaryOperation binary_op);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,  
class BinaryOperation>  
ForwardIterator2  
inclusive_scan(ExecutionPolicy&& exec,  
ForwardIterator1 first, ForwardIterator1 last,  
ForwardIterator2 result, BinaryOperation binary_op);
```
template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
OutputIterator result, BinaryOperation binary_op, T init);

template<class ExecutionPolicy, 
class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec, 
ForwardIterator1 first, ForwardIterator1 last, 
ForwardIterator2 result, BinaryOperation binary_op, T init);

Let U be the value type of decltype(first).

Mandates: If init is provided, all of

(4.1) — binary_op(init, init),
(4.2) — binary_op(init, *first), and
(4.3) — binary_op(*first, *first)

are convertible to T; otherwise, binary_op(*first, *first) is convertible to U.

Preconditions:

(5.1) — If init is provided, T meets the Cpp17MoveConstructible (Table 28) requirements; otherwise, U meets the Cpp17MoveConstructible requirements.
(5.2) — binary_op neither invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result, result + (last - first)].

Effects: For each integer K in [0, last - first) assigns through result + K the value of

(6.1) — GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *(first + 0), *(first + 1), ..., *(first + K))
if init is provided, or
(6.2) — GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, *(first + 0), *(first + 1), ..., *(first + K))
otherwise.

Returns: The end of the resulting range beginning at result.

Complexity: O(last - first) applications of binary_op.

Remarks: result may be equal to first.

[Note: The difference between exclusive_scan and inclusive_scan is that inclusive_scan includes the i\text{th} input element in the i\text{th} sum. If binary_op is not mathematically associative, the behavior of inclusive_scan may be nondeterministic. — end note]
(1.3) binary_op(unary_op(*first), unary_op(*first)) are convertible to T.

Preconditions:

(2.1) T meets the Cpp17MoveConstructible (Table 28) requirements.
(2.2) Neither unary_op nor binary_op invalidates iterators or subranges, nor modifies elements in the ranges [first, last) or [result, result + (last - first)].

Effects: For each integer K in [0, last - first) assigns through result + K the value of:

\[
\text{GENERALIZED_NONCOMMUTATIVE_SUM} \\
\text{binary_op, init,} \\
\text{unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K - 1))}
\]

Returns: The end of the resulting range beginning at result.

Complexity: \(O(last - first)\) applications each of unary_op and binary_op.

Remarks: result may be equal to first.

[Note: The difference between transform_exclusive_scan and transform_inclusive_scan is that transform_exclusive_scan excludes the \(i^{th}\) input element from the \(i^{th}\) sum. If binary_op is not mathematically associative, the behavior of transform_exclusive_scan may be nondeterministic. transform_inclusive_scan does not apply unary_op to init. — end note]

25.10.10 Transform inclusive scan [transform.inclusive.scan]

```
template<class InputIterator, class OutputIterator, 
  class BinaryOperation, class UnaryOperation>
constexpr OutputIterator
transform_inclusive_scan(InputIterator first, InputIterator last, 
  OutputIterator result, 
  BinaryOperation binary_op, UnaryOperation unary_op);
```

```
template<class ExecutionPolicy, 
  class ForwardIterator1, class ForwardIterator2, 
  class BinaryOperation, class UnaryOperation>
ForwardIterator2
transform_inclusive_scan(ExecutionPolicy&& exec, 
  ForwardIterator1 first, ForwardIterator1 last, 
  ForwardIterator2 result, 
  BinaryOperation binary_op, UnaryOperation unary_op);
```

```
template<class InputIterator, class OutputIterator, 
  class BinaryOperation, class UnaryOperation, class T>
constexpr OutputIterator
transform_inclusive_scan(InputIterator first, InputIterator last, 
  OutputIterator result, 
  BinaryOperation binary_op, UnaryOperation unary_op, 
  T init);
```

```
template<class ExecutionPolicy, 
  class ForwardIterator1, class ForwardIterator2, 
  class BinaryOperation, class UnaryOperation, class T>
ForwardIterator2
transform_inclusive_scan(ExecutionPolicy&& exec, 
  ForwardIterator1 first, ForwardIterator1 last, 
  ForwardIterator2 result, 
  BinaryOperation binary_op, UnaryOperation unary_op, 
  T init);
```

Let U be the value type of decltype(first).

Mandates: If init is provided, all of

(2.1) binary_op(init, init),
(2.2) binary_op(init, unary_op(*first)), and
(2.3) binary_op(unary_op(*first), unary_op(*first))
are convertible to T; otherwise, binary_op(unary_op(*first), unary_op(*first)) is convertible to U.

Preconditions:

(3.1) if init is provided, T meets the Cpp17MoveConstructible (Table 28) requirements; otherwise, U meets the Cpp17MoveConstructible requirements.

(3.2) Neither unary_op nor binary_op invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result, result + (last - first)].

Effects: For each integer K in [0, last - first) assigns through result + K the value of

(4.1) GENERALIZED_NONCOMMUTATIVE_SUM

  binary_op, init,
  unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))

if init is provided, or

(4.2) GENERALIZED_NONCOMMUTATIVE_SUM

  binary_op,
  unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))

otherwise.

Returns: The end of the resulting range beginning at result.

Complexity: $\Theta(last - first)$ applications each of unary_op and binary_op.

Remarks: result may be equal to first.

[Note: The difference between transform_exclusive_scan and transform_inclusive_scan is that transform_inclusive_scan includes the $i$th input element in the $i$th sum. If binary_op is not mathematically associative, the behavior of transform_inclusive_scan may be nondeterministic. transform_inclusive_scan does not apply unary_op to init. — end note]

### 25.10.11 Adjacent difference

```cpp
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
adjacent_difference(InputIterator first, InputIterator last,
                    OutputIterator result);  

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
adjacent_difference(InputIterator first, InputIterator last,
                    OutputIterator result, BinaryOperation binary_op);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last,
                    ForwardIterator2 result, BinaryOperation binary_op);
```

Let T be the value type of decltype(first). For the overloads that do not take an argument binary_op, let binary_op be an lvalue that denotes an object of type minus<>.

**Mandates:**

(2.1) For the overloads with no ExecutionPolicy, T is constructible from *first. acc (defined below) is writable (23.3.1) to the result output iterator. The result of the expression binary_op(val, std::move(acc)) is writable to result.

(2.2) For the overloads with an ExecutionPolicy, the result of the expressions binary_op(*first, *first) and *first are writable to result.
Preconditions:

— For the overloads with no `ExecutionPolicy`, `T` meets the `Cpp17MoveAssignable` (Table 30) requirements.

— For all overloads, in the ranges `[first, last]` and `[result, result + (last - first)]`, `binary_op` neither modifies elements nor invalidate iterators or subranges.

Effects: For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an accumulator `acc` of type `T`, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last)` in order, creates an object `val` whose type is `T`, initializes it with `*i`, computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to `acc`.

For the overloads with an `ExecutionPolicy` and a non-empty range, performs `*result = *first`. Then, for every `d` in `[1, last - first - 1]`, performs `*(result + d) = binary_op(*(first + d), *(first + (d - 1)))`.

Returns: `result + (last - first)`.

Complexity: Exacty `(last - first) - 1` applications of the binary operation.

Remarks: For the overloads with no `ExecutionPolicy`, `result` may be equal to `first`. For the overloads with an `ExecutionPolicy`, the ranges `[first, last)` and `[result, result + (last - first)) shall not overlap.

25.10.12 Iota

```cpp
template<class ForwardIterator, class T>
constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

Mandates: `T` is convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has type `T`, is well-formed.

Effects: For each element referred to by the iterator `i` in the range `[first, last)`, assigns `*i = value` and increments `value` as if by `++value`.

Complexity: Exacty last - first increments and assignments.

25.10.13 Greatest common divisor

```cpp
template<class M, class N>
constexpr common_type_t<M, N> gcd(M m, N n);
```

Mandates: `M` and `N` both are integer types and not `cv` bool.

Preconditions: `|m|` and `|n|` are representable as a value of `common_type_t<M, N>`. [Note: These requirements ensure, for example, that `gcd(m, m) = |m|` is representable as a value of type `M`. — end note]

Returns: Zero when `m` and `n` are both zero. Otherwise, returns the greatest common divisor of `|m|` and `|n|`.

Throws: Nothing.

25.10.14 Least common multiple

```cpp
template<class M, class N>
constexpr common_type_t<M, N> lcm(M m, N n);
```

Mandates: `M` and `N` both are integer types and not `cv` bool.

Preconditions: `|m|` and `|n|` are representable as a value of `common_type_t<M, N>`. The least common multiple of `|m|` and `|n|` is representable as a value of type `common_type_t<M, N>.

Returns: Zero when either `m` or `n` is zero. Otherwise, returns the least common multiple of `|m|` and `|n|`.

Throws: Nothing.

239) The use of fully closed ranges is intentional.

§ 25.10.14 © ISO/IEC 2020 – All rights reserved 1133
25.10.15 Midpoint

template<class T>
constexpr T midpoint(T a, T b) noexcept;

1 Constraints: T is an arithmetic type other than bool.
2 Returns: Half the sum of a and b. If T is an integer type and the sum is odd, the result is rounded towards a.
3 Remarks: No overflow occurs. If T is a floating-point type, at most one inexact operation occurs.

template<class T>
constexpr T* midpoint(T* a, T* b);

4 Constraints: T is an object type.
5 Mandates: T is a complete type.
6 Preconditions: a and b point to, respectively, elements i and j of the same array object x. [Note: As specified in 6.8.2, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of n elements is considered to be equivalent to a pointer to a hypothetical array element n for this purpose. —end note]
7 Returns: A pointer to array element \( i + \frac{j-i}{2} \) of x, where the result of the division is truncated towards zero.

25.11 Specialized <memory> algorithms

1 The contents specified in this subclause 25.11 are declared in the header <memory> (20.10.2).
2 Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement new-expression (7.6.2.7) are destroyed in an unspecified order before allowing the exception to propagate.
3 [Note: When invoked on ranges of potentially-overlapping subobjects (6.7.2), the algorithms specified in this subclause 25.11 result in undefined behavior. —end note]
4 Some algorithms specified in this clause make use of the exposition-only function voidify:

   template<class T>
   constexpr void* voidify(T& obj) noexcept {
     return const_cast<void*>(static_cast<const volatile void*>(addressof(obj)));
   }

25.11.1 Special memory concepts

1 Some algorithms in this subclause are constrained with the following exposition-only concepts:

   template<class I>
   concept no-throw-input-iterator = // exposition only
     input_iterator<I> &&
     is_lvalue_reference_v<iter_reference_t<I>> &&
     same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>;

   A type I models no-throw-input-iterator only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.

2 [Note: This concept allows some input_iterator (23.3.4.9) operations to throw exceptions. —end note]
3 template<class S, class I>
   concept no-throw-sentinel = sentinel_for<S, I>; // exposition only

   Types S and I model no-throw-sentinel only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type I and S.

4 [Note: This concept allows some sentinel_for (23.3.4.7) operations to throw exceptions. —end note]
template<class R>
concept no-throw-input-range = // exposition only
  range<R> &&
  no-throw-input-iterator<iterator_t<R>> &&
  no-throw-sentinel<sentinel_t<R>, iterator_t<R>>;

A type R models no-throw-input-range only if no exceptions are thrown from calls to ranges::begin
and ranges::end on an object of type R.

template<class I>
concept no-throw-forward-iterator = // exposition only
  no-throw-input-iterator<I> &&
  forward_iterator<I> &&
  no-throw-sentinel<I, I>;

[Note: This concept allows some forward_iterator (23.3.4.11) operations to throw exceptions. — end
  note]

template<class R>
concept no-throw-forward-range = // exposition only
  no-throw-input-range<R> &&
  no-throw-forward-iterator<iterator_t<R>>;

25.11.2 uninitialized_default_construct [uninitialized.construct.default]

template<class NoThrowForwardIterator>
void uninitialized_default_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);

Effects: Equivalent to:
  for (; first != last; ++first)
    ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type;

namespace ranges {
  template<no-throw-forward-iterator I, no-throw-sentinel<I> S>
  requires default_initializable<iter_value_t<I>>
  I uninitialized_default_construct (I first, S last);
  template<no-throw-forward-range R>
  requires default_initializable<range_value_t<R>>
  borrowed_iterator_t<R> uninitialized_default_construct(R&& r);
}

Effects: Equivalent to:
  for (; first != last; ++first)
    ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
  return first;

template<class NoThrowForwardIterator, class Size>
NoThrowForwardIterator uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);

Effects: Equivalent to:
  for (; n > 0; (void)++first, --n)
    ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type;
  return first;

namespace ranges {
  template<no-throw-forward-iterator I>
  requires default_initializable<iter_value_t<I>>
  I uninitialized_default_constructor_n(I first, iter_difference_t<I> n);
}

Effects: Equivalent to:
  return uninitialized_default_constructor_n(counted_iterator(first, n),
    default_sentinel).base();
25.11.3 uninitialized_value_construct

```cpp
template<class NoThrowForwardIterator>
void uninitialized_value_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

**Effects:**

Equivalent to:

```cpp
for (; first != last; ++first)
    ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type();
```

```cpp
namespace ranges {
    template<no-throw-forward-iterator I, no-throw-sentinel<I> S>
        requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct(I first, S last);

    template<no-throw-forward-range R>
        requires default_initializable<range_value_t<R>>
    borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
}
```

**Effects:**

Equivalent to:

```cpp
for (; first != last; ++first)
    ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>();
return first;
```

```cpp
namespace ranges {
    template<class NoThrowForwardIterator, class Size>
        NoThrowForwardIterator uninitialized_value_construct_n(NoThrowForwardIterator first, Size n);
}
```

**Effects:**

Equivalent to:

```cpp
for (; n > 0; (void)++first, --n)
    ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type();
return first;
```

```cpp
namespace ranges {
    template<no-throw-forward-iterator I>
        requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}
```

**Effects:**

```cpp
return uninitialized_value_construct(counted_iterator(first, n),
    default_sentinel).base();
```

25.11.4 uninitialized_copy

```cpp
template<class InputIterator, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_copy(InputIterator first, InputIterator last,
    NoThrowForwardIterator result);
```

**Preconditions:** result + [0, (last - first)) does not overlap with [first, last).

**Effects:**

Equivalent to:

```cpp
for (; first != last; ++result, (void) ++first)
    ::new (voidify(*result))
    typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

**Returns:** result.

```cpp
namespace ranges {
    template<input_iterator I, sentinel_for<I> S1,
        no-throw-forward-iterator O, no-throw-sentinel<O> S2>
        requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_result<I, O>
    uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
}
```
template<input_range IR, no-throw-forward-range OR>
  requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
  uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
  uninitialized_copy(IR&& in_range, OR&& out_range);
}

Preconditions: [ofirst, olast) does not overlap with [ifirst, ilast).

Effects: Equivalent to:
  for (; ifirst != ilast & & ofirst != olast; ++ofirst, (void)++ifirst) {
    ::new (voidify(*ofirst)) remove_reference_t<iter_reference_t<O>>(*ifirst);
  }
  return {std::move(ifirst), ofirst};

template<class InputIterator, class Size, class NoThrowForwardIterator>
  NoThrowForwardIterator uninitialized_copy_n(InputIterator first, Size n,
  NoThrowForwardIterator result);

Preconditions: result + [0, n) does not overlap with first + [0, n).

Effects: Equivalent to:
  for ( ; n > 0; ++result, (void) ++first, --n) {
    ::new (voidify(*result))
      typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
  }
  return result.

namespace ranges {
  template<input_iterator I, no-throw-forward-iterator O, no-throw-sentinel<O> S>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_n_result<I, O>
    uninitialized_copy_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}

Preconditions: [ofirst, olast) does not overlap with ifirst + [0, n).

Effects: Equivalent to:
  auto t = uninitialized_copy(counted_iterator(ifirst, n),
    default_sentinel, ofirst, olast);
  return {std::move(t.in).base(), t.out};

25.11.5 uninitialized_move
[uninitialized.move]

template<class InputIterator, class NoThrowForwardIterator>
  NoThrowForwardIterator uninitialized_move(InputIterator first, InputIterator last,
  NoThrowForwardIterator result);

Preconditions: result + [0, (last - first)) does not overlap with [first, last).

Effects: Equivalent to:
  for (; first != last; (void)++result, ++first) {
    ::new (voidify(*result))
      typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
  }
  return result;

namespace ranges {
  template<input_iterator I, sentinel_for<I> S1,
    no-throw-forward-iterator O, no-throw-sentinel<O> S2>
    requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
    uninitialized_move_result<I, O>
    uninitialized_move(I ifirst, S1 ilast, O ofirst, S2 olast);
  template<input_range IR, no-throw-forward-range OR>
    requires constructible_from<range_value_t<OR>, range_rvalue_reference_t<IR>>
    uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
    uninitialized_move(IR&& in_range, OR&& out_range);
  }

3 Preconditions: \([\text{ofirst}, \text{olast}) \text{ does not overlap with } [\text{ifirst}, \text{ilast})\].

4 Effects: Equivalent to:

   for (; \text{ofirst} != \text{olast}; ++\text{ofirst}) {
      \text{::new (voidify(*\text{ofirst}))}
      \text{::remove_reference_t<iter_reference_t<O>>(ranges::iter_move(\text{ifirst}))};
   }
   \text{return \{std::move(\text{ifirst}), \text{ofirst}\};}

[Note: If an exception is thrown, some objects in the range \([\text{first}, \text{last})\) are left in a valid, but unspecified state. — end note]

6 template<class InputIterator, class Size, class NoThrowForwardIterator>
   pair<InputIterator, NoThrowForwardIterator>
   uninitialized_move_n(InputIterator \text{first}, Size \text{n}, NoThrowForwardIterator \text{result});

6 Preconditions: \text{result} + [0, \text{n}) \text{ does not overlap with } \text{first} + [0, \text{n})

7 Effects: Equivalent to:

   for (; \text{n} > 0; ++\text{result}, (void) ++\text{first}, --\text{n})
   \text{::new (voidify(*\text{result}))}
   \text{typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*\text{first}))};
   \text{return \{\text{first}, \text{result}\};}

namespace ranges {
   template<input_iterator I, no-throw-forward-iterator O, no-throw-sentinel<O> S>
   requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
   uninitialized_move_n_result<I, O>
   uninitialized_move_n(I \text{ifirst}, iter_difference_t<I> \text{n}, 0 \text{ofirst}, S \text{olast});
}

8 Preconditions: \([\text{ofirst}, \text{olast}) \text{ does not overlap with } \text{ifirst} + [0, \text{n})\].

9 Effects: Equivalent to:

   auto \text{t} = uninitialized_move(counted_iterator(\text{ifirst}, \text{n}),
   default_sentinel, \text{ofirst}, \text{olast});
   \text{return \{std::move(t.in).base(), t.out\};}

[Note: If an exception is thrown, some objects in the range \text{first} + [0, \text{n}) are left in a valid but unspecified state. — end note]

25.11.6 uninitialized_fill

template<class NoThrowForwardIterator, class T>
void uninitialized_fill(NoThrowForwardIterator \text{first}, NoThrowForwardIterator \text{last}, const T& \text{x});

1 Effects: Equivalent to:

   for (; \text{first} != \text{last}; ++\text{first})
   \text{::new (voidify(*\text{first}))}
   \text{typename iterator_traits<NoThrowForwardIterator>::value_type(\text{x});}

namespace ranges {
   template<no-throw-forward-iterator I, no-throw-sentinel<I> S, class T>
   requires constructible_from<iter_value_t<I>, const T&>
   I uninitialized_fill(I \text{first}, S \text{last}, const T& \text{x});
   template<no-throw-forward-range R, class T>
   requires constructible_from<range_value_t<R>, const T&>
   borrowed_iterator_t<R> uninitialized_fill(R&& \text{r}, const T& \text{x});
}

Effects: Equivalent to:

   for (; \text{first} != \text{last}; ++\text{first}) {
      \text{::new (voidify(*\text{first})) remove_reference_t<iter_reference_t<I>>(\text{x});
   }
   \text{return \text{first};}
template<class NoThrowForwardIterator, class Size, class T>
  NoThrowForwardIterator uninitialized_fill_n(NoThrowForwardIterator first, Size n, const T& x);

Effects: Equivalent to:
  
  for (; n--; ++first)
    ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type(x);
  return first;

namespace ranges {
  template<no-throw-forward-iterator I, class T>
  requires constructible_from<iter_value_t<I>, const T&>
  I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
}

Effects: Equivalent to:
  return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();

25.11.7 construct_at

[specialized.construct]

template<class T, class... Args>
  constexpr T* construct_at(T* location, Args&&... args);

namespace ranges {
  template<class T, class... Args>
  constexpr T* construct_at(T* location, Args&&... args);
}

Constraints: The expression ::new (declval<void*>()) T(declval<Args>()...) is well-formed
when treated as an unevaluated operand.

Effects: Equivalent to:
  return ::new (voidify(*location)) T(std::forward<Args>(args)...);

25.11.8 destroy

[specialized.destroy]

template<class T>
  constexpr void destroy_at(T* location);

namespace ranges {
  template<destructible T>
  constexpr void destroy_at(T* location) noexcept;
}

Effects:

(1.1) If T is an array type, equivalent to destroy(begin(*location), end(*location)).

(1.2) Otherwise, equivalent to location->~T().

template<class NoThrowForwardIterator>
  constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);

Effects: Equivalent to:
  for (; first != last; ++first)
    destroy_at(addressof(*first));

namespace ranges {
  template<no-throw-input-iterator I, no-throw-sentinel<I> S>
  requires destructible<iter_value_t<I>>
  constexpr I destroy(I first, S last) noexcept;
  template<no-throw-input-range R>
  requires destructible<range_value_t<R>>
  constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}

Effects: Equivalent to:
  for (; first != last; ++first)
    destroy_at(addressof(*first));
return first;

template<class NoThrowForwardIterator, class Size>
constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);

Effects: Equivalent to:
for (; n > 0; (void)++first, --n)
    destroy_at(addressof(*first));
return first;

namespace ranges {
    template<no-throw-input-iterator I>
    requires destructible<iter_value_t<I>>
    constexpr I destroy_n(I first, iter_difference_t<I> n) noexcept;
}

Effects: Equivalent to:
return destroy(counted_iterator(first, n), default_sentinel).base();

25.12 C library algorithms

[Note: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — end note]

void* bsearch(const void* key, const void* base, size_t nmemb, size_t size, 
c-compare-pred* compar);
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size, 
compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, c-compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);

Effects: These functions have the semantics specified in the C standard library.

Preconditions: The objects in the array pointed to by base are of trivial type.

Throws: Any exception thrown by compar (16.5.5.13).

See also: ISO C 7.22.5.
26 Numerics library

26.1 General

This Clause describes components that C++ programs may use to perform seminumerical operations.

The following subclauses describe components for complex number types, random number generation, numeric (n-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in Table 92.

Table 92: Numerics library summary

<table>
<thead>
<tr>
<th>Subclause</th>

</tr>
<tr>
<td>26.8</td>
<td>Mathematical functions for floating-point types</td>
</tr>
<tr>
<td>26.9</td>
<td>Numbers</td>
</tr>
</tbody>
</table>

26.2 Numeric type requirements

The complex and valarray components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A numeric type is a cv-unqualified object type T that meets the Cpp17DefaultConstructible, Cpp17CopyConstructible, Cpp17CopyAssignable, and Cpp17Destructible requirements (16.5.3.1).

If any operation on T throws an exception the effects are undefined.

In addition, many member and related functions of valarray<T> can be successfully instantiated and will exhibit well-defined behavior if and only if T meets additional requirements specified for each such member or related function.

[Example: It is valid to instantiate valarray<complex>, but operator() will not be successfully instantiated for valarray<complex> operands, since complex does not have any ordering operators. — end example]

26.3 The floating-point environment

26.3.1 Header <cfenv> synopsis

#define FE_ALL_EXCEPT see below
#define FE_DIVBYZERO see below // optional
#define FE_INEXACT see below   // optional
#define FE_INVALID see below   // optional
#define FE_OVERFLOW see below  // optional
#define FE_UNDERFLOW see below // optional
#define FE_DOWNWARD see below  // optional
#define FE_TONEAREST see below // optional
#define FE_TOWARDZERO see below // optional
#define FE_UPWARD see below   // optional
#define FE_DFL_ENV see below

In other words, value types. These include arithmetic types, pointers, the library class complex, and instantiations of valarray for value types.

240) In other words, value types. These include arithmetic types, pointers, the library class complex, and instantiations of valarray for value types.
namespace std {
    // types
    using fenv_t = object type;
    using fexcept_t = integer type;

    // functions
    int feclearexcept(int except);
    int fegetexceptflag(fexcept_t* pflag, int except);
    int feraiseexcept(int except);
    int fesetexceptflag(const fexcept_t* pflag, int except);
    int fetestexcept(int except);
    int fegetround();
    int fesetround(int mode);
    int fegetenv(fenv_t* penv);
    int feholdexcept(fenv_t* penv);
    int fesetenv(const fenv_t* penv);
    int feupdateenv(const fenv_t* penv);
}

1 The contents and meaning of the header `<cfenv>` are the same as the C standard library header `<fenv.h>`. [Note: This document does not require an implementation to support the FENV_ACCESS pragma; it is implementation-defined (15.9) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. —end note]

2 The floating-point environment has thread storage duration (6.7.5.2). The initial state for a thread’s floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding thread object (32.4.2) or jthread object (32.4.3) at the time it constructed the object. [Note: That is, the child thread gets the floating-point state of the parent thread at the time of the child’s creation. —end note]

3 A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

See also: ISO C 7.6

26.4 Complex numbers [complex.numbers]

1 The header `<complex>` defines a class template, and numerous functions for representing and manipulating complex numbers.

2 The effect of instantiating the template complex for any type other than float, double, or long double is unspecified. The specializations complex<float>, complex<double>, and complex<long double> are literal types (6.8).

3 If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

4 If z is an lvalue of type cv complex<T> then:
   
   (4.1) the expression reinterpret_cast<cv T(&)[2]>(z) is well-formed,
   
   (4.2) reinterpret_cast<cv T(&)[2]>(z)[0] designates the real part of z, and
   
   (4.3) reinterpret_cast<cv T(&)[2]>(z)[1] designates the imaginary part of z.

   Moreover, if a is an expression of type cv complex<T>* and the expression a[i] is well-defined for an integer expression i, then:
   
   (4.4) reinterpret_cast<cv T*>(a)[2*i] designates the real part of a[i], and
   
   (4.5) reinterpret_cast<cv T*>(a)[2*i + 1] designates the imaginary part of a[i].

26.4.2 Class template complex

namespace std {
    template<class T> class complex {
        public:
            using value_type = T;

            constexpr complex(const T& re = T(), const T& im = T());
            constexpr complex(const complex&);
            template<class X> constexpr complex(const complex<X>&);

            constexpr T real() const;
            constexpr void real(T);
            constexpr T imag() const;
            constexpr void imag(T);

            constexpr complex& operator= (const T&);
            constexpr complex& operator+=(const T&);
            constexpr complex& operator-=(const T&);
            constexpr complex& operator*=(const T&);
            constexpr complex& operator/=(const T&);
            template<class X> constexpr complex& operator= (const complex<X>&);
            template<class X> constexpr complex& operator+=(const complex<X>&);
            template<class X> constexpr complex& operator-=(const complex<X>&);
            template<class X> constexpr complex& operator*=(const complex<X>&);
            template<class X> constexpr complex& operator/=(const complex<X>&);
    };
}

1 The class complex describes an object that can store the Cartesian components, real() and imag(), of a complex number.

constexpr complex& operator-=(long double);
constexpr complex& operator*=(long double);
constexpr complex& operator/=(long double);
constexpr complex& operator=(const complex&);
template<class X> constexpr complex& operator=(const complex<X>&);
template<class X> constexpr complex& operator+=(const complex<X>&);
template<class X> constexpr complex& operator-=(const complex<X>&);
template<class X> constexpr complex& operator*=(const complex<X>&);
template<class X> constexpr complex& operator/=(const complex<X>&);
};

26.4.4 Member functions

template<class T> constexpr complex(const T& re = T(), const T& im = T());
Postconditions: real() == re && imag() == im is true.
constexpr T real() const;
Returns: The value of the real component.
constexpr void real(T val);
Effects: Assigns val to the real component.
constexpr T imag() const;
Returns: The value of the imaginary component.
constexpr void imag(T val);
Effects: Assigns val to the imaginary component.

26.4.5 Member operators

constexpr complex& operator+=(const T& rhs);
Effects: Adds the scalar value rhs to the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.
Returns: *this.
constexpr complex& operator-=(const T& rhs);
Effects: Subtracts the scalar value rhs from the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.
Returns: *this.
constexpr complex& operator*=(const T& rhs);
Effects: Multiplies the scalar value rhs by the complex value *this and stores the result in *this.
Returns: *this.
constexpr complex& operator/=(const T& rhs);
Effects: Divides the scalar value rhs into the complex value *this and stores the result in *this.
Returns: *this.
template<class X> constexpr complex& operator+=(const complex<X>& rhs);
Effects: Adds the complex value rhs to the complex value *this and stores the sum in *this.
Returns: *this.
template<class X> constexpr complex& operator-=(const complex<X>& rhs);

Effects: Subtracts the complex value \( \text{rhs} \) from the complex value \(*\text{this}\) and stores the difference in \(*\text{this}\).

Returns: \(*\text{this}\).

template<class X> constexpr complex& operator*=(const complex<X>& rhs);

Effects:Multiplies the complex value \( \text{rhs} \) by the complex value \(*\text{this}\) and stores the product in \(*\text{this}\).

Returns: \(*\text{this}\).

template<class X> constexpr complex& operator/=(const complex<X>& rhs);

Effects:Divides the complex value \( \text{rhs} \) into the complex value \(*\text{this}\) and stores the quotient in \(*\text{this}\).

Returns: \(*\text{this}\).

26.4.6 Non-member operations

[complex.ops]

template<class T> constexpr complex<T> operator+(const complex<T>& lhs);

Returns: \text{complex\textunderscore\textquoteleft\textquoteleft T\textquoteleft\textquoteleft(\text{lhs})}.

template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);

Returns: \text{complex\textunderscore\textquoteleft\textquoteleft T\textquoteleft\textquoteleft(\text{lhs} \text{+} \text{rhs})}.

template<class T> constexpr complex<T> operator-(const complex<T>& lhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);

Returns: \text{complex\textunderscore\textquoteleft\textquoteleft T\textquoteleft\textquoteleft(\text{lhs} \text{--} \text{rhs})}.

template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);

Returns: \text{complex\textunderscore\textquoteleft\textquoteleft T\textquoteleft\textquoteleft(\text{lhs} \text{\*} \text{rhs})}.

template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator/(const T& lhs, const complex<T>& rhs);

Returns: \text{complex\textunderscore\textquoteleft\textquoteleft T\textquoteleft\textquoteleft(\text{lhs} \text{\slash} \text{rhs})}.

template<class T, class charT, class traits>

basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);

Preconditions: The input values are convertible to \( T \).

Effects: Extracts a complex number \( x \) of the form: \( u, (u, v) \), where \( u \) is the real part and \( v \) is the imaginary part (29.7.4.2).

If bad input is encountered, calls \text{is.setstate(ios\textunderscore base::failbit)} (which may throw \text{ios\textunderscore base::failure(29.5.5.4)}).

Returns: \text{is}.

Remarks: This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.
template<class T, class charT, class traits>
  basic_ostream<charT, traits>& operator<< (basic_ostream<charT, traits>& o, const complex<T>& x);

  Effects: Inserts the complex number x onto the stream o as if it were implemented as follows:

  basic_ostringstream<charT, traits> s;
  s.flags(o.flags());
  s.imbue(o.getloc());
  s.precision(o.precision());
  s << '(' << x.real() << ',' << x.imag() << ')';
  return o << s.str();

  [Note: In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting showpoint into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously. — end note]

### 26.4.7 Value operations

[complex.value.ops]

template<class T> constexpr T real(const complex<T>& x);

  Returns: x.real().

template<class T> constexpr T imag(const complex<T>& x);

  Returns: x.imag().

template<class T> T abs(const complex<T>& x);

  Returns: The magnitude of x.

template<class T> T arg(const complex<T>& x);

  Returns: The phase angle of x, or atan2(imag(x), real(x)).

template<class T> constexpr T norm(const complex<T>& x);

  Returns: The squared magnitude of x.

template<class T> constexpr complex<T> conj(const complex<T>& x);

  Returns: The complex conjugate of x.

template<class T> complex<T> proj(const complex<T>& x);

  Returns: The projection of x onto the Riemann sphere.

  Remarks: Behaves the same as the C function cproj. See also: ISO C 7.3.9.5

template<class T> complex<T> polar(const T& rho, const T& theta = T());

  Preconditions: rho is non-negative and non-NaN. theta is finite.

  Returns: The complex value corresponding to a complex number whose magnitude is rho and whose phase angle is theta.

### 26.4.8 Transcendentals

[complex.transcendentals]

template<class T> complex<T> acos(const complex<T>& x);

  Returns: The complex arc cosine of x.

  Remarks: Behaves the same as the C function cacos. See also: ISO C 7.3.5.1

template<class T> complex<T> asin(const complex<T>& x);

  Returns: The complex arc sine of x.

  Remarks: Behaves the same as the C function casin. See also: ISO C 7.3.5.2

template<class T> complex<T> atan(const complex<T>& x);

  Returns: The complex arc tangent of x.

  Remarks: Behaves the same as the C function catan. See also: ISO C 7.3.5.3
template<class T> complex<T> acosh(const complex<T>& x);

Returns: The complex arc hyperbolic cosine of x.

Remarks: Behaves the same as the C function cacosh. See also: ISO C 7.3.6.1

template<class T> complex<T> asinh(const complex<T>& x);

Returns: The complex arc hyperbolic sine of x.

Remarks: Behaves the same as the C function casinh. See also: ISO C 7.3.6.2

template<class T> complex<T> atanh(const complex<T>& x);

Returns: The complex arc hyperbolic tangent of x.

Remarks: Behaves the same as the C function catanh. See also: ISO C 7.3.6.3

template<class T> complex<T> cos(const complex<T>& x);

Returns: The complex cosine of x.

template<class T> complex<T> cosh(const complex<T>& x);

Returns: The complex hyperbolic cosine of x.

template<class T> complex<T> exp(const complex<T>& x);

Returns: The complex base-e exponential of x.

template<class T> complex<T> log(const complex<T>& x);

Returns: The complex natural (base-e) logarithm of x. For all x, imag(log(x)) lies in the interval $[-\pi, \pi]$. [Note: The semantics of this function are intended to be the same in C++ as they are for clog in C. —end note]

Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> log10(const complex<T>& x);

Returns: The complex common (base-10) logarithm of x, defined as log(x) / log(10).

Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);
template<class T> complex<T> pow(const complex<T>& x, const T& y);
template<class T> complex<T> pow(const T& x, const complex<T>& y);

Returns: The complex power of base x raised to the y\textsuperscript{th} power, defined as exp(y * log(x)). The value returned for pow(0, 0) is implementation-defined.

Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> sin(const complex<T>& x);

Returns: The complex sine of x.

template<class T> complex<T> sinh(const complex<T>& x);

Returns: The complex hyperbolic sine of x.

template<class T> complex<T> sqrt(const complex<T>& x);

Returns: The complex square root of x, in the range of the right half-plane. [Note: The semantics of this function are intended to be the same in C++ as they are for csqrt in C. —end note]

Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> tan(const complex<T>& x);

Returns: The complex tangent of x.

template<class T> complex<T> tanh(const complex<T>& x);

Returns: The complex hyperbolic tangent of x.
26.4.9 Additional overloads

The following function templates shall have additional overloads:

\[
\begin{align*}
\text{arg} & \quad \text{norm} \\
\text{conj} & \quad \text{proj} \\
\text{imag} & \quad \text{real}
\end{align*}
\]

where \text{norm}, \text{conj}, \text{imag}, and \text{real} are constexpr overloads.

The additional overloads shall be sufficient to ensure:

1. If the argument has type long double, then it is effectively cast to complex<long double>.
2. Otherwise, if the argument has type double or an integer type, then it is effectively cast to complex<double>.
3. Otherwise, if the argument has type float, then it is effectively cast to complex<float>.

Function template \text{pow} shall have additional overloads sufficient to ensure, for a call with at least one argument of type complex<T>:

1. If either argument has type complex<long double> or type long double, then both arguments are effectively cast to complex<long double>.
2. Otherwise, if either argument has type complex<double>, double, or an integer type, then both arguments are effectively cast to complex<double>.
3. Otherwise, if either argument has type complex<float> or float, then both arguments are effectively cast to complex<float>.

26.4.10 Suffixes for complex number literals

This subclause describes literal suffixes for constructing complex number literals. The suffixes i, il, and if create complex numbers of the types complex<double>, complex<long double>, and complex<float> respectively, with their imaginary part denoted by the given literal number and the real part being zero.

\[
\begin{align*}
\text{constexpr complex<long double> operator"il(long double d);} & \quad \text{returns: complex<long double>{0.0L, static_cast<long double>(d)}.} \\
\text{constexpr complex<long double> operator"il(unsigned long long d);} & \quad \text{returns: complex<long double>{0.0L, static_cast<long double>(d)}.}
\end{align*}
\]

\[
\begin{align*}
\text{constexpr complex<double> operator"i(long double d);} & \quad \text{returns: complex<double>{0.0, static_cast<double>(d)}.} \\
\text{constexpr complex<double> operator"i(unsigned long long d);} & \quad \text{returns: complex<double>{0.0, static_cast<double>(d)}.}
\end{align*}
\]

\[
\begin{align*}
\text{constexpr complex<float> operator"if(long double d);} & \quad \text{returns: complex<float>{0.0f, static_cast<float>(d)}.} \\
\text{constexpr complex<float> operator"if(unsigned long long d);} & \quad \text{returns: complex<float>{0.0f, static_cast<float>(d)}.}
\end{align*}
\]

26.5 Bit manipulation

26.5.1 General

The header <bit> provides components to access, manipulate and process both individual bits and bit sequences.

26.5.2 Header <bit> synopsis

\[
\begin{align*}
\text{namespace std { } & \quad \text{[bit.syn]} \\
\text{\ \\} & \quad \text{[bit]}
\end{align*}
\]

§ 26.5.2 ©ISO/IEC 2020 – All rights reserved 1150
template<class T>
constexpr T bit_width(T x) noexcept;

// 26.5.5, rotating
template<class T>
[[nodiscard]] constexpr T rotl(T x, int s) noexcept;
template<class T>
[[nodiscard]] constexpr T rotr(T x, int s) noexcept;

// 26.5.6, counting
template<class T>
constexpr int countl_zero(T x) noexcept;
template<class T>
constexpr int countl_one(T x) noexcept;
template<class T>
constexpr int countr_zero(T x) noexcept;
template<class T>
constexpr int countr_one(T x) noexcept;
template<class T>
constexpr int popcount(T x) noexcept;

// 26.5.7, endian
enum class endian {
  little = see below,
  big = see below,
  native = see below
};

26.5.3 Function template bit_cast

template<class To, class From>
constexpr To bit_cast(const From& from) noexcept;

Constraints:
(1.1) sizeof(To) == sizeof(From) is true;
(1.2) is_trivially_copyable_v<To> is true; and
(1.3) is_trivially_copyable_v<From> is true.

Returns: An object of type To. Implicitly creates objects nested within the result (6.7.2). Each bit of the value representation of the result is equal to the corresponding bit in the object representation of from. Padding bits of the result are unspecified. For the result and each object created within it, if there is no value of the object's type corresponding to the value representation produced, the behavior is undefined. If there are multiple such values, which value is produced is unspecified.

Remarks: This function is constexpr if and only if To, From, and the types of all subobjects of To and From are types T such that:
(3.1) is_union_v<T> is false;
(3.2) is_pointer_v<T> is false;
(3.3) is_member_pointer_v<T> is false;
(3.4) is_volatile_v<T> is false; and
(3.5) T has no non-static data members of reference type.

26.5.4 Integral powers of 2

template<class T>
constexpr bool has_single_bit(T x) noexcept;

Constraints: T is an unsigned integer type (6.8.1).

Returns: true if x is an integral power of two; false otherwise.
template<class T>
constexpr T bit_ceil(T x);

Let $N$ be the smallest power of 2 greater than or equal to $x$.

Constraints: $T$ is an unsigned integer type (6.8.1).

Preconditions: $N$ is representable as a value of type $T$.

Returns: $N$.

Throws: Nothing.

Remarks: A function call expression that violates the precondition in the Preconditions: element is not a core constant expression (7.7).

template<class T>
constexpr T bit_floor(T x) noexcept;

Constraints: $T$ is an unsigned integer type (6.8.1).

Returns: If $x == 0$, 0; otherwise the maximal value $y$ such that has_single_bit($y$) is true and $y <= x$.

template<class T>
constexpr T bit_width(T x) noexcept;

Constraints: $T$ is an unsigned integer type (6.8.1).

Returns: If $x == 0$, 0; otherwise one plus the base-2 logarithm of $x$, with any fractional part discarded.

26.5.5 Rotating

In the following descriptions, let $N$ denote numeric_limits<$T$>::digits.

template<class T>
[[nodiscard]] constexpr T rotl(T x, int s) noexcept;

Constraints: $T$ is an unsigned integer type (6.8.1).

Let $r$ be $s \% N$.

Returns: If $r$ is 0, $x$; if $r$ is positive, ($x << r$ | ($x >> (N - r)$)); if $r$ is negative, rotr($x$, $-r$).

template<class T>
[[nodiscard]] constexpr T rotr(T x, int s) noexcept;

Constraints: $T$ is an unsigned integer type (6.8.1).

Let $r$ be $s \% N$.

Returns: If $r$ is 0, $x$; if $r$ is positive, ($x >> r$) | ($x << (N - r)$)); if $r$ is negative, rotl($x$, $-r$).

26.5.6 Counting

In the following descriptions, let $N$ denote numeric_limits<$T$>::digits.

template<class T>
constexpr int countl_zero(T x) noexcept;

Constraints: $T$ is an unsigned integer type (6.8.1).

Returns: The number of consecutive 0 bits in the value of $x$, starting from the most significant bit.

[Note: Returns $N$ if $x == 0$. — end note]

template<class T>
constexpr int countl_one(T x) noexcept;

Constraints: $T$ is an unsigned integer type (6.8.1).

Returns: The number of consecutive 1 bits in the value of $x$, starting from the most significant bit.

[Note: Returns $N$ if $x ==$ numeric_limits<$T$>::max(). — end note]

template<class T>
constexpr int countr_zero(T x) noexcept;

Constraints: $T$ is an unsigned integer type (6.8.1).
Returns: The number of consecutive 0 bits in the value of x, starting from the least significant bit.
[Note: Returns N if x == 0. — end note]

```cpp
template<class T>
constexpr int countr_one(T x) noexcept;
```

Constraints: T is an unsigned integer type (6.8.1).

Returns: The number of consecutive 1 bits in the value of x, starting from the least significant bit.
[Note: Returns N if x == numeric_limits<T>::max(). — end note]

```cpp
template<class T>
constexpr int popcount(T x) noexcept;
```

Constraints: T is an unsigned integer type (6.8.1).

Returns: The number of 1 bits in the value of x.

### 26.5.7 Endian

Two common methods of byte ordering in multibyte scalar types are big-endian and little-endian in the execution environment. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage of binary data in which the least significant byte is placed first, with the rest in ascending order. This subclause describes the endianness of the scalar types of the execution environment.

```cpp
enum class endian {
    little = see below,
    big = see below,
    native = see below
};
```

If all scalar types have size 1 byte, then all of `endian::little`, `endian::big`, and `endian::native` have the same value. Otherwise, `endian::little` is not equal to `endian::big`. If all scalar types are big-endian, `endian::native` is equal to `endian::big`. If all scalar types are little-endian, `endian::native` is equal to `endian::little`. Otherwise, `endian::native` is not equal to either `endian::big` or `endian::little`.

### 26.6 Random number generation

This subclause defines a facility for generating (pseudo-)random numbers.

In addition to a few utilities, four categories of entities are described: uniform random bit generators, random number engines, random number engine adaptors, and random number distributions. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated. [Note: These entities are specified in such a way as to permit the binding of any uniform random bit generator object e as the argument to any random number distribution object d, thus producing a zero-argument function object such as given by `bind(d,e)`. — end note]

Each of the entities specified via this subclause has an associated arithmetic type (6.8.1) identified as `result_type`. With T as the `result_type` thus associated with such an entity, that entity is characterized:

- as `boolean` or equivalently as `boolean-valued`, if T is `bool`;

- otherwise as `integral` or equivalently as `integer-valued`, if `numeric_limits<T>::is_integer` is `true`;

- otherwise as `floating-point` or equivalently as `real-valued`.

If integer-valued, an entity may optionally be further characterized as `signed` or `unsigned`, according to `numeric_limits<T>::is_signed`.

Unless otherwise specified, all descriptions of calculations in this subclause use mathematical real numbers.

Throughout this subclause, the operators `bitand`, `bitor`, and `xor` denote the respective conventional bitwise operations. Further:

- the operator `rshift` denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and

- the operator `lshift` denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo $2^w$.
26.6.1 Header `<random>` synopsis

```cpp
#include <initializer_list>

namespace std {
    // 26.6.2.3, uniform random bit generator requirements
    template<class G>
    concept uniform_random_bit_generator = see below;

ISO/IEC JTC1 SC22 WG21 N4860

26.6.2 Requirements

26.6.2.1 General requirements

Throughout this subclause 26.6, the effect of instantiating a template:

1. that has a template type parameter named `Sseq` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of seed sequence (26.6.2.2).

2. that has a template type parameter named `URBG` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of uniform random bit generator (26.6.2.3).

3. that has a template type parameter named `Engine` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of random number engine (26.6.2.4).

4. that has a template type parameter named `RealType` is undefined unless the corresponding template argument is cv-unqualified and is one of `float`, `double`, or `long double`.

5. that has a template type parameter named `IntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `short`, `int`, `long`, `long long`, `unsigned short`, `unsigned`, `int`, `unsigned long`, or `unsigned long long`.

6. that has a template type parameter named `UIntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.

Throughout this subclause 26.6, phrases of the form “x is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “x is a value of a type meeting the requirements of the specified iterator type”.

Throughout this subclause 26.6, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared `explicit`.

26.6.2.2 Seed sequence requirements

A seed sequence is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values \(i\), \(0 \leq i < 2^{32}\), based on the consumed data. [Note: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. — end note]

A class `S` meets the requirements of a seed sequence if the expressions shown in Table 93 are valid and have the indicated semantics, and if `S` also meets all other requirements of this subclause 26.6.2.2. In that Table and throughout this subclause:

1. `T` is the type named by `S`'s associated `result_type`;
2. `q` is a value of `S` and `r` is a possibly const value of `S`;
3. `ib` and `ie` are input iterators with an unsigned integer `value_type` of at least 32 bits;
4. `rb` and `re` are mutable random access iterators with an unsigned integer `value_type` of at least 32 bits;
5. `ob` is an output iterator; and
6. `il` is a value of `initializer_list<T>`.

### 26.6.2.3 Uniform random bit generator requirements

A uniform random bit generator \(g\) of type \(G\) is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned. [Note: The degree to which \(g\)’s results approximate the ideal is often determined statistically. — end note]

```cpp
template<class G>
concept uniform_random_bit_generator =
    invocable<\&\& G> & & unsigned_integral<invoke_result_t<G&>> & &
    requires {
        { G::min() } -> same_as<invoke_result_t<G&>>;
        { G::max() } -> same_as<invoke_result_t<G&>>;
        requires bool_constant<(G::min() < G::max())>::value;
    };
```

Let \(g\) be an object of type \(G\). \(G\) models `uniform_random_bit_generator` only if

1. \(g() \leq G::max()\), and
2. \(g() \leq G::max()\), and
3. \(g()\) has amortized constant complexity.

A class \(G\) meets the uniform random bit generator requirements if \(G\) models `uniform_random_bit_generator`, `invoke_result_t<G&>` is an unsigned integer type (6.8.1), and \(G\) provides a nested `typedef-name result_type` that denotes the same type as `invoke_result_t<G&>`.
26.6.2.4 Random number engine requirements

A random number engine (commonly shortened to engine) e of type E is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.

At any given time, e has a state e_i for some integer i ≥ 0. Upon construction, e has an initial state e_0. An engine’s state may be established via a constructor, a seed function, assignment, or a suitable operator>>.

E’s specification shall define:

1. The size of E’s state in multiples of the size of result_type, given as an integral constant expression;
2. The transition algorithm TA by which e’s state e_i is advanced to its successor state e_i+1; and
3. The generation algorithm GA by which an engine’s state is mapped to a value of type result_type.

A class E that meets the requirements of a uniform random bit generator (26.6.2.3) also meets the requirements of a random number engine if the expressions shown in Table 94 are valid and have the indicated semantics, and if E also meets all other requirements of this subclause 26.6.2.4.

<td>Advances e’s state e_i to e_i+z by any means equivalent to e().</td>
<td>no worse than the complexity of z consecutive calls e()</td>
</tr>
</tbody>
</table>

241) This constructor (as well as the subsequent corresponding seed() function) may be particularly useful to applications requiring a large number of independent random sequences.

242) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes z consecutive calls e().

Postconditions: The ( \text{is}.\text{fmtflags} ) are unchanged.</td>
<td>( \mathcal{O}(\text{size of state}) )</td>
</tr>
</tbody>
</table>

---

5 E shall meet the *Cpp17CopyConstructible* (Table 29) and *Cpp17CopyAssignable* (Table 31) requirements. These operations shall each be of complexity no worse than \( \mathcal{O}(\text{size of state}) \).

26.6.2.5 Random number engine adaptor requirements

A *random number engine adaptor* (commonly shortened to *adaptor*) \( a \) of type \( \mathcal{A} \) is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine \( b \) of type \( \mathcal{B} \) adapted in this way is termed a *base engine* in this context. The expression \( a.\text{base}() \) shall be valid and shall return a const reference to \( a \)'s base engine.
The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

A::A();

Effects: The base engine is initialized as if by its default constructor.

bool operator==(const A& a1, const A& a2);

Returns: true if a1's base engine is equal to a2's base engine. Otherwise returns false.

A::A(result_type s);

Effects: The base engine is initialized with s.

template<class Sseq> A::A(Sseq& q);

Effects: The base engine is initialized with q.

void seed();

Effects: With b as the base engine, invokes b.seed().

void seed(result_type s);

Effects: With b as the base engine, invokes b.seed(s).

template<class Sseq> void seed(Sseq& q);

Effects: With b as the base engine, invokes b.seed(q).

A shall also meet the following additional requirements:

(10.1) The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.

(10.2) The state of A shall include the state of its base engine. The size of A's state shall be no less than the size of the base engine.

(10.3) Copying A's state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of A.

(10.4) The textual representation of A shall include the textual representation of its base engine.

26.6.2.6 Random number distribution requirements [rand.req.dist]

A random number distribution (commonly shortened to distribution) d of type D is a function object returning values that are distributed according to an associated mathematical probability density function p(z) or according to an associated discrete probability function P(z_i). A distribution's specification identifies its associated probability function p(z) or P(z_i).

An associated probability function is typically expressed using certain externally-supplied quantities known as the parameters of the distribution. Such distribution parameters are identified in this context by writing, for example, p(z | a, b) or P(z_i | a, b), to name specific parameters, or by writing, for example, p(z | {p}) or P(z_i | {p}), to denote a distribution's parameters p taken as a whole.

A class D meets the requirements of a random number distribution if the expressions shown in Table 95 are valid and have the indicated semantics, and if D and its associated types also meet all other requirements of this subclause 26.6.2.6. In that Table and throughout this subclause,

(3.1) T is the type named by D's associated result_type;

(3.2) P is the type named by D's associated param_type;

(3.3) d is a value of D, and x and y are (possibly const) values of D;

(3.4) glb and lub are values of T respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by d's operator(), as determined by the current values of d's parameters;

(3.5) p is a (possibly const) value of P;

(3.6) g, g1, and g2 are lvalues of a type meeting the requirements of a uniform random bit generator (26.6.2.3);

(3.7) os is an lvalue of the type of some class template specialization basic_ostream<charT, traits>; and
— is is an lvalue of the type of some class template specialization basic_istream<
charT, traits>; where charT and traits are constrained according to Clause 21 and
Clause 29.

<td></td>
</tr>
</tbody>
</table>

4. `D` shall meet the `Cpp17CopyConstructible` (Table 29) and `Cpp17CopyAssignable` (Table 31) requirements.
5. The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of `D` between any of the invocations `d(g)`.
6. If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.
7. It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In this subclause 26.6, declarations of `D::param_type` are in the form of `typedefs` for convenience of exposition only.
8. `P` shall meet the `Cpp17CopyConstructible` (Table 29), `Cpp17CopyAssignable` (Table 31), and `Cpp17Equality-Comparable` (Table 25) requirements.
9. For each of the constructors of `D` taking arguments corresponding to parameters of the distribution, `P` shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of `D` that return values corresponding to parameters of the distribution, `P` shall have a corresponding member function with the identical name, type, and semantics.
10. `P` shall have a declaration of the form
    
    ```
    using distribution_type = D;
    ```

26.6.3 Random number engine class templates

1. Each type instantiated from a class template specified in this subclause 26.6.3 meets the requirements of a random number engine (26.6.2.4) type.
2. Except where specified otherwise, the complexity of each function specified in this subclause 26.6.3 is constant.
3. Except where specified otherwise, no function described in this subclause 26.6.3 throws an exception.
4. Every function described in this subclause 26.6.3 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.
5. Descriptions are provided in this subclause 26.6.3 only for engine operations that are not described in 26.6.2.4 or for operations where there is additional semantic information. In particular, declarations for
copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6 Each template specified in this subclause 26.6.3 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

7 For every random number engine and for every random number engine adaptor X defined in this subclause (26.6.3) and in subclause 26.6.4:

(7.1) — if the constructor

\[
\text{template<class Sseq> explicit X(Sseq& q)}; \\
\]

is called with a type Sseq that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

(7.2) — if the member function

\[
\text{template<class Sseq> void seed(Sseq& q)}; \\
\]

is called with a type Sseq that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to X::result_type.

26.6.3.1 Class template linear_congruential_engine

1 A linear_congruential_engine random number engine produces unsigned integer random numbers. The state \(x_i\) of a linear_congruential_engine object \(x\) is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form \(TA(x_i) = (a \cdot x_i + c) \mod m\); the generation algorithm is \(GA(x_i) = x_i + 1\).

\[
\text{template<class UIntType, UIntType a, UIntType c, UIntType m> class linear_congruential_engine { \\
public: \\
using result_type = UIntType; \\
// engine characteristics \\
static constexpr result_type multiplier = a; \\
static constexpr result_type increment = c; \\
static constexpr result_type modulus = m; \\
static constexpr result_type min() { return c == 0u ? 1u: 0u; } \\
static constexpr result_type max() { return m - 1u; } \\
static constexpr result_type default_seed = 1u; \\
// constructors and seeding functions \\
linear_congruential_engine() : linear_congruential_engine(default_seed) {} \\
explicit linear_congruential_engine(result_type s); \\
template<class Sseq> explicit linear_congruential_engine(Sseq& q); \\
void seed(result_type s = default_seed); \\
template<class Sseq> void seed(Sseq& q); \\
// generating functions \\
result_type operator()(); \\
void discard(unsigned long long z); 
}; \\
\]

2 If the template parameter \(m\) is 0, the modulus \(m\) used throughout this subclause 26.6.3.1 is \texttt{numeric_limits<result_type>::max()} plus 1. [Note: \(m\) need not be representable as a value of type \texttt{result_type}. –end note]

3 If the template parameter \(m\) is not 0, the following relations shall hold: \(a < m\) and \(c < m\).

4 The textual representation consists of the value of \(x_i\).
explicit linear_congruential_engine(result_type s);

Effects: If \( c \mod m = 0 \) and \( s \mod m = 0 \), sets the engine’s state to 1, otherwise sets the engine’s state to \( s \mod m \).

template<
class Sseq

effect: Linear congruential_engine

Effects: With \( k = \left\lceil \frac{\log_2 m}{32} \right\rceil \) and \( a \) an array (or equivalent) of length \( k + 3 \), invokes \( q \), generate \( (a + 0, a + k + 3) \) and then computes \( S = (\sum_{j=0}^{k-1} a_{j+3} \cdot 2^{2j}) \mod m \). If \( c \mod m = 0 \) and \( S = 0 \), sets the engine’s state to 1, else sets the engine’s state to \( S \).

26.6.3.2 Class template mersenne_twister_engine

A mersenne_twister_engine random number engine\(^{243}\) produces unsigned integer random numbers in the closed interval \([0, 2^w - 1]\). The state \( x \) of a mersenne_twister_engine object \( x \) is of size \( n \) and consists of a sequence \( X \) of \( n \) values of the type delivered by \( x \); all subscripts applied to \( X \) are to be taken modulo \( n \).

The transition algorithm employs a twisted generalized feedback shift register defined by shift values \( n \) and \( m \), a twist value \( a \), and a conditional xor-mask \( b \). To improve the uniformity of the result, the bits of the raw shift register are additionally tempered (i.e., scrambled) according to a bit-scrambling matrix defined by values \( u, d, s, b, c, t, \) and \( \ell \).

The state transition is performed as follows:

\[ (2.1) \quad \text{Concatenate the upper } w - r \text{ bits of } X_{i-n} \text{ with the lower } r \text{ bits of } X_{i+1-n} \text{ to obtain an unsigned integer value } Y. \]

\[ (2.2) \quad \text{With } \alpha = a \cdot (Y \text{ bitand } 1), \text{ set } X_i \text{ to } X_{i+m-n} \text{ xor } (Y \text{ rshift } 1) \text{ xor } \alpha. \]

The sequence \( X \) is initialized with the help of an initialization multiplier \( f \).

The generation algorithm determines the unsigned integer values \( z_1, z_2, z_3, z_4 \) as follows, then delivers \( z_4 \) as its result:

\[ (3.1) \quad \text{Let } z_1 = X_i \text{ xor } ((X_i \text{ rshift } u) \text{ bitand } d). \]

\[ (3.2) \quad \text{Let } z_2 = z_1 \text{ xor } ((z_1 \text{ lshift } w) \text{ bitand } b). \]

\[ (3.3) \quad \text{Let } z_3 = z_2 \text{ xor } ((z_2 \text{ lshift } t) \text{ bitand } c). \]

\[ (3.4) \quad \text{Let } z_4 = z_3 \text{ xor } (z_3 \text{ rshift } \ell). \]

---

\(^{243}\) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.
The generation algorithm is given by

\[
\begin{align*}
\text{The state transition is performed as follows:} \\
\text{Effects: Sets } X_{-n} \text{ to value mod } 2^w. \text{ Then, iteratively for } i = 1 - n, \ldots, -1, \text{ sets } X_i \text{ to } \\
[f \cdot (X_{-1} \text{ xor } (X_{-1} \text{ rshift } (w - 2))) + i \text{ mod } n] \text{ mod } 2^w. \\
\text{Complexity: } O(n). \\
\end{align*}
\]

The textual representation of \( x_i \) consists of the values of \( X_{i-n}, \ldots, X_{i-1} \), in that order.

\[
\begin{align*}
\text{Effects: With } k = \lceil w/32 \rceil \text{ and } a \text{ an array (or equivalent) of length } n \cdot k, \text{ invokes } q.\text{generate}(a + 0, a + n \cdot k) \text{ and then, iteratively for } i = -n, \ldots, -1, \text{ sets } X_i \text{ to } \\
\left(\sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j}\right) \text{ mod } 2^w. \text{ Finally, if the most significant } w - r \text{ bits of } X_{-n} \text{ are zero, and if each of the other resulting } X_i \text{ is 0, changes } X_{-n} \text{ to } 2^{w-1}. \\
\end{align*}
\]

### 26.6.3.3 Class template subtract_with_carry_engine

A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.

The state \( x_i \) of a `subtract_with_carry_engine` object \( x \) is of size \( O(r) \), and consists of a sequence \( X \) of \( r \) integer values \( 0 \leq X_i < m = 2^w \); all subscripts applied to \( X \) are to be taken modulo \( r \). The state \( x_i \) additionally consists of an integer \( c \) (known as the `carry`) whose value is either 0 or 1.

The state transition is performed as follows:

\[
\begin{align*}
\text{(1.1) } & \quad \text{Let } Y = X_{i-s} - X_{i-r} - c. \\
\text{(1.2) } & \quad \text{Set } X_i \text{ to } y = Y \mod m. \text{ Set } c \text{ to 1 if } Y < 0, \text{ otherwise set } c \text{ to 0.} \\
\text{[Note: This algorithm corresponds to a modular linear function of the form } T_A(x_i) = (a \cdot x_i) \mod b, \text{ where } b \text{ is of the form } m^r - m^s + 1 \text{ and } a = b - (b - 1)/m. \text{ — end note]} \\
\end{align*}
\]

The generation algorithm is given by \( \text{GA}(x_i) = y \), where \( y \) is the value produced as a result of advancing the engine’s state as described above.

```cpp
template<class UIntType, size_t w, size_t s, size_t r>
class subtract_with_carry_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t short_lag = s;
    static constexpr size_t long_lag = r;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return m - 1; }
    static constexpr result_type default_seed = 19780503u;

    // constructors and seeding functions
    mersenne_twister_engine() : mersenne_twister_engine(default_seed) {} 
    explicit mersenne_twister_engine(result_type value); 
    template<class Sseq> explicit mersenne_twister_engine(Sseq& q); 
    void seed(result_type value = default_seed); 
    template<class Sseq> void seed(Sseq& q); 

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);
};
```
// constructors and seeding functions
subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {}
explicit subtract_with_carry_engine(result_type value);
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
void seed(result_type value = default_seed);
template<class Sseq> void seed(Sseq& q);

// generating functions
result_type operator()();
void discard(unsigned long long z);

The following relations shall hold: 0u < s, s < r, 0 < w, and w <= numeric_limits<UIntType>::digits.
The textual representation consists of the values of $X_{i-r}, \ldots, X_{i-1}$, in that order, followed by c.

explicit subtract_with_carry_engine(result_type value);
Effects: Sets the values of $X_{i-r}, \ldots, X_{i-1}$, in that order, as specified below. If $X_{i-1}$ is then 0, sets c to 1; otherwise sets c to 0.
To set the values $X_k$, first construct e, a linear_congruential_engine object, as if by the following definition:

```
linear_congruential_engine<result_type,
  40014u,0u,2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each $X_k$, obtain new values $z_0, \ldots, z_{n-1}$ from $n = \lceil w/32 \rceil$ successive invocations of e taken modulo $2^{32}$. Set $X_k$ to $\sum_{j=0}^{n-1} a_j \cdot (i+j) \cdot 2^{32})$ mod m. If $X_{i-1}$ is then 0, sets c to 1; otherwise sets c to 0.

Complexity: Exactly $n \cdot r$ invocations of e.

template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
Effects: With k = $\lceil w/32 \rceil$ and a an array (or equivalent) of length $r \cdot k$, invokes q.generate($a + 0$, $a + r \cdot k$) and then, iteratively for $i = -r, \ldots, -1$, sets $X_i$ to $\sum_{j=0}^{k-1} a_k \cdot (i+rj) \cdot 2^{32})$ mod m. If $X_{i-1}$ is then 0, sets c to 1; otherwise sets c to 0.

26.6.4 Random number engine adaptor class templates

26.6.4.1 In general
Each type instantiated from a class template specified in this subclause 26.6.4 meets the requirements of a random number engine adaptor (26.6.2.5) type.

2 Except where specified otherwise, the complexity of each function specified in this subclause 26.6.4 is constant.

3 Except where specified otherwise, no function described in this subclause 26.6.4 throws an exception.

4 Every function described in this subclause 26.6.4 that has a function parameter q of type Sseq& for a template type parameter named Sseq that is different from type seed_seq throws what and when the invocation of q.generate throws.

5 Descriptions are provided in this subclause 26.6.4 only for adaptor operations that are not described in subclause 26.6.2.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6 Each template specified in this subclause 26.6.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

26.6.4.2 Class template discard_block_engine
A discard_block_engine random number engine adaptor produces random numbers selected from those produced by some base engine e. The state $x_i$ of a discard_block_engine engine adaptor object x consists of the state $e_i$ of its base engine e and an additional integer n. The size of the state is the size of e’s state plus 1.
The transition algorithm discards all but \( r > 0 \) values from each block of \( p \geq r \) values delivered by \( e \). The state transition is performed as follows: If \( n \geq r \), advance the state of \( e \) from \( e_i \) to \( e_{i+p-r} \) and set \( n \) to 0. In any case, then increment \( n \) and advance \( e \)'s then-current state \( e_j \) to \( e_{j+1} \).

The generation algorithm yields the value returned by the last invocation of \( e() \) while advancing \( e \)'s state as described above.

```cpp
template<class Engine, size_t p, size_t r>
class discard_block_engine {
public:
  // types
  using result_type = typename Engine::result_type;

  // engine characteristics
  static constexpr size_t block_size = p;
  static constexpr size_t used_block = r;
  static constexpr result_type min() { return Engine::min(); }
  static constexpr result_type max() { return Engine::max(); }

  // constructors and seeding functions
  discard_block_engine();
  explicit discard_block_engine(const Engine& e);
  explicit discard_block_engine(Engine&& e);
  explicit discard_block_engine(result_type s);
  template<class Sseq> explicit discard_block_engine(Sseq& q);
  void seed();
  void seed(result_type s);
  template<class Sseq> void seed(Sseq& q);

  // generating functions
  result_type operator();
  void discard(unsigned long long z);

  // property functions
  const Engine& base() const noexcept { return e; }
private:
  Engine e; // exposition only
  int n; // exposition only
};
```

The following relations shall hold: \( 0 < r \) and \( r \leq p \).

The textual representation consists of the textual representation of \( e \) followed by the value of \( n \).

In addition to its behavior pursuant to subclause 26.6.2.5, each constructor that is not a copy constructor sets \( n \) to 0.

### 26.6.4.3 Class template independent_bits_engine

An `independent_bits_engine` random number engine adaptor combines random numbers that are produced by some base engine \( e \), so as to produce random numbers with a specified number of bits \( w \). The state \( x_i \) of an `independent_bits_engine` engine adaptor object \( x \) consists of the state \( e_i \) of its base engine \( e \); the size of the state is the size of \( e \)'s state.

The transition and generation algorithms are described in terms of the following integral constants:

1. \( R = e_{\text{max}} - e_{\text{min}} + 1 \) and \( m = \lceil \log_2 R \rceil \).
2. With \( n \) as determined below, let \( w_0 = \lfloor w/n \rfloor \), \( n_0 = n - w \mod n \), \( y_0 = 2^{w_0} \lceil R/2^{w_0} \rceil \), and \( y_1 = 2^{w_0+1} \lceil R/2^{w_0+1} \rceil \).
3. Let \( n = \lceil w/m \rceil \) if and only if the relation \( R - y_0 \leq \lfloor y_0/n \rfloor \) holds as a result. Otherwise let \( n = 1 + \lceil w/m \rceil \).

\[ \text{Note: The relation } w = n_0 w_0 + (n - n_0)(w_0 + 1) \text{ always holds. } \]

The transition algorithm is carried out by invoking \( e() \) as often as needed to obtain \( n_0 \) values less than \( y_0 + e_{\text{min}} \) and \( n - n_0 \) values less than \( y_1 + e_{\text{min}} \).
The generation algorithm uses the values produced while advancing the state as described above to yield a quantity \( S \) obtained as if by the following algorithm:

\[
S = 0; \\
\text{for } (k = 0; k \neq n_0; k += 1) \{ \\
\quad \text{do } u = e() - e\text{.min}(); \text{ while } (u \geq y_0); \\
\quad S = 2^{w_0} \cdot S + u \mod 2^{w_0}; \\
\} \\
\text{for } (k = n_0; k \neq n; k += 1) \{ \\
\quad \text{do } u = e() - e\text{.min}(); \text{ while } (u \geq y_1); \\
\quad S = 2^{w_0+1} \cdot S + u \mod 2^{w_0+1}; \\
\}
\]

```cpp
template<class Engine, size_t w, class UIntType>
class independent_bits_engine {
    public:
        // types
        using result_type = UIntType;

        // engine characteristics
        static constexpr result_type min() { return 0; }
        static constexpr result_type max() { return 2^w - 1; }

        // constructors and seeding functions
        independent_bits_engine();
        explicit independent_bits_engine(const Engine& e);
        explicit independent_bits_engine(Engine&& e);
        explicit independent_bits_engine(result_type s);
        template<class Sseq> explicit independent_bits_engine(Sseq& q);
        void seed();
        void seed(result_type s);
        template<class Sseq> void seed(Sseq& q);

        // generating functions
        result_type operator()();
        void discard(unsigned long long z);

        // property functions
        const Engine& base() const noexcept { return e; };

    private:
        Engine e; // exposition only
};
```

The following relations shall hold: \( 0 < w \) and \( w \leq \text{numeric\_limits<result\_type>::digits} \).

The textual representation consists of the textual representation of \( e \).

### 26.6.4.4 Class template shuffle_order_engine

A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine \( e \), but delivers them in a different sequence. The state \( x_i \) of a `shuffle_order_engine` engine adaptor object \( x \) consists of the state \( e_i \) of its base engine \( e \), an additional value \( Y \) of the type delivered by \( e \), and an additional sequence \( V \) of \( k \) values also of the type delivered by \( e \). The size of \( x \) is the size of \( e \)'s state plus \( k + 1 \).

The transition algorithm permutes the values produced by \( e \). The state transition is performed as follows:

1. Calculate an integer \( j = \left\lfloor \frac{k(Y - e_{\text{min}})}{e_{\text{max}} - e_{\text{min}} + 1} \right\rfloor \).
2. Set \( Y \) to \( V_j \) and then set \( V_j \) to \( e() \).

The generation algorithm yields the last value of \( Y \) produced while advancing \( e \)'s state as described above.
// engine characteristics
static constexpr size_t table_size = k;
static constexpr result_type min() { return Engine::min(); }
static constexpr result_type max() { return Engine::max(); }

// constructors and seeding functions
shuffle_order_engine();
explicit shuffle_order_engine(const Engine& e);
explicit shuffle_order_engine(Engine&& e);
explicit shuffle_order_engine(result_type s);
template<class Sseq> explicit shuffle_order_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; };

private:
Engine e;       // exposition only
result_type V[k]; // exposition only
result_type Y;  // exposition only

The following relation shall hold: 0 < k.
The textual representation consists of the textual representation of e, followed by the k values of V, followed by the value of Y.
In addition to its behavior pursuant to subclause 26.6.2.5, each constructor that is not a copy constructor initializes V[0],...,V[k-1] and Y, in that order, with values returned by successive invocations of e().

26.6.5 Engines and engine adaptors with predefined parameters [rand.predef]

using minstd_rand0 =
linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type minstd-_rand0 produces the value 1043618065.

using minstd_rand =
linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type minstd-_rand produces the value 399268537.

using mt19937 =
mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
0x9908'b0df, 11, 0xffff'ffff'ffff, 7, 0x9d2c'5680, 15, 0xefc6'0000, 18, 1'812'433'253>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type mt19937 produces the value 412365995.

using mt19937_64 =
mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
0xb502'6f5a'a966'19e9, 29, 0x5555'5555'5555'5555, 17,
0x71d6'7fff'eeda'0000, 37, 0xff7'ee0'0000'0000, 43, 6'364'136'223'846'793'005>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type mt19937_64 produces the value 9981545732273789042.
using ranlux24_base =
  subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;

5 Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux24_base produces the value 7937952.

using ranlux48_base =
  subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;

6 Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux48_base produces the value 61839128582725.

using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;

7 Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux24 produces the value 9901578.

using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;

8 Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux48 produces the value 249142670248501.

using knuth_b = shuffle_order_engine<minstd_rand0,256>;

9 Required behavior: The 10000th consecutive invocation of a default-constructed object of type knuth_b produces the value 1112339016.

using default_random_engine = implementation-defined;

10 Remarks: The choice of engine type named by this typedef is implementation-defined. [Note: The implementation may select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations may select different underlying engine types, code that uses this typedef need not generate identical sequences across implementations. —end note]

26.6.6 Class random_device

A random_device uniform random bit generator produces nondeterministic random numbers.

If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

class random_device {
  public:
    // types
    using result_type = unsigned int;

    // generator characteristics
    static constexpr result_type min() { return numeric_limits<result_type>::min(); }
    static constexpr result_type max() { return numeric_limits<result_type>::max(); }

    // constructors
    random_device() : random_device(implementation-defined) {}
    explicit random_device(const string& token);

    // generating functions
    result_type operator()();

    // property functions
    double entropy() const noexcept;

    // no copy functions
    random_device(const random_device&) = delete;
    void operator=(const random_device&) = delete;
};
explicit random_device(const string& token);

Remarks: The semantics of the token parameter and the token value used by the default constructor are implementation-defined.

Throws: A value of an implementation-defined type derived from exception if the random_device could not be initialized.

double entropy() const noexcept;

Returns: If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate for the random numbers returned by operator(), in the range \(\min()\) to \(\log(\max() + 1)\).

result_type operator()();

Returns: A nondeterministic random value, uniformly distributed between \(\min()\) and \(\max()\) (inclusive). It is implementation-defined how these values are generated.

Throws: A value of an implementation-defined type derived from exception if a random number could not be obtained.

26.6.7 Utilities

26.6.7.1 Class seed_seq

class seed_seq {
public:
   // types
   using result_type = uint_least32_t;

   // constructors
   seed_seq();
   template<class T>
   seed_seq(initializer_list<T> il);
   template<class InputIterator>
   seed_seq(InputIterator begin, InputIterator end);

   // generating functions
   template<class RandomAccessIterator>
   void generate(RandomAccessIterator begin, RandomAccessIterator end);

   // property functions
   size_t size() const noexcept;
   template<class OutputIterator>
   void param(OutputIterator dest) const;

   // no copy functions
   seed_seq(const seed_seq&) = delete;
   void operator=(const seed_seq&) = delete;

private:
   vector<result_type> v;       // exposition only
};

Postconditions: v.empty() is true.

Throws: Nothing.

template<class T>
seed_seq(initializer_list<T> il);

Mandates: T is an integer type.

Effects: Same as seed_seq(il.begin(), il.end()).

244) The parameter is intended to allow an implementation to differentiate between different sources of randomness.

245) If a device has \(n\) states whose respective probabilities are \(P_0, \ldots, P_{n-1}\), the device entropy \(S\) is defined as

\[
S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i.
\]
template<class InputIterator>
seed_seq(InputIterator begin, InputIterator end);

Mandates: iterator_traits<InputIterator>::value_type is an integer type.

Preconditions: InputIterator meets the Cpp17InputIterator requirements (23.3.5.2).

Effects: Initializes v by the following algorithm:
for (InputIterator s = begin; s != end; ++s)
v.push_back(((s)mod232);

template<class RandomAccessIterator>
void generate(RandomAccessIterator begin, RandomAccessIterator end);

Mandates: iterator_traits<RandomAccessIterator>::value_type is an unsigned integer type capable of accommodating 32-bit quantities.

Preconditions: RandomAccessIterator meets the Cpp17RandomAccessIterator requirements (23.3.5.6) and the requirements of a mutable iterator.

Effects: Does nothing if begin == end. Otherwise, with s = v.size() and n = end - begin, fills the supplied range [begin,end) according to the following algorithm in which each operation is to be carried out modulo 2^32, each indexing operator applied to begin is to be taken modulo n, and T(x) is defined as x xor (x rshift 27):

(10.1) — By way of initialization, set each element of the range to the value 0x8b8b8b8b. Additionally, for use in subsequent steps, let p = (n - t)/2 and let q = p + t, where
t = (n ≥ 623) ? 11 : (n ≥ 68) ? 7 : (n ≥ 39) ? 5 : (n ≥ 7) ? 3 : (n - 1)/2;

(10.2) — With m as the larger of s + 1 and n, transform the elements of the range: iteratively for k = 0,...,m - 1, calculate values
\[
\begin{align*}
  r_1 &= 1664525 \cdot T(begin[k] \ xor \ begin[k+p] \ xor \ begin[k-1]) \\
  r_2 &= r_1 + \left\{ \begin{array}{ll}
  s, & k = 0 \\
  k \ mod \ n + v[k-1], & 0 < k \leq s \\
  k \ mod \ n, & s < k
  \end{array} \right.
\end{align*}
\]
and, in order, increment begin[k + p] by r1, increment begin[k + q] by r2, and set begin[k] to r2.

(10.3) — Transform the elements of the range again, beginning where the previous step ended: iteratively for k = m,...,m + n - 1, calculate values
\[
\begin{align*}
  r_3 &= 1566083941 \cdot T(begin[k] + begin[k+p] + begin[k-1]) \\
  r_4 &= r_3 - (k \ mod \ n)
\end{align*}
\]
and, in order, update begin[k + p] by xoring it with r3, update begin[k + q] by xoring it with r4, and set begin[k] to r4.

Throws: What and when RandomAccessIterator operations of begin and end throw.

size_t size() const noexcept;

Returns: The number of 32-bit units that would be returned by a call to param().

Complexity: Constant time.

template<class OutputIterator>
void param(OutputIterator dest) const;

Mandates: Values of type result_type are writable (23.3.1) to dest.

Preconditions: OutputIterator meets the Cpp17OutputIterator requirements (23.3.5.3).

Effects: Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:
copy(v.begin(), v.end(), dest);

Throws: What and when OutputIterator operations of dest throw.
26.6.7.2 Function template generate_canonical

```cpp
template<class RealType, size_t bits, class URBG>
RealType generate_canonical(URBG& g);
```

1. **Complexity:** Exactly \( k = \max(1, \lceil b/\log_2 R \rceil) \) invocations of \( g \), where \( b \) is the lesser of \text{numeric\_limits<RealType>::digits} \text{and} \text{bits}, \text{and} \( R \) is the value of \( g\text{.max()} - g\text{.min()} + 1 \).

2. **Effects:** Invokes \( g() \) \( k \) times to obtain values \( g_0, \ldots, g_{k-1} \), respectively. Calculates a quantity

   \[
   S = \sum_{i=0}^{k-1} (g_i - g\text{.min()} \cdot R^i
   \]

   using arithmetic of type \text{RealType}.

3. **Returns:** \( S/R^k \). [Note: \( 0 \leq S/R^k < 1 \). — end note]

4. **Throws:** What and when \( g \) throws.

5. [Note: If the values \( g_i \) produced by \( g \) are uniformly distributed, the instantiation’s results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution. — end note]

26.6.8 Random number distribution class templates

26.6.8.1 In general

1. Each type instantiated from a class template specified in this subclause 26.6.8 meets the requirements of a random number distribution (26.6.2.6) type.

2. Descriptions are provided in this subclause 26.6.8 only for distribution operations that are not described in 26.6.2.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

3. The algorithms for producing each of the specified distributions are implementation-defined.

4. The value of each probability density function \( p(z) \) and of each discrete probability function \( P(z_i) \) specified in this subclause is 0 everywhere outside its stated domain.

26.6.8.2 Uniform distributions

26.6.8.2.1 Class template uniform_int_distribution

1. A \text{uniform\_int\_distribution} random number distribution produces random integers \( i, a \leq i \leq b \), distributed according to the constant discrete probability function

   \[
   P(i \mid a, b) = 1/(b - a + 1) .
   \]

```cpp
template<class IntType = int>
class uniform_int_distribution {
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructors and reset functions
    uniform_int_distribution() : uniform_int_distribution(0) {}
    explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
    explicit uniform_int_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

246) \( b \) is introduced to avoid any attempt to produce more bits of randomness than can be held in \text{RealType}.}
// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());

2 Preconditions: \( a \leq b \).

3 Remarks: \( a \) and \( b \) correspond to the respective parameters of the distribution.

result_type a() const;

4 Returns: The value of the \( a \) parameter with which the object was constructed.

result_type b() const;

5 Returns: The value of the \( b \) parameter with which the object was constructed.

26.6.8.2.2 Class template uniform_real_distribution

A uniform_real_distribution random number distribution produces random numbers \( x, a \leq x < b \), distributed according to the constant probability density function

\[
p(x \mid a,b) = \frac{1}{(b-a)}.
\]

[Note: This implies that \( p(x \mid a,b) \) is undefined when \( a == b \). — end note]

template<class RealType = double>
class uniform_real_distribution {
public:
// types
using result_type = RealType;
using param_type = unspecified;

// constructors and reset functions
uniform_real_distribution() : uniform_real_distribution(0.0) {} 
explicit uniform_real_distribution(RealType a, RealType b = 1.0);
explicit uniform_real_distribution(const param_type& parm);
void reset();

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit uniform_real_distribution(RealType a, RealType b = 1.0);

2 Preconditions: \( a \leq b \) and \( b - a \leq \text{numeric\_limits}\langle\text{RealType}\rangle\::\text{max}() \).

3 Remarks: \( a \) and \( b \) correspond to the respective parameters of the distribution.

result_type a() const;

4 Returns: The value of the \( a \) parameter with which the object was constructed.
result_type b() const;

Returns: The value of the b parameter with which the object was constructed.

26.6.8.3 Bernoulli distributions
[rand.dist.bern]

26.6.8.3.1 Class bernoulli_distribution
[rand.dist.bern.bernoulli]

A bernoulli_distribution random number distribution produces bool values b distributed according to the discrete probability function

\[ P(b|p) = \begin{cases} p & \text{if } b = \text{true}, \\
1 - p & \text{if } b = \text{false}. \end{cases} \]

```cpp
class bernoulli_distribution {
public:
    // types
    using result_type = bool;
    using param_type = unspecified;

    // constructors and reset functions
    bernoulli_distribution() : bernoulli_distribution(0.5) {}
    explicit bernoulli_distribution(double p);
    explicit bernoulli_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

explicit bernoulli_distribution(double p);

Preconditions: \(0 \leq p \leq 1\).

Remarks: \(p\) corresponds to the parameter of the distribution.

double p() const;

Returns: The value of the p parameter with which the object was constructed.

26.6.8.3.2 Class template binomial_distribution
[rand.dist.bern.bin]

A binomial_distribution random number distribution produces integer values \(i \geq 0\) distributed according to the discrete probability function

\[ P(i|t,p) = \binom{t}{i} \cdot p^i \cdot (1 - p)^{t-i}. \]

```cpp
template<class IntType = int>
class binomial_distribution {
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;
```
ISO/IEC JTC1 SC22 WG21 N4860

// constructors and reset functions
binomial_distribution() : binomial_distribution(1) {}
explicit binomial_distribution(IntType t, double p = 0.5);
explicit binomial_distribution(const param_type& parm);
void reset();

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
IntType t() const;
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

explicit binomial_distribution(IntType t, double p = 0.5);

Preconditions: 0 ≤ p ≤ 1 and 0 ≤ t.
Remarks: t and p correspond to the respective parameters of the distribution.

IntType t() const;
Returns: The value of the t parameter with which the object was constructed.

double p() const;
Returns: The value of the p parameter with which the object was constructed.

26.6.8.3.3 Class template geometric_distribution

A geometric_distribution random number distribution produces integer values i ≥ 0 distributed according to the discrete probability function

\[ P(i \mid p) = p \cdot (1 - p)^i \]

template<class IntType = int>
class geometric_distribution {
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructors and reset functions
    geometric_distribution() : geometric_distribution(0.5) {}
    explicit geometric_distribution(double p);
    explicit geometric_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
explicit geometric_distribution(double p);

Preconditions: $0 < p < 1$.
Remarks: $p$ corresponds to the parameter of the distribution.

double p() const;

Returns: The value of the $p$ parameter with which the object was constructed.

26.6.8.3.4 Class template negative_binomial_distribution

A negative_binomial_distribution random number distribution produces random integers $i \geq 0$ distributed according to the discrete probability function

$$P(i \mid k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i.$$ 

[Note: This implies that $P(i \mid k, p)$ is undefined when $p == 1$. — end note]

template<class IntType = int>
class negative_binomial_distribution {
public:

// types
using result_type = IntType;
using param_type = unspecified;

// constructor and reset functions
explicit negative_binomial_distribution() : negative_binomial_distribution(1) {} 
explicit negative_binomial_distribution(IntType k, double p = 0.5);
explicit negative_binomial_distribution(const param_type& parm);
void reset();

// generating functions
template<class URBG>
result_type operator()(URBG& g);

// property functions
IntType k() const;
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit negative_binomial_distribution(IntType k, double p = 0.5);

Preconditions: $0 < p \leq 1$ and $0 < k$.
Remarks: $k$ and $p$ correspond to the respective parameters of the distribution.

IntType k() const;

Returns: The value of the $k$ parameter with which the object was constructed.

double p() const;

Returns: The value of the $p$ parameter with which the object was constructed.

26.6.8.4 Poisson distributions

26.6.8.4.1 Class template poisson_distribution

A poisson_distribution random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function

$$P(i \mid \mu) = \frac{e^{-\mu} \mu^i}{i!}.$$ 

The distribution parameter $\mu$ is also known as this distribution’s mean.
template<class IntType = int>
class poisson_distribution
{
  public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructors and reset functions
    poisson_distribution() : poisson_distribution(1.0) {}
    explicit poisson_distribution(double mean);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double mean() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

explicit poisson_distribution(double mean);

2 Preconditions: $0 < \text{mean}$.
3 Remarks: mean corresponds to the parameter of the distribution.

double mean() const;
4 Returns: The value of the mean parameter with which the object was constructed.

26.6.8.4.2 Class template exponential_distribution

An exponential_distribution random number distribution produces random numbers $x > 0$ distributed
according to the probability density function

$$p(x | \lambda) = \lambda e^{-\lambda x}.$$
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
);

explicit exponential_distribution(RealType lambda);

Preconditions: $0 < \lambda$.

Remarks: \lambda corresponds to the parameter of the distribution.

RealType lambda() const;

Returns: The value of the \lambda parameter with which the object was constructed.

26.6.8.4.3 Class template gamma_distribution

A gamma_distribution random number distribution produces random numbers $x > 0$ distributed according to the probability density function

\[
p(x|\alpha,\beta) = \frac{e^{-x/\beta}}{\beta^\alpha \cdot \Gamma(\alpha)} \cdot x^{\alpha-1}.
\]

template<class RealType = double>
class gamma_distribution {
public:

    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructors and reset functions
    gamma_distribution() : gamma_distribution(1.0) {}
    explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
    explicit gamma_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType alpha() const;
    RealType beta() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

explicit gamma_distribution(RealType alpha, RealType beta = 1.0);

Preconditions: $0 < \alpha$ and $0 < \beta$.

Remarks: \alpha and \beta correspond to the parameters of the distribution.

RealType alpha() const;

Returns: The value of the \alpha parameter with which the object was constructed.

RealType beta() const;

Returns: The value of the \beta parameter with which the object was constructed.
26.6.8.4.4 Class template `weibull_distribution`

A `weibull_distribution` random number distribution produces random numbers \( x \geq 0 \) distributed according to the probability density function

\[
p(x \mid a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp \left(-\left(\frac{x}{b}\right)^a\right).
\]

```cpp
template<class RealType = double>
class weibull_distribution {
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructor and reset functions
    weibull_distribution() : weibull_distribution(1.0) {}
    explicit weibull_distribution(RealType a, RealType b = 1.0);
    explicit weibull_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

explicit `weibull_distribution`(RealType a, RealType b = 1.0);

- **Preconditions:** \( 0 < a \) and \( 0 < b \).
- **Remarks:** \( a \) and \( b \) correspond to the respective parameters of the distribution.

- **Returns:** The value of the \( a \) parameter with which the object was constructed.

- **Returns:** The value of the \( b \) parameter with which the object was constructed.

26.6.8.4.5 Class template `extreme_value_distribution`

An `extreme_value_distribution` random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x \mid a, b) = \frac{1}{b} \cdot \exp \left(\frac{a - x}{b} - \exp\left(\frac{a - x}{b}\right)\right).
\]

```cpp
template<class RealType = double>
class extreme_value_distribution {
    // types
    using result_type = RealType;
    using param_type = unspecified;
};
```

- **Remarks:** The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

247]
// constructor and reset functions
extreme_value_distribution() : extreme_value_distribution(0.0) {}
explicit extreme_value_distribution(RealType a, RealType b = 1.0);
explicit extreme_value_distribution(const param_type& parm);
void reset();

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
RealType a() const;
RealType b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

explicit extreme_value_distribution(RealType a, RealType b = 1.0);

Preconditions: 0 < b.
Remarks: a and b correspond to the respective parameters of the distribution.

RealType a() const;
Returns: The value of the a parameter with which the object was constructed.

RealType b() const;
Returns: The value of the b parameter with which the object was constructed.

26.6.8.5 Normal distributions
26.6.8.5.1 Class template normal_distribution

A normal_distribution random number distribution produces random numbers $x$ distributed according to the probability density function

$$p(x \mid \mu, \sigma) = \frac{1}{\sigma \sqrt{2\pi}} \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right).$$

The distribution parameters $\mu$ and $\sigma$ are also known as this distribution’s mean and standard deviation.

```cpp
template<class RealType = double>
class normal_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructors and reset functions
    normal_distribution() : normal_distribution(0.0) {}
    explicit normal_distribution(RealType mean, RealType stddev = 1.0);
    explicit normal_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType mean() const;
    RealType stddev() const;
};
```
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit normal_distribution(RealType mean, RealType stddev = 1.0);

Preconditions: 0 < stddev.
Remarks: mean and stddev correspond to the respective parameters of the distribution.

RealType mean() const;
Returns: The value of the mean parameter with which the object was constructed.

RealType stddev() const;
Returns: The value of the stddev parameter with which the object was constructed.

26.6.8.5.2 Class template lognormal_distribution [rand.dist.norm.lognormal]
A lognormal_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x \mid m, s) = \frac{1}{sx\sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right).
\]

template<class RealType = double>
class lognormal_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructor and reset functions
    lognormal_distribution() : lognormal_distribution(0.0) {};
    explicit lognormal_distribution(RealType m, RealType s = 1.0);
    explicit lognormal_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType m() const;
    RealType s() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

explicit lognormal_distribution(RealType m, RealType s = 1.0);

Preconditions: 0 < s.
Remarks: \( m \) and \( s \) correspond to the respective parameters of the distribution.

RealType m() const;
Returns: The value of the \( m \) parameter with which the object was constructed.

RealType s() const;
Returns: The value of the \( s \) parameter with which the object was constructed.
26.6.8.5.3 Class template chi_squared_distribution

A chi_squared_distribution random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x \mid n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}}.$$ 

\[\text{template<class RealType = double>}
\text{class chi_squared_distribution} { 
\text{public:}
\text{using result_type = RealType;}
\text{using param_type = unspecified;}

\text{chi_squared_distribution}() : chi_squared_distribution(1.0) {} 
\text{explicit chi_squared_distribution(RealType n);} 
\text{explicit chi_squared_distribution(const param_type& parm);} 
\text{void reset();}

\text{template<class URBG>}
\text{result_type operator() (URBG& g);} 
\text{template<class URBG>}
\text{result_type operator() (URBG& g, const param_type& parm);} 

\text{RealType n() const;}
\text{param_type param() const;}
\text{void param(const param_type& parm);} 
\text{result_type min() const;}
\text{result_type max() const;}
\text{};}

\[\text{explicit chi_squared_distribution(RealType n);}\]

Preconditions: $0 < n.$

Remarks: $n$ corresponds to the parameter of the distribution.

\[\text{RealType n() const;}
\]

Returns: The value of the $n$ parameter with which the object was constructed.

26.6.8.5.4 Class template cauchy_distribution

A cauchy_distribution random number distribution produces random numbers $x$ distributed according to the probability density function

$$p(x \mid a, b) = \left( \pi b \left( 1 + \left( \frac{x - a}{b} \right)^2 \right) \right)^{-1}.$$ 

\[\text{template<class RealType = double>}
\text{class cauchy_distribution} { 
\text{public:}
\text{using result_type = RealType;}
\text{using param_type = unspecified;}

\text{cauchy_distribution}() : cauchy_distribution(0.0) {} 
\text{explicit cauchy_distribution(RealType a, RealType b = 1.0);} 
\text{explicit cauchy_distribution(const param_type& parm);} 
\text{void reset();} \]
// generating functions
template<class URBG>
    result_type operator()(URBG& g);
template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

// property functions
RealType a() const;
RealType b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

explicit cauchy_distribution(RealType a, RealType b = 1.0);

Preconditions: 0 < b.

Remarks: a and b correspond to the respective parameters of the distribution.

RealType a() const;
Returns: The value of the a parameter with which the object was constructed.

RealType b() const;
Returns: The value of the b parameter with which the object was constructed.

26.6.8.5.5 Class template fisher_f_distribution

A fisher_f_distribution random number distribution produces random numbers \( x \geq 0 \) distributed according to the probability density function

\[
p(x | m, n) = \frac{\Gamma((m + n)/2)}{\Gamma(m/2) \Gamma(n/2)} \cdot \left( \frac{m}{n} \right)^{m/2} \cdot x^{(m/2)-1} \cdot \left( 1 + \frac{m x}{n} \right)^{-(m+n)/2}.
\]

template<class RealType = double>
    class fisher_f_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        fisher_f_distribution() : fisher_f_distribution(1.0) {};
        explicit fisher_f_distribution(RealType m, RealType n = 1.0);
        explicit fisher_f_distribution(const param_type& parm);
        void reset();

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType m() const;
        RealType n() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;
    };

    explicit fisher_f_distribution(RealType m, RealType n = 1);

Preconditions: 0 < m and 0 < n.
Remarks: \( m \) and \( n \) correspond to the respective parameters of the distribution.

\[
\text{RealType } m() \ \text{const};
\]

Returns: The value of the \( m \) parameter with which the object was constructed.

\[
\text{RealType } n() \ \text{const};
\]

Returns: The value of the \( n \) parameter with which the object was constructed.

26.6.8.5.6 Class template student_t_distribution

A \texttt{student_t_distribution} random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x | n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}.
\]

\[
\text{template<class RealType = double>}
\]

\[
\text{class student_t_distribution}
\]

\[
\ \{\ 
\text{public:}
\]

\[
\text{// types}
\]

\[
\text{using result_type = RealType;}
\]

\[
\text{using param_type = unspecified;}
\]

\[
\text{// constructor and reset functions}
\]

\[
\text{student_t_distribution() : student_t_distribution(1.0) {}}
\]

\[
\text{explicit student_t_distribution(RealType n);}
\]

\[
\text{explicit student_t_distribution(const param_type& parm);}
\]

\[
\text{void reset();}
\]

\[
\text{// generating functions}
\]

\[
\text{template<class URBG>}
\]

\[
\text{result_type operator() (URBG& g);}
\]

\[
\text{template<class URBG>}
\]

\[
\text{result_type operator() (URBG& g, const param_type& parm);}
\]

\[
\text{// property functions}
\]

\[
\text{RealType n() const;}
\]

\[
\text{param_type param() const;}
\]

\[
\text{void param(const param_type& parm);}
\]

\[
\text{result_type min() const;}
\]

\[
\text{result_type max() const;}
\]

\}

\[
\text{explicit student_t_distribution(RealType n);}
\]

Preconditions: \( 0 < n \).

Remarks: \( n \) corresponds to the parameter of the distribution.

\[
\text{RealType n() const;}
\]

Returns: The value of the \( n \) parameter with which the object was constructed.

26.6.8.6 Sampling distributions

26.6.8.6.1 Class template discrete_distribution

A \texttt{discrete_distribution} random number distribution produces random integers \( i, 0 \leq i < n \), distributed according to the discrete probability function

\[
P(i | p_0, \ldots, p_{n-1}) = p_i.
\]

Unless specified otherwise, the distribution parameters are calculated as: \( p_k = w_k / S \) for \( k = 0, \ldots, n - 1 \), in which the values \( w_k \), commonly known as the \textit{weights}, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \( 0 < S = w_0 + \cdots + w_{n-1} \).
template<class IntType = int>
class discrete_distribution {
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructor and reset functions
    discrete_distribution();
    template<class InputIterator>
    discrete_distribution(InputIterator firstW, InputIterator lastW);
    discrete_distribution(initializer_list<double> wl);
    template<class UnaryOperation>
    discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
    explicit discrete_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    vector<double> probabilities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

Effects: Constructs a discrete_distribution object with \( n = 1 \) and \( p_0 = 1 \). [Note: Such an object will always deliver the value 0. —end note]

template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);

Mandates: is_convertible_v<iterator_traits<InputIterator>::value_type, double> is true.

Preconditions: InputIterator meets the Cpp17InputIterator requirements (23.3.5.2). If firstW ==
lastW, let \( n = 1 \) and \( w_0 = 1 \). Otherwise, \( [\text{firstW}, \text{lastW}) \) forms a sequence \( w \) of length \( n > 0 \).

Effects: Constructs a discrete_distribution object with probabilities given by the formula above.

discrete_distribution(initializer_list<double> wl);

Effects: Same as discrete_distribution(wl.begin(), wl.end()).

template<class UnaryOperation>
 discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);

Mandates: is_invocable_r_v<double, UnaryOperation&_, double> is true.

Preconditions: If \( nw = 0 \), let \( n = 1 \), otherwise let \( n = nw \). The relation \( 0 < \delta = (xmax - xmin) / n \) holds.

Effects: Constructs a discrete_distribution object with probabilities given by the formula above,
using the following values: If \( nw = 0 \), let \( w_0 = 1 \). Otherwise, let \( w_k = fw(xmin + k \cdot \delta + \delta / 2) \) for
\( k = 0, \ldots, n - 1 \).

Complexity: The number of invocations of \( fw \) does not exceed \( n \).

vector<double> probabilities() const;

Returns: A vector<double> whose size member returns \( n \) and whose operator[] member returns \( p_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n - 1 \).
26.6.8.6.2 Class template `piecewise_constant_distribution`  

A `piecewise_constant_distribution` random number distribution produces random numbers \( x, b_0 \leq x < b_n \), uniformly distributed over each subinterval \([b_i, b_{i+1})\) according to the probability density function

\[
p(x | b_0, \ldots, b_n, \rho_0, \ldots, \rho_{n-1}) = \rho_i, \text{ for } b_i \leq x < b_{i+1}.
\]

The \( n + 1 \) distribution parameters \( b_i \), also known as this distribution's interval boundaries, shall satisfy the relation \( b_i < b_{i+1} \) for \( i = 0, \ldots, n - 1 \). Unless specified otherwise, the remaining \( n \) distribution parameters are calculated as:

\[
\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \ldots, n - 1,
\]

in which the values \( w_k \), commonly known as the weights, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \( 0 < S = w_0 + \cdots + w_{n-1} \).

```cpp
template<class RealType = double>
class piecewise_constant_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructor and reset functions
    piecewise_constant_distribution();
    template<class InputIteratorB, class InputIteratorW>
    piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                      InputIteratorW firstW);
    template<class UnaryOperation>
    piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
    piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
                                     UnaryOperation fw);
    explicit piecewise_constant_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    vector<result_type> intervals() const;
    vector<result_type> densities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

Effects: Constructs a `piecewise_constant_distribution` object with \( n = 1, \rho_0 = 1, b_0 = 0, \) and \( b_1 = 1 \).

```cpp
template<class InputIteratorB, class InputIteratorW>
piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                 InputIteratorW firstW);
```

Mandates: Both of

(4.1) \hspace{1cm} is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>

(4.2) \hspace{1cm} is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>
ISO/IEC JTC1 SC22 WG21 N4860

5 Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements (23.3.5.2). If firstB == lastB or ++firstB == lastB, let n = 1, w_0 = 1, b_0 = 0, and b_1 = 1. Otherwise, [firstB,lastB] forms a sequence b of length n + 1, the length of the sequence w starting from firstW is at least n, and any w_k for k ≥ n are ignored by the distribution.

6 Effects: Constructs a piecewise_constant_distribution object with parameters as specified above.

template<class UnaryOperation>
piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);

7 Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

8 Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: If bl.size() < 2, let n = 1, w_0 = 1, b_0 = 0, and b_1 = 1. Otherwise, let [bl.begin(),bl.end()] form a sequence b_0,…,b_n, and let w_k = fw((b_{k+1}+b_k)/2) for k = 0,…,n-1.

9 Complexity: The number of invocations of fw does not exceed n.

template<class UnaryOperation>
piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

10 Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

11 Preconditions: If nw = 0, let n = 1, otherwise let n = nw. The relation 0 < δ = (xmax - xmin)/n holds.

12 Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: Let b_k = xmin + k·δ for k = 0,…,n, and w_k = fw(b_k+δ/2) for k = 0,…,n-1.

13 Complexity: The number of invocations of fw does not exceed n.

vector<result_type> intervals() const;

14 Returns: A vector<result_type> whose size member returns n + 1 and whose operator[] member returns b_k when invoked with argument k for k = 0,…,n.

vector<result_type> densities() const;

15 Returns: A vector<result_type> whose size member returns n and whose operator[] member returns ρ_k when invoked with argument k for k = 0,…,n-1.

26.6.8.6.3 Class template piecewise_linear_distribution

A piecewise_linear_distribution random number distribution produces random numbers \( x, b_0 \leq x < b_n \), distributed over each subinterval \([b_i,b_{i+1})\) according to the probability density function

\[
p(x|b_0,\ldots,b_n,\rho_0,\ldots,\rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}, \text{ for } b_i \leq x < b_{i+1}.
\]

The n + 1 distribution parameters \( b_i \), also known as this distribution’s interval boundaries, shall satisfy the relation \( b_i < b_{i+1} \) for \( i = 0,…,n-1 \). Unless specified otherwise, the remaining n + 1 distribution parameters are calculated as \( \rho_k = w_k/S \) for \( k = 0,…,n \), in which the values \( w_k \), commonly known as the weights at boundaries, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

\[
0 < S = \frac{1}{2} \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k).
\]
template<class UnaryOperation>
    piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);

template<class UnaryOperation>
    piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

explicit piecewise_linear_distribution(const param_type& parm);

void reset();

// generating functions
template<class URBG>
    result_type operator()(URBG& g);

template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

// property functions
vector<result_type> intervals() const;
vector<result_type> densities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

};

Effects: Constructs a piecewise_linear_distribution object with $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$.

template<class InputIteratorB, class InputIteratorW>
    piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
        InputIteratorW firstW);

Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements (23.3.5.2). If firstB == lastB or ++firstB == lastB, let $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, [firstB, lastB) forms a sequence $b$ of length $n + 1$, the length of the sequence $w$ starting from firstW is at least $n + 1$, and any $w_k$ for $k \geq n + 1$ are ignored by the distribution.

Effects: Constructs a piecewise_linear_distribution object with parameters as specified above.

Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated from the following values: Let $b_k = xmin + k \cdot \delta$ for $k = 0, \ldots, n$, and let $w_k = fw(b_k)$ for $k = 0, \ldots, n$.

Complexity: The number of invocations of $fw$ does not exceed $n + 1$.

Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated from the following values: Let $b_k = xmin + k \cdot \delta$ for $k = 0, \ldots, n$, and let $w_k = fw(b_k)$ for $k = 0, \ldots, n$.

Complexity: The number of invocations of $fw$ does not exceed $n + 1$.

vector<result_type> intervals() const;

Returns: A vector<result_type> whose size member returns $n + 1$ and whose operator[] member returns $b_k$ when invoked with argument $k$ for $k = 0, \ldots, n$. 

§ 26.6.8.6.3 ©ISO/IEC 2020 – All rights reserved

ISO/IEC JTC1 SC22 WG21 N4860
vector<result_type> densities() const;

Returns: A vector<result_type> whose size member returns \( n \) and whose operator[] member returns \( \rho_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n \).

26.6.9 Low-quality random number generation
[c.math.rand]

[Note: The header <cstdlib> (17.2.2) declares the functions described in this subclause. — end note]

int rand();
void srand(unsigned int seed);

Effects: The rand and srand functions have the semantics specified in the C standard library.

Remarks: The implementation may specify that particular library functions may call rand. It is implementation-defined whether the rand function may introduce data races (16.5.5.10). [Note: The other random number generation facilities in this document (26.6) are often preferable to rand, because rand’s underlying algorithm is unspecified. Use of rand therefore continues to be non-portable, with unpredictable and oft-questionable quality and performance. — end note]

template<class T> valarray<bool> operator<=(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<=(const typename valarray<T>::value_type&, const valarray<T>&);
The header `<valarray>` defines five class templates (`valarray`, `slice_array`, `gslice_array`, `mask_array`, and `indirect_array`), two classes (`slice` and `gslice`), and a series of related function templates for representing and manipulating arrays of values.

The `valarray` array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.

Any function returning a `valarray<T>` is permitted to return an object of another type, provided all the const member functions of `valarray<T>` are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.

Implementations introducing such replacement types shall provide additional functions and operators as follows:

1. for every function taking a `const valarray<T>&` other than `begin` and `end` (26.7.10), identical functions taking the replacement types shall be added;
2. for every function taking two `const valarray<T>&` arguments, identical functions taking every combination of `const valarray<T>&` and replacement types shall be added.

Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for valarray expressions.

1 248
In particular, an implementation shall allow a `valarray<T>` to be constructed from such replacement types and shall allow assignments and compound assignments of such types to `valarray<T>`, `slice_array<T>`, `gslice_array<T>`, `mask_array<T>` and `indirect_array<T>` objects.

These library functions are permitted to throw a `bad_alloc` (17.6.3.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

### 26.7.2 Class template `valarray`

#### 26.7.2.1 Overview

```cpp
namespace std {
    template<class T> class valarray {
        public:
            using value_type = T;

            // 26.7.2.2, construct/destroy
            valarray();
            explicit valarray(size_t);
            valarray(const T& , size_t);
            valarray(const T* , size_t);
            valarray(const valarray&);
            valarray(valarray&&) noexcept;
            valarray(const slice_array<T>&);
            valarray(const gslice_array<T>&);
            valarray(const mask_array<T>&);
            valarray(const indirect_array<T>&);
            valarray(initializer_list<T>);
            ~valarray();

            // 26.7.2.3, assignment
            valarray& operator=(const valarray&);
            valarray& operator=(valarray&&) noexcept;
            valarray& operator=(initializer_list<T>);
            valarray& operator=(const T&);
            valarray& operator=(const slice_array<T>&);
            valarray& operator=(const gslice_array<T>&);
            valarray& operator=(const mask_array<T>&);
            valarray& operator=(const indirect_array<T>&);

            // 26.7.2.4, element access
            const T& operator[](size_t) const;
            T& operator[](size_t);

            // 26.7.2.5, subset operations
            valarray operator[](slice) const;
            slice_array<T> operator[](slice);
            valarray operator[](const gslice&)
                const;
            gslice_array<T> operator[](const gslice&)
                const;
            valarray operator[](const valarray<bool>&)
                const;
            mask_array<T> operator[](const valarray<bool>&);
            valarray operator[](const valarray<size_t>&)
                const;
            indirect_array<T> operator[](const valarray<size_t>&);

            // 26.7.2.6, unary operators
            valarray operator+( ) const;
            valarray operator-( ) const;
            valarray operator~( ) const;
            valarray<bool> operator!( ) const;

            // 26.7.2.7, compound assignment
            valarray& operator*= ( const T&);
            valarray& operator/= ( const T&);
            valarray& operator%= ( const T&);
            valarray& operator+= ( const T&);
```

§ 26.7.2.1 ©ISO/IEC 2020 – All rights reserved 1193
The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an “array” throughout the remainder of 26.7. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.

### 26.7.2.2 Constructors

```cpp
valarray();

Effects: Constructs a `valarray` that has zero length.\(^{250}\)

explicit valarray(size_t n);

Effects: Constructs a `valarray` that has length \(n\). Each element of the array is value-initialized (9.4).

valarray(const T& v, size_t n);

Effects: Constructs a `valarray` that has length \(n\). Each element of the array is initialized with \(v\).

valarray(const T* p, size_t n);

Preconditions: \([p, p + n)\) is a valid range.
```

\(^{249}\) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.

\(^{250}\) This default constructor is essential, since arrays of `valarray` may be useful. After initialization, the length of an empty array can be increased with the `resize` member function.
Effects: Constructs a `valarray` that has length n. The values of the elements of the array are initialized with the first n values pointed to by the first argument.\textsuperscript{251}

\begin{verbatim}
valarray(const valarray& v);
\end{verbatim}

Effects: Constructs a `valarray` that has the same length as v. The elements are initialized with the values of the corresponding elements of v.\textsuperscript{252}

\begin{verbatim}
valarray(valarray&& v) noexcept;
\end{verbatim}

Effects: Constructs a `valarray` that has the same length as v. The elements are initialized with the values of the corresponding elements of v.

Complexity: Constant.

\begin{verbatim}
valarray(initializer_list<T> il);
\end{verbatim}

Effects: Equivalent to `valarray(il.begin(), il.size())`.

\begin{verbatim}
valarray(const slice_array<T>&);
valarray(const gslice_array<T>&);
valarray(const mask_array<T>&);
valarray(const indirect_array<T>&);
\end{verbatim}

These conversion constructors convert one of the four reference templates to a `valarray`.

\begin{verbatim}
~valarray();
\end{verbatim}

Effects: The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

### 26.7.2.3 Assignment

\begin{verbatim}
valarray& operator=(const valarray& v);
\end{verbatim}

Effects: Each element of the `*this` array is assigned the value of the corresponding element of v. If the length of v is not equal to the length of `*this`, resizes `*this` to make the two arrays the same length, as if by calling `resize(v.size())`, before performing the assignment.

Postconditions: `size() == v.size()`.

Returns: `*this`.

\begin{verbatim}
valarray& operator=(valarray&& v) noexcept;
\end{verbatim}

Effects: `*this` obtains the value of v. The value of v after the assignment is not specified.

Returns: `*this`.

Complexity: Linear.

\begin{verbatim}
valarray& operator=(initializer_list<T> il);
\end{verbatim}

Effects: Equivalent to: `return *this = valarray(il);`

\begin{verbatim}
valarray& operator=(const T& v);
\end{verbatim}

Effects: Assigns v to each element of `*this`.

Returns: `*this`.

\begin{verbatim}
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);
\end{verbatim}

Preconditions: The length of the array to which the argument refers equals `size()`. The value of an element in the left-hand side of a `valarray` assignment operator does not depend on the value of another element in that left-hand side.

\textsuperscript{251} This constructor is the preferred method for converting a C array to a `valarray` object.

\textsuperscript{252} This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.
These operators allow the results of a generalized subscripting operation to be assigned directly to a `valarray`.

### 26.7.2.4 Element access

```cpp
const T& operator[](size_t n) const;
T& operator[](size_t n);
```

- **Preconditions:** \( n < \text{size}() \) is true.

- **Returns:** A reference to the corresponding element of the array. `[Note: The expression \((a[i] = q, a[i]) == q\) evaluates to `true` for any non-constant `valarray<T> a`, any `T q`, and for any `size_t i` such that the value of `i` is less than the length of `a`. —end note]`

- **Remarks:** The expression `addressof(a[i+j]) == addressof(a[i]) + j` evaluates to `true` for all `size_t i` and `size_t j` such that \( i + j < a\.size() \).

The expression `addressof(a[i]) != addressof(b[j])` evaluates to `true` for any two arrays `a` and `b` and for any `size_t i` and `size_t j` such that \( i < a\.size() \) and \( j < b\.size() \). `[Note: This property indicates an absence of aliasing and may be used to advantage by optimizing compilers. Compilers may take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from `operator new`, and other techniques to generate efficient `valarrays`. —end note]`

The reference returned by the subscript operator for an array shall be valid until the member function `resize(size_t, T)` (26.7.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

### 26.7.2.5 Subset operations

The member `operator[]` is overloaded to provide several ways to select sequences of elements from among those controlled by `*this`. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new `valarray` object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of `operator=` and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

```cpp
valarray operator[](slice slicearr) const;
```

- **Returns:** A `valarray` containing those elements of the controlled sequence designated by `slicearr`. `[Example:]
  ```cpp
cost valarray<char> v0("abcdefghijklmnop", 16);
  // v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
  
  —end example
  ```

```cpp
slice_array<T> operator[](slice slicearr);
```

- **Returns:** An object that holds references to elements of the controlled sequence selected by `slicearr`. `[Example:]
  ```cpp
  valarray<char> v0("abcdefghijklmnop", 16);
  valarray<char> v1("ABCDE", 5);
  v0[slice(2, 5, 3)] = v1;
  // v0 == valarray<char>("abAdBghCjkDmnEp", 16);
  
  —end example
  ```

```cpp
valarray operator[](const gslice& gslicearr) const;
```

- **Returns:** A `valarray` containing those elements of the controlled sequence designated by `gslicearr`. `[Example:]
  ```cpp
  const valarray<char> v0("abcdefghijklmnop", 16);
  const size_t lv[] = { 2, 3 };
  const size_t dv[] = { 7, 2 };
  const valarray<
  size_t> len(lv, 2), str(dv, 2);
  // v0[gslice(3, len, str)] returns
  // valarray<char>("dfhkmn", 6)
  
  —end example
  ```
gslice_array<T> operator[](const gslice& galicearr);

5  Returns: An object that holds references to elements of the controlled sequence selected by galicearr.
  [Example:
   valarray<char> v0("abcdefhijklmop", 16);
   valarray<char> v1("ABCDEFGHIJKLMNOPQRSTUVWXYZ", 6);
   const size_t lv[] = { 2, 3 };
   const size_t dv[] = { 7, 2 };
   const valarray<size_t> len(lv, 2), str(dv, 2);
   v0[gslice(3, len, str)] = v1;
   // v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
  — end example]

valarray operator[](const valarray<bool>& boolarr) const;

6  Returns: A valarray containing those elements of the controlled sequence designated by boolarr.
  [Example:
   const valarray<char> v0("abcdefhijklmop", 16);
   const bool vb[] = { false, false, true, true, false, true };
   // v0[valarray<bool>(vb, 6)] returns
   // valarray<char>("cdf", 3)
  — end example]

mask_array<T> operator[](const valarray<bool>& boolarr);

7  Returns: An object that holds references to elements of the controlled sequence selected by boolarr.
  [Example:
   valarray<char> v0("abcdefhijklmop", 16);
   valarray<char> v1("ABCDEFGHIJKLMNOPQRSTUVWXYZ", 6);
   const bool vb[] = { false, false, true, true, false, true };
   v0[valarray<bool>(vb, 6)] = v1;
   // v0 == valarray<char>("abABeCghijklmnop", 16)
  — end example]

valarray operator[](const valarray<size_t>& indarr) const;

8  Returns: A valarray containing those elements of the controlled sequence designated by indarr.
  [Example:
   const valarray<char> v0("abcdefhijklmop", 16);
   const size_t vi[] = { 7, 5, 2, 3, 8 };
   // v0[valarray<size_t>(vi, 5)] returns
   // valarray<char>("hfcdi", 5)
  — end example]

indirect_array<T> operator[](const valarray<size_t>& indarr);

9  Returns: An object that holds references to elements of the controlled sequence selected by indarr.
  [Example:
   valarray<char> v0("abcdefhijklmop", 16);
   valarray<char> v1("ABCDEFGHIJKLMNOPQRSTUVWXYZ", 5);
   const size_t vi[] = { 7, 5, 2, 3, 8 };
   v0[indirect_array<size_t>(vi, 5)] = v1;
   // v0 == valarray<char>("abCDeBgaEjklmnop", 16)
  — end example]

26.7.2.6 Unary operators
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray&lt;bool&gt; operator!() const;

Mandates: The indicated operator can be applied to operands of type T and returns a value of type T (bool for operator!) or which may be unambiguously implicitly converted to type T (bool for operator!).

Returns: A valarray whose length is size(). Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

26.7.2.7 Compound assignment

valarray&lt;&gt; operator== (const valarray&lt;&gt; v);
valarray&lt;&gt; operator/= (const valarray&lt;&gt; v);
valarray&lt;&gt; operator%=(const valarray&lt;&gt; v);
valarray&lt;&gt; operator+=(const valarray&lt;&gt; v);
valarray&lt;&gt; operator-=(const valarray&lt;&gt; v);
valarray&lt;&gt; operator^=(const valarray&lt;&gt; v);
valarray&lt;&gt; operator&=(const valarray&lt;&gt; v);
valarray&lt;&gt; operator|=(const valarray&lt;&gt; v);
valarray&lt;&gt; operator<<=(const valarray&lt;&gt; v);
valarray&lt;&gt; operator>>=(const valarray&lt;&gt; v);

Mandates: The indicated operator can be applied to two operands of type T.

Preconditions: size() == v.size() is true.

The value of an element in the left-hand side of a valarray compound assignment operator does not depend on the value of another element in that left hand side.

Effects: Each of these operators performs the indicated operation on each of the elements of *this and the corresponding element of v.

Returns: *this.

Remarks: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

valarray&lt;&gt; operator== (const T & v);
valarray&lt;&gt; operator/= (const T & v);
valarray&lt;&gt; operator%=(const T & v);
valarray&lt;&gt; operator+=(const T & v);
valarray&lt;&gt; operator-=(const T & v);
valarray&lt;&gt; operator^=(const T & v);
valarray&lt;&gt; operator&=(const T & v);
valarray&lt;&gt; operator|=(const T & v);
valarray&lt;&gt; operator<<=(const T & v);
valarray&lt;&gt; operator>>=(const T & v);

Mandates: The indicated operator can be applied to two operands of type T.

Effects: Each of these operators applies the indicated operation to each element of *this and v.

Returns: *this.

Remarks: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

26.7.2.8 Member functions

void swap(valarray&lt;&gt; v) noexcept;

Effects: *this obtains the value of v. v obtains the value of *this.

Complexity: Constant.

size_t size() const;

Returns: The number of elements in the array.

Complexity: Constant time.
T sum() const;

Mandates: operator+= can be applied to operands of type T.

Preconditions: size() > 0 is true.

Returns: The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying operator+= to a copy of an element of the array and all other elements of the array in an unspecified order.

T min() const;

Preconditions: size() > 0 is true.

Returns: The minimum value contained in *this. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using operator<.

T max() const;

Preconditions: size() > 0 is true.

Returns: The maximum value contained in *this. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using operator<.

valarray shift(int n) const;

Returns: A valarray of length size(), each of whose elements I is (*this)[I + n] if I + n is non-negative and less than size(), otherwise T(). [Note: If element zero is taken as the leftmost element, a positive value of n shifts the elements left n places, with zero fill. — end note]

[Example: If the argument has the value -2, the first two elements of the result will be value-initialized (9.4); the third element of the result will be assigned the value of the first element of the argument; etc. — end example]

valarray cshift(int n) const;

Returns: A valarray of length size() that is a circular shift of *this. If element zero is taken as the leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative value of n shifts the elements circularly right −n places.

valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;

Returns: A valarray whose length is size(). Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of *this.

void resize(size_t sz, T c = T());

Effects: Changes the length of the *this array to sz and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

26.7.3 valarray non-member operations [valarray.nonmembers]

26.7.3.1 Binary operators [valarray.binary]

template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&, const valarray<T>&);

Mandates: The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

Preconditions: The argument arrays have the same length.
Returns: A `valarray` whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```cpp
template<class T> valarray<T> operator* (const valarray<T>&, const typename valarray<T>::value_type&);
```

```cpp
template<class T> valarray<T> operator* (const typename valarray<T>::value_type&, const valarray<T>&);
```

```cpp
template<class T> valarray<T> operator/ (const valarray<T>&, const typename valarray<T>::value_type&);
```

```cpp
template<class T> valarray<T> operator/ (const typename valarray<T>::value_type&, const valarray<T>&);
```

```cpp
template<class T> valarray<T> operator% (const valarray<T>&, const typename valarray<T>::value_type&);
```

```cpp
template<class T> valarray<T> operator% (const typename valarray<T>::value_type&, const valarray<T>&);
```

```cpp
template<class T> valarray<T> operator+ (const valarray<T>&, const typename valarray<T>::value_type&);
```

```cpp
template<class T> valarray<T> operator+ (const typename valarray<T>::value_type&, const valarray<T>&);
```

```cpp
template<class T> valarray<T> operator- (const valarray<T>&, const typename valarray<T>::value_type&);
```

```cpp
template<class T> valarray<T> operator- (const typename valarray<T>::value_type&, const valarray<T>&);
```

```cpp
template<class T> valarray<T> operator^ (const valarray<T>&, const typename valarray<T>::value_type&);
```

```cpp
template<class T> valarray<T> operator^ (const typename valarray<T>::value_type&, const valarray<T>&);
```

```cpp
template<class T> valarray<T> operator& (const valarray<T>&, const typename valarray<T>::value_type&);
```

```cpp
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&, const valarray<T>&);
```

```cpp
template<class T> valarray<T> operator| (const valarray<T>&, const typename valarray<T>::value_type&);
```

```cpp
template<class T> valarray<T> operator| (const typename valarray<T>::value_type&, const valarray<T>&);
```

```cpp
template<class T> valarray<T> operator<<(const valarray<T>&, const typename valarray<T>::value_type&);
```

```cpp
template<class T> valarray<T> operator>>(const valarray<T>&, const typename valarray<T>::value_type&);
```

```cpp
template<class T> valarray<T> operator>>(const typename valarray<T>::value_type&, const valarray<T>&);
```

Mandates: The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

Returns: A `valarray` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

26.7.3.2 Logical operators

```cpp
template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);
```

```cpp
template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);
```

```cpp
template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);
```

```cpp
template<class T> valarray<bool> operator> (const valarray<T>&, const valarray<T>&);
```

```cpp
template<class T> valarray<bool> operator<=(const valarray<T>&, const valarray<T>&);
```

```cpp
template<class T> valarray<bool> operator>=(const valarray<T>&, const valarray<T>&);
```

```cpp
template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);
```

```cpp
template<class T> valarray<bool> operator||(const valarray<T>&, const valarray<T>&);
```

Mandates: The indicated operator can be applied to operands of type T and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.
Preconditions: The two array arguments have the same length.

Returns: A valarray<bool> whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```cpp
template<class T> valarray<bool> operator==(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator==(const typename valarray<T>::value_type&, const valarray<T>&);

Mandates: The indicated operator can be applied to operands of type T and returns a value of type bool or which can be unambiguously implicitly converted to bool.

Returns: A valarray<bool> whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

26.7.3.3 Transcendentals

```cpp
template<class T> valarray<T> abs (const valarray<T>&);
template<class T> valarray<T> acos (const valarray<T>&);
template<class T> valarray<T> asin (const valarray<T>&);
template<class T> valarray<T> atan (const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> atan2(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> cos (const valarray<T>&);
template<class T> valarray<T> cosh (const valarray<T>&);
template<class T> valarray<T> exp (const valarray<T>&);
```
template<class T> valarray<T> tan (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);

1  Mandates: A unique function with the indicated name can be applied (unqualified) to an operand of type T. This function returns a value of type T or which can be unambiguously implicitly converted to type T.

26.7.3.4 Specialized algorithms

template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;

1  Effects: Equivalent to x.swap(y).

26.7.4 Class slice

26.7.4.1 Overview

namespace std {
    class slice {
        public:
            slice();
            slice(size_t, size_t, size_t);
            size_t start() const;
            size_t size() const;
            size_t stride() const;

            friend bool operator==(const slice& x, const slice& y);
    }
}

The slice class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.\textsuperscript{253}

26.7.4.2 Constructors

slice();
slice(size_t start, size_t length, size_t stride);
slice(const slice&);

1  The default constructor is equivalent to slice(0, 0, 0). A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.

2  \textit{Example}: slice(3, 8, 2) constructs a slice which selects elements 3, 5, 7, ..., 17 from an array. \textit{— end example}

26.7.4.3 Access functions

size_t start() const;
size_t size() const;
size_t stride() const;

1  Returns: The start, length, or stride specified by a slice object.

2  Complexity: Constant time.

26.7.4.4 Operators

friend bool operator==(const slice& x, const slice& y);

1  Effects: Equivalent to:

\[
\text{return } x.\text{start()} == y.\text{start()} \&\& x.\text{size()} == y.\text{size()} \&\& x.\text{stride()} == y.\text{stride();}
\]

\textsuperscript{253} BLAS stands for Basic Linear Algebra Subprograms. C++ programs may instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammarling: \textit{A set of Level 3 Basic Linear Algebra Subprograms}; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.
26.7.5 Class template slice_array

26.7.5.1 Overview

namespace std {
    template<class T> class slice_array {
    public:
        using value_type = T;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<=(const valarray<T>&) const;
        void operator>>=(const valarray<T>&) const;

        slice_array(const slice_array&);
        ~slice_array();
        const slice_array& operator=(const slice_array&) const;
        void operator=(const T&) const;

        slice_array() = delete; // as implied by declaring copy constructor above
    };
}

1 This template is a helper template used by the slice subscript operator

    slice_array<T> valarray<T>::operator[] (slice);

2 It has reference semantics to a subset of an array specified by a slice object. [Example: The expression
    a[slice(1, 5, 3)] = b; has the effect of assigning the elements of b to a slice of the elements in a. For
    the slice shown, the elements selected from a are 1, 4, . . . , 13. — end example]

26.7.5.2 Assignment

    void operator=(const valarray<T>&) const;
    const slice_array& operator=(const slice_array&) const;

1 These assignment operators have reference semantics, assigning the values of the argument array
    elements to selected elements of the valarray<T> object to which the slice_array object refers.

26.7.5.3 Compound assignment

    void operator== (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

1 These compound assignments have reference semantics, applying the indicated operation to the elements
    of the argument array and selected elements of the valarray<T> object to which the slice_array
    object refers.

26.7.5.4 Fill function

    void operator=(const T&) const;

1 This function has reference semantics, assigning the value of its argument to the elements of the
    valarray<T> object to which the slice_array object refers.
26.7.6 The \texttt{gslice} class

26.7.6.1 Overview

namespace std {
    class gslice {
    public:
        gslice();
        gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);
        size_t start() const;
        valarray<size_t> size() const;
        valarray<size_t> stride() const;
    };
}

1 This class represents a generalized slice out of an array. A \texttt{gslice} is defined by a starting offset ($s$), a set of lengths ($l_j$), and a set of strides ($d_j$). The number of lengths shall equal the number of strides.

2 A \texttt{gslice} represents a mapping from a set of indices ($i_j$), equal in number to the number of strides, to a single index $k$. It is useful for building multidimensional array classes using the \texttt{valarray} template, which is one-dimensional. The set of one-dimensional index values specified by a \texttt{gslice} are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices $i_j$ range in value from 0 to $l_j - 1$.

3 [Example: The \texttt{gslice} specification

\begin{verbatim}
start = 3
length = (2, 4, 3)
stride = (19, 4, 1)
\end{verbatim}

yields the sequence of one-dimensional indices

$$k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1$$

which are ordered as shown in the following table:

$$(i_0, i_1, i_2, k) =$$

$$(0, 0, 0, 3),$$
$$(0, 0, 1, 4),$$
$$(0, 0, 2, 5),$$
$$(0, 1, 0, 7),$$
$$(0, 1, 1, 8),$$
$$(0, 1, 2, 9),$$
$$(0, 2, 0, 11),$$
$$(0, 2, 1, 12),$$
$$(0, 2, 2, 13),$$
$$(0, 3, 0, 15),$$
$$(0, 3, 1, 16),$$
$$(0, 3, 2, 17),$$
$$(1, 0, 0, 22),$$
$$(1, 0, 1, 23),$$
$$\ldots$$
$$(1, 3, 2, 36)$$

That is, the highest-ordered index turns fastest. —end example]

4 It is possible to have degenerate generalized slices in which an address is repeated.

5 [Example: If the stride parameters in the previous example are changed to \{1, 1, 1\}, the first few elements of the resulting sequence of indices will be

$$(0, 0, 0, 3),$$
$$(0, 0, 1, 4),$$

1204

ISO/IEC JTC1 SC22 WG21 N4860
If a degenerate slice is used as the argument to the non-\texttt{const} version of \texttt{operator[]} (const \texttt{gslice&}), the behavior is undefined.

### 26.7.6.2 Constructors

\begin{verbatim}
gslice();
gslice(size_t start, const valarray<size_t>& lengths,
        const valarray<size_t>& strides);
gslice(const gslice&);
\end{verbatim}

The default constructor is equivalent to \texttt{gslice(0, valarray<size_t>(), valarray<size_t>())}.

The constructor with arguments builds a \texttt{gslice} based on a specification of start, lengths, and strides, as explained in the previous subclause.

### 26.7.6.3 Access functions

\begin{verbatim}
size_t start() const;
valarray<size_t> size() const;
valarray<size_t> stride() const;
\end{verbatim}

\texttt{start()} returns the representation of the start, lengths, or strides specified for the \texttt{gslice}.

\texttt{size()} and \texttt{stride()} are linear in the number of strides.

### 26.7.7 Class template gslice_array

#### 26.7.7.1 Overview

\begin{verbatim}
namespace std {
    template<class T> class gslice_array {
    public:
        using value_type = T;
        ...}
\end{verbatim}

This template is a helper template used by the \texttt{gslice} subscript operator

\begin{verbatim}
gslice_array<T> valarray<T>::operator[](const gslice&);
\end{verbatim}

It has reference semantics to a subset of an array specified by a \texttt{gslice} object. Thus, the expression \texttt{a[gslice(1, length, stride)] = b} has the effect of assigning the elements of \texttt{b} to a generalized slice of the elements in \texttt{a}.
26.7.7.2 Assignment

void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the valarray<T> object to which the gslice_array refers.

26.7.7.3 Compound assignment

void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the valarray<T> object to which the gslice_array object refers.

26.7.7.4 Fill function

void operator=(const T&) const;

This function has reference semantics, assigning the value of its argument to the elements of the valarray<T> object to which the gslice_array object refers.

26.7.8 Class template mask_array

namespace std {
  template<class T> class mask_array {
    public:
      using value_type = T;

      void operator=(const valarray<T>&) const;
      void operator*=(const valarray<T>&) const;
      void operator/=(const valarray<T>&) const;
      void operator%=(const valarray<T>&) const;
      void operator-= (const valarray<T>&) const;
      void operator+= (const valarray<T>&) const;
      void operator^=(const valarray<T>&) const;
      void operator&=(const valarray<T>&) const;
      void operator|=(const valarray<T>&) const;
      void operator<<=(const valarray<T>&) const;
      void operator>>=(const valarray<T>&) const;
      mask_array(const mask_array&);
      ~mask_array();
      const mask_array& operator=(const mask_array&) const;
      void operator=(const T&) const;
      mask_array() = delete; // as implied by declaring copy constructor above
  }
}

This template is a helper template used by the mask subscript operator:

mask_array<T> valarray<T>::operator[](const valarray<bool>&).

It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression a[mask] = b; has the effect of assigning the elements of b to the masked elements in a (those for which the corresponding element in mask is true).
26.7.8.2 Assignment

void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the valarray<T> object to which it refers.

26.7.8.3 Compound assignment

void operator** (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the valarray<T> object to which the mask object refers.

26.7.8.4 Fill function

void operator=(const T&) const;

1 This function has reference semantics, assigning the value of its argument to the elements of the valarray<T> object to which the mask_array object refers.

26.7.9 Class template indirect_array

26.7.9.1 Overview

namespace std {
 template<class T> class indirect_array {
 public:
   using value_type = T;

   void operator= (const valarray<T>&) const;
   void operator** (const valarray<T>&) const;
   void operator/= (const valarray<T>&) const;
   void operator%= (const valarray<T>&) const;
   void operator+= (const valarray<T>&) const;
   void operator-= (const valarray<T>&) const;
   void operator^= (const valarray<T>&) const;
   void operator&= (const valarray<T>&) const;
   void operator|= (const valarray<T>&) const;
   void operator<<=(const valarray<T>&) const;
   void operator>>=(const valarray<T>&) const;

   indirect_array(const indirect_array&);
   ~indirect_array();
   const indirect_array& operator=(const indirect_array&); const;
   void operator=(const T&) const;

   indirect_array() = delete; // as implied by declaring copy constructor above

   }

1 This template is a helper template used by the indirect subscript operator
indirect_array<T> valarray<T>::operator[](const valarray<size_t>&).

2 It has reference semantics to a subset of an array specified by an indirect_array. Thus, the expression
a[indirect] = b; has the effect of assigning the elements of b to the elements in a whose indices appear in indirect.
26.7.9.2 Assignment

void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the valarray<T> object to which it refers.

2 If the indirect_array specifies an element in the valarray<T> object to which it refers more than once, the behavior is undefined.

[Example:
int addr[] = {2, 3, 1, 4, 4};
valarray<size_t> indirect(addr, 5);
valarray<double> a(0., 10), b(1., 5);
a[indirect] = b;
results in undefined behavior since element 4 is specified twice in the indirection. — end example]

26.7.9.3 Compound assignment

void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the valarray<T> object to which the indirect_array object refers.

2 If the indirect_array specifies an element in the valarray<T> object to which it refers more than once, the behavior is undefined.

26.7.9.4 Fill function

void operator=(const T&) const;

This function has reference semantics, assigning the value of its argument to the elements of the valarray<T> object to which the indirect_array object refers.

26.7.10 valarray range access

In the begin and end function templates that follow, unspecified1 is a type that meets the requirements of a mutable Cpp17RandomAccessIterator (23.3.5.6) and models contiguous_iterator (23.3.4.14), whose value_type is the template parameter T and whose reference type is T&. unspecified2 is a type that meets the requirements of a constant Cpp17RandomAccessIterator and models contiguous_iterator, whose value_type is the template parameter T and whose reference type is const T&.

1 The iterators returned by begin and end for an array are guaranteed to be valid until the member function resize(size_t, T) (26.7.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);

Returns: An iterator referencing the first value in the array.

template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);

Returns: An iterator referencing one past the last value in the array.
26.8 Mathematical functions for floating-point types

long double sph_bessell(unsigned n, long double x);

// 26.8.6.20, spherical associated Legendre functions
double sph_legendre(unsigned l, unsigned m, double theta);
float sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);

// 26.8.6.21, spherical Neumann functions;
// spherical Bessel functions of the second kind
double sph_neumann(unsigned n, double x);
float sph_neumannf(unsigned n, float x);
long double sph_neunnal(unsigned n, long double x);

1 The contents and meaning of the header <cmath> are the same as the C standard library header <math.h>, with the addition of a three-dimensional hypotenuse function (26.8.3) and the mathematical special functions described in 26.8.6. [Note: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2). — end note]

2 For each set of overloaded functions within <cmath>, with the exception of abs, there shall be additional overloads sufficient to ensure:

(2.1) — If any argument of arithmetic type corresponding to a double parameter has type long double, then all arguments of arithmetic type (6.8.1) corresponding to double parameters are effectively cast to long double.

(2.2) — Otherwise, if any argument of arithmetic type corresponding to a double parameter has type double or an integer type, then all arguments of arithmetic type corresponding to double parameters are effectively cast to double.

(2.3) — [Note: Otherwise, all arguments of arithmetic type corresponding to double parameters have type float. — end note]

[Note: abs is exempted from these rules in order to stay compatible with C. — end note]

See also: ISO C 7.12

26.8.2 Absolute values [c.math.abs]

1 [Note: The headers <cstdlib> (17.2.2) and <cmath> (26.8.1) declare the functions described in this subclause. — end note]

int abs(int j);
long int abs(long int j);
long long int abs(long long int j);
float abs(float j);
double abs(double j);
long double abs(long double j);

Effects: The abs functions have the semantics specified in the C standard library for the functions abs, labs, llabs, fabsf, fabs, and fabsl.

Remarks: If abs() is called with an argument of type X for which is_unsigned_v<X> is true and if X cannot be converted to int by integral promotion (7.3.6), the program is ill-formed. [Note: Arguments that can be promoted to int are permitted for compatibility with C. —end note]

See also: ISO C 7.12.7.2, 7.22.6.1

26.8.3 Three-dimensional hypotenuse
[.c.math.hypot3]

float hypot(float x, float y, float z);
double hypot(double x, double y, double z);
long double hypot(long double x, long double y, long double z);

Returns: $\sqrt{x^2 + y^2 + z^2}$.

26.8.4 Linear interpolation
[.c.math.lerp]

constexpr float lerp(float a, float b, float t) noexcept;
constexpr double lerp(double a, double b, double t) noexcept;
constexpr long double lerp(long double a, long double b, long double t) noexcept;

Returns: $a + t(b - a)$.

Remarks: Let $r$ be the value returned. If isfinite(a) && isfinite(b), then:

(2.1) — If $t == 0$, then $r == a$.
(2.2) — If $t == 1$, then $r == b$.
(2.3) — If $t >= 0$ && $t <= 1$, then isfinite(r).
(2.4) — If isfinite(t) && a == b, then $r == a$.
(2.5) — If isfinite(t) || !isnan(t) && b-a != 0, then !isnan(r).

Let CMP(x,y) be 1 if x > y, -1 if x < y, and 0 otherwise. For any t1 and t2, the product of CMP(lerp(a, b, t2), lerp(a, b, t1)), CMP(t2, t1), and CMP(b, a) is non-negative.

26.8.5 Classification / comparison functions
[.c.math.fpclass]

The classification / comparison functions behave the same as the C macros with the corresponding names defined in the C standard library. Each function is overloaded for the three floating-point types.

See also: ISO C 7.12.3, 7.12.4

26.8.6 Mathematical special functions
[sf.cmath]

If any argument value to any of the functions specified in this subclause is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:

(1.1) — the function description’s Returns: clause explicitly specifies a domain and those argument values fall outside the specified domain, or
(1.2) — the corresponding mathematical function value has a nonzero imaginary component, or
(1.3) — the corresponding mathematical function is not mathematically defined.\(^\dagger\)

Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

26.8.6.1 Associated Laguerre polynomials
[sf.cmath.assoc.laguerre]

double assoc_laguerre(unsigned n, unsigned m, double x);
float assoc_laguerref(unsigned n, unsigned m, float x);

\(^\dagger\) A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.
long double assoc_laguerrel(unsigned n, unsigned m, long double x);
1
   Effects: These functions compute the associated Laguerre polynomials of their respective arguments n, m, and x.
2
   Returns:
   \[ L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x), \quad \text{for } x \geq 0, \]
   where \( n \) is \( n \), \( m \) is \( m \), and \( x \) is \( x \).
3
   Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \) or if \( m \geq 128 \).

26.8.6.2 Associated Legendre functions

double assoc_legendre(unsigned l, unsigned m, double x);
float assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);
1
   Effects: These functions compute the associated Legendre functions of their respective arguments \( l \), \( m \), and \( x \).
2
   Returns:
   \[ P_l^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_l(x), \quad \text{for } |x| \leq 1, \]
   where \( l \) is \( l \), \( m \) is \( m \), and \( x \) is \( x \).
3
   Remarks: The effect of calling each of these functions is implementation-defined if \( l \geq 128 \).

26.8.6.3 Beta function

double beta(double x, double y);
float betaf(float x, float y);
long double betal(long double x, long double y);
1
   Effects: These functions compute the beta function of their respective arguments \( x \) and \( y \).
2
   Returns:
   \[ \beta(x, y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x + y)}, \quad \text{for } x > 0, \; y > 0, \]
   where \( x \) is \( x \) and \( y \) is \( y \).

26.8.6.4 Complete elliptic integral of the first kind

double comp_ellint_1(double k);
float comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);
1
   Effects: These functions compute the complete elliptic integral of the first kind of their respective arguments \( k \).
2
   Returns:
   \[ K(k) = F(k, \pi/2), \quad \text{for } |k| \leq 1, \]
   where \( k \) is \( k \).
3
   See also 26.8.6.11.

26.8.6.5 Complete elliptic integral of the second kind

double comp_ellint_2(double k);
float comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);
1
   Effects: These functions compute the complete elliptic integral of the second kind of their respective arguments \( k \).
2
   Returns:
   \[ E(k) = E(k, \pi/2), \quad \text{for } |k| \leq 1, \]
   where \( k \) is \( k \).
3
   See also 26.8.6.12.
26.8.6.6 Complete elliptic integral of the third kind

double comp_ellint_3(double k, double nu);
float comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);

Effects: These functions compute the complete elliptic integral of the third kind of their respective arguments k and nu.

Returns:

\[ \Pi(\nu,k) = \Pi(\nu,k,\pi/2) \], for \( |k| \leq 1 \),

where k is k and \( \nu \) is nu.

See also 26.8.6.13.

26.8.6.7 Regular modified cylindrical Bessel functions

double cyl_bessel_i(double nu, double x);
float cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);

Effects: These functions compute the regular modified cylindrical Bessel functions of their respective arguments \( \nu \) and \( x \).

Returns:

\[ I_\nu(x) = \frac{1}{\pi} \int_0^\infty \frac{\sin(xt)}{(t^2 + \nu^2)^{1/2}} \, dt \]

where \( \nu \) is nu and \( x \) is x.

Remarks: The effect of calling each of these functions is implementation-defined if \( \nu \geq 128 \).

See also 26.8.6.8.

26.8.6.8 Cylindrical Bessel functions of the first kind

double cyl_bessel_j(double nu, double x);
float cyl_bessel_jf(float nu, float x);
long double cyl_bessel jl(long double nu, long double x);

Effects: These functions compute the cylindrical Bessel functions of the first kind of their respective arguments \( \nu \) and \( x \).

Returns:

\[ J_\nu(x) = \frac{(-1)^k}{\pi k! \Gamma(\nu + k + 1)} \sum_{k=0}^\infty \frac{(x/2)^{\nu+2k}}{k!} \]

where \( \nu \) is nu and \( x \) is x.

Remarks: The effect of calling each of these functions is implementation-defined if \( \nu \geq 128 \).

See also 26.8.6.7, 26.8.6.8, 26.8.6.10.

26.8.6.9 Irregular modified cylindrical Bessel functions

double cyl_bessel_k(double nu, double x);
float cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);

Effects: These functions compute the irregular modified cylindrical Bessel functions of their respective arguments \( \nu \) and \( x \).

Returns:

\[ K_\nu(x) = (\pi/2)^{\nu+1} (I_\nu(ix) + iN_\nu(ix)) = \begin{cases} \frac{\pi}{2} \frac{1_\nu(x) - I_\nu(x)}{\sin \nu \pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \frac{\pi}{2} \lim_{\mu \to \nu} \frac{1_\nu(x) - I_\nu(x)}{\sin \mu \pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases} \]

where \( \nu \) is nu and \( x \) is x.

Remarks: The effect of calling each of these functions is implementation-defined if \( \nu \geq 128 \).

See also 26.8.6.7, 26.8.6.8, 26.8.6.10.
26.8.6.10 Cylindrical Neumann functions

\begin{verbatim}
double cyl_neumann(double nu, double x);
float cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
\end{verbatim}

**Effects:** These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments \(\nu\) and \(x\).

**Returns:**
\[
    N_\nu(x) = \begin{cases} 
        \frac{J_\nu(x) \cos \nu \pi - J_{-\nu}(x)}{\sin \nu \pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\
        \lim_{\mu \to \nu} \frac{J_\mu(x) \cos \mu \pi - J_{-\mu}(x)}{\sin \mu \pi}, & \text{for } x \geq 0 \text{ and integral } \nu
    \end{cases}
\]

where \(\nu\) is \(nu\) and \(x\) is \(x\).

**Remarks:** The effect of calling each of these functions is implementation-defined if \(nu >= 128\).

See also 26.8.6.8.

26.8.6.11 Incomplete elliptic integral of the first kind

\begin{verbatim}
double ellint_1(double k, double phi);
float ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
\end{verbatim}

**Effects:** These functions compute the incomplete elliptic integral of the first kind of their respective arguments \(k\) and \(phi\) (\(phi\) measured in radians).

**Returns:**
\[
    F(k, \phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \text{ for } |k| \leq 1,
\]

where \(k\) is \(k\) and \(\phi\) is \(phi\).

26.8.6.12 Incomplete elliptic integral of the second kind

\begin{verbatim}
double ellint_2(double k, double phi);
float ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
\end{verbatim}

**Effects:** These functions compute the incomplete elliptic integral of the second kind of their respective arguments \(k\) and \(phi\) (\(phi\) measured in radians).

**Returns:**
\[
    E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta} \, d\theta, \text{ for } |k| \leq 1,
\]

where \(k\) is \(k\) and \(\phi\) is \(phi\).

26.8.6.13 Incomplete elliptic integral of the third kind

\begin{verbatim}
double ellint_3(double k, double nu, double phi);
float ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
\end{verbatim}

**Effects:** These functions compute the incomplete elliptic integral of the third kind of their respective arguments \(k\), \(nu\), and \(phi\) (\(phi\) measured in radians).

**Returns:**
\[
    \Pi(\nu, k, \phi) = \int_0^\phi \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}, \text{ for } |k| \leq 1,
\]

where \(\nu\) is \(nu\), \(k\) is \(k\), and \(\phi\) is \(phi\).
### 26.8.6.14 Exponential integral

```c
double expint(double x);
float expintf(float x);
long double expintl(long double x);
```

**Effects:** These functions compute the exponential integral of their respective arguments \( x \).

**Returns:**

\[
E_i(x) = -\int_{-x}^{\infty} \frac{e^{-t}}{t} \, dt
\]

where \( x \) is \( x \).

### 26.8.6.15 Hermite polynomials

```c
double hermite(unsigned n, double x);
float hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

**Effects:** These functions compute the Hermite polynomials of their respective arguments \( n \) and \( x \).

**Returns:**

\[
H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}
\]

where \( n \) is \( n \) and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

### 26.8.6.16 Laguerre polynomials

```c
double laguerre(unsigned n, double x);
float laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

**Effects:** These functions compute the Laguerre polynomials of their respective arguments \( n \) and \( x \).

**Returns:**

\[
L_n(x) = e^x \frac{d^n}{dx^n} (xe^{-x}) , \text{ for } x \geq 0,
\]

where \( n \) is \( n \) and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

### 26.8.6.17 Legendre polynomials

```c
double legendre(unsigned l, double x);
float legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

**Effects:** These functions compute the Legendre polynomials of their respective arguments \( l \) and \( x \).

**Returns:**

\[
P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l , \text{ for } |x| \leq 1,
\]

where \( l \) is \( l \) and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( l \geq 128 \).

### 26.8.6.18 Riemann zeta function

```c
double riemann_zeta(double x);
float riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

**Effects:** These functions compute the Riemann zeta function of their respective arguments \( x \).
Returns:
ζ(x) = \begin{cases} 
\sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\
\frac{1}{1 - 2^{-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\
2^x \pi^{x-1} \sin(\frac{\pi x}{2}) \Gamma(1 - x) \zeta(1 - x), & \text{for } x < 0
\end{cases}

where x is x.

### 26.8.6.19 Spherical Bessel functions of the first kind [sf.cmath.sph.bessel]

```c
double sph_bessel(unsigned n, double x);
float sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

**Effects:** These functions compute the spherical Bessel functions of the first kind of their respective arguments n and x.

**Returns:**
\( j_n(x) = (\pi/2x)^{1/2} J_{n+1/2}(x) \), for \( x \geq 0 \),

where \( n \) is n and \( x \) is x.

**Remarks:** The effect of calling each of these functions is implementation-defined if \( n >= 128 \).

See also 26.8.6.8.

### 26.8.6.20 Spherical associated Legendre functions [sf.cmath.sph.legendre]

```c
double sph_legendre(unsigned l, unsigned m, double theta);
float sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

**Effects:** These functions compute the spherical associated Legendre functions of their respective arguments \( l, m \), and \( theta \) (\( theta \) measured in radians).

**Returns:**
\( Y^m_\ell(\theta, 0) \)

where
\( Y^m_\ell(\theta, \phi) = (-1)^m \left( \frac{(2\ell + 1)(\ell - m)!}{4\pi (\ell + m)!} \right)^{1/2} P^m_\ell(\cos \theta)e^{im\phi} \), for \( |m| \leq \ell \),

and \( \ell \) is \( l \), \( m \) is \( m \), and \( \theta \) is \( theta \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( l >= 128 \).

See also 26.8.6.2.

### 26.8.6.21 Spherical Neumann functions [sf.cmath.sph.neumann]

```c
double sph_neumann(unsigned n, double x);
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

**Effects:** These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments \( n \) and \( x \).

**Returns:**
\( n_n(x) = (\pi/2x)^{1/2} N_{n+1/2}(x) \), for \( x \geq 0 \),

where \( n \) is \( n \) and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( n >= 128 \).

See also 26.8.6.10.
26.9 Numbers

26.9.2 Mathematical constants

1 The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of e, log2 e, log10 e, π, 1/π, 1/√π, ln 2, ln 10, √2, √3, 1/√3, the Euler-Mascheroni γ constant, and the golden ratio φ constant 1+√5/2, respectively.

2 Pursuant to 16.5.4.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.

3 A program that instantiates a primary template of a mathematical constant variable template is ill-formed.
27 Time library

27.1 General

This Clause describes the chrono library (27.2) and various C functions (27.14) that provide generally useful
time utilities, as summarized in Table 96.

Table 96: Time library summary

27.3 Cpp17Clock requirements [time.clock.req]

1 A clock is a bundle consisting of a duration, a time_point, and a function now() to get the current time_point. The origin of the clock’s time_point is referred to as the clock’s epoch. A clock shall meet the requirements in Table 97.

2 In Table 97 C1 and C2 denote clock types. t1 and t2 are values returned by C1::now() where the call returning t1 happens before (6.9.2) the call returning t2 and both of these calls occur before C1::time_point::max(). [Note: This means C1 did not wrap around between t1 and t2. —end note]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1::rep</td>
<td>An arithmetic type or a class emulating an arithmetic type</td>
<td>The representation type of C1::duration.</td>
</tr>
<tr>
<td>C1::duration</td>
<td>chrono::duration&lt;C1::rep, C1::period&gt;</td>
<td>The duration type of the clock.</td>
</tr>
<tr>
<td>C1::time_point</td>
<td>chrono::time_point&lt;C1&gt; or chrono::time_point&lt;C2, C1::duration&gt;</td>
<td>The time_point type of the clock. C1 and C2 shall refer to the same epoch.</td>
</tr>
<tr>
<td>C1::is_steady</td>
<td>const bool</td>
<td>true if t1 &lt;= t2 is always true and the time between clock ticks is constant, otherwise false.</td>
</tr>
<tr>
<td>C1::now()</td>
<td>C1::time_point</td>
<td>Returns a time_point object representing the current point in time.</td>
</tr>
</tbody>
</table>

3 [Note: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. —end note]

4 A type TC meets the Cpp17TrivialClock requirements if:

(4.1) TC meets the Cpp17Clock requirements (27.3),

(4.2) the types TC::rep, TC::duration, and TC::time_point meet the Cpp17EqualityComparable (Table 25) and Cpp17LessThanComparable (Table 26) requirements and the requirements of numeric types (26.2). [Note: This means, in particular, that operations on these types will not throw exceptions. —end note]

(4.3) lvalues of the types TC::rep, TC::duration, and TC::time_point are swappable (16.5.3.2),

(4.4) the function TC::now() does not throw exceptions, and

(4.5) the type TC::time_point::clock meets the Cpp17TrivialClock requirements, recursively.

27.4 Time-related traits [time.traits]

27.4.1 treat_as_floating_point [time.traits.is.fp]

template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> {};

1 The duration template uses the treat_as_floating_point trait to help determine if a duration object can be converted to another duration with a different tick period. If treat_as_floating_point_v<Rep> is true, then implicit conversions are allowed among durations. Otherwise, the implicit convertibility depends on the tick periods of the durations. [Note: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If treat_as_floating_point_v<Rep> is false, Rep will be treated as if it behaved like an integral type for the purpose of these conversions. —end note]
27.4.2 duration_values

```cpp
template<class Rep>
struct duration_values {
    public:
        static constexpr Rep zero() noexcept;
        static constexpr Rep min() noexcept;
        static constexpr Rep max() noexcept;
};
```

The `duration` template uses the `duration_values` trait to construct special values of the duration's representation (`Rep`). This is done because the representation might be a class type with behavior which requires some other implementation to return these special values. In that case, the author of that class type should specialize `duration_values` to return the indicated values.

```cpp
static constexpr Rep zero() noexcept;
```

1. Returns: `Rep(0)`. *[Note: `Rep(0)` is specified instead of `Rep()` because `Rep()` may have some other meaning, such as an uninitialized value. — end note]*

2. Remarks: The value returned shall be the additive identity.

```cpp
static constexpr Rep min() noexcept;
```

4. Remarks: The value returned shall compare less than or equal to `zero()`.

```cpp
static constexpr Rep max() noexcept;
```

5. Returns: `numeric_limits<Rep>::max()`.

27.4.3 Specializations of common_type

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
    using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};
```

1. The period of the duration indicated by this specialization of `common_type` is the greatest common divisor of `Period1` and `Period2`. *[Note: This can be computed by forming a ratio of the greatest common divisor of `Period1::num` and `Period2::num` and the least common multiple of `Period1::den` and `Period2::den. — end note]*

2. *[Note: The typedef name `type` is a synonym for the duration with the largest tick period possible where both duration arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations may have round-off errors. — end note]*

```cpp
template<class Clock, class Duration1, class Duration2>
struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
    using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
};
```

3. The common type of two `time_point` types is a `time_point` with the same clock as the two types and the common type of their two durations.

27.4.4 Class template `is_clock`

```cpp
template<class T> struct is_clock;
```

1. `is_clock` is a `Cpp17UnaryTypeTrait` (20.15.1) with a base characteristic of `true_type` if `T` meets the `Cpp17Clock` requirements (27.3), otherwise `false_type`. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the `Cpp17Clock` requirements is unspecified, except that as a minimum a type `T` shall not qualify as a `Cpp17Clock` unless it meets all of the following conditions:
— the qualified-ids `T::rep`, `T::period`, `T::duration`, and `T::time_point` are valid and each denotes a type (13.10.2),
— the expression `T::is_steady` is well-formed when treated as an unevaluated operand,
— the expression `T::now()` is well-formed when treated as an unevaluated operand.

2 The behavior of a program that adds specializations for `is_clock` is undefined.

27.5 Class template `duration`

A `duration` type measures time between two points in time (`time_points`). A `duration` has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template `ratio`.

```cpp
namespace std::chrono {
    template<class Rep, class Period = ratio<1>>
    class duration {
    public:
        using rep = Rep;
        using period = typename Period::type;

        private:
            rep rep_; // exposition only

    public:
        // 27.5.1, construct/copy/destroy
        constexpr duration() = default;
        template<class Rep2>
            constexpr explicit duration(const Rep2& r);
        template<class Rep2, class Period2>
            constexpr duration(const duration<Rep2, Period2>& d);
        ~duration() = default;
        duration& operator=(const duration&);

        // 27.5.2, observer
        constexpr rep count() const;

        // 27.5.3, arithmetic
        constexpr common_type_t<duration> operator+() const;
        constexpr common_type_t<duration> operator-() const;
        constexpr duration& operator++();
        constexpr duration operator++(int);
        constexpr duration& operator--();
        constexpr duration operator--(int);
        constexpr duration& operator+=(const duration& d);
        constexpr duration& operator-=(const duration& d);
        constexpr duration& operator*=(const rep& rhs);
        constexpr duration& operator/=(const rep& rhs);
        constexpr duration& operator%=(const rep& rhs);
        constexpr duration& operator%=(const duration& rhs);

        // 27.5.4, special values
        static constexpr duration zero() noexcept;
        static constexpr duration min() noexcept;
        static constexpr duration max() noexcept;
    };
}
```

2 `Rep` shall be an arithmetic type or a class emulating an arithmetic type. If `duration` is instantiated with a `duration` type as the argument for the template parameter `Rep`, the program is ill-formed.

3 If `Period` is not a specialization of `ratio`, the program is ill-formed. If `Period::num` is not positive, the program is ill-formed.
Members of `duration` do not throw exceptions other than those thrown by the indicated operations on their representations.

The defaulted copy constructor of `duration` shall be a constexpr function if and only if the required initialization of the member `rep_` for copy and move, respectively, would satisfy the requirements for a constexpr function.

```cpp
// Example:
duration<long, ratio<60>> d0; // holds a count of minutes using a long
duration<long long, milli> d1; // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>> d2; // holds a count with a tick period of 1/30 of a second // (30 Hz) using a double
```

### 27.5.1 Constructors

```cpp
template<class Rep2>
constexpr explicit duration(const Rep2& r);
```

**Constraints:**

- `is_convertible_v<const Rep2&, rep>` is true and
- `treat_as_floating_point_v<rep>` is true or
- `treat_as_floating_point_v<Rep2>` is false.

```cpp
// Example:
duration<int, milli> d(3); // OK
duration<int, milli> d(3.5); // error
```

**Postconditions:**

```cpp
count() == static_cast<rep>(r).
```

```cpp
template<class Rep2, class Period2>
constexpr duration(const duration<Rep2, Period2>& d);
```

**Constraints:** No overflow is induced in the conversion and `treat_as_floating_point_v<rep>` is true or both `ratio_divide<Period2, period>::den` is 1 and `treat_as_floating_point_v<Rep2>` is false. [Note: This requirement prevents implicit truncation error when converting between integral-based `duration` types. Such a construction could easily lead to confusion about the value of the `duration`. — end note] [Example:

```cpp
duration<int, milli> ms(3); // OK
duration<int, micro> us = ms; // OK
duration<int, milli> ms2 = us; // error
```

**Effects:** Initializes `rep_` with `duration_cast<duration>(d).count()`.

### 27.5.2 Observer

```cpp
constexpr rep count() const;
```

**Returns:** `rep_`.

### 27.5.3 Arithmetic

```cpp
constexpr common_type_t<duration> operator+() const;
```

**Returns:** `common_type_t<duration>(*this)`.

```cpp
constexpr common_type_t<duration> operator-() const;
```

**Returns:** `common_type_t<duration>(-rep_)`.

```cpp
constexpr duration& operator++();
```

**Effects:** Equivalent to: `++rep_`.

**Returns:** `*this`.
constexpr duration operator++(int);

Effects: Equivalent to: return duration(rep_++);

constexpr duration& operator--();

Effects: Equivalent to: --rep_.
Returns: *this.

constexpr duration operator--(int);

Effects: Equivalent to: return duration(rep_--);

constexpr duration& operator+=(const duration& d);

Effects: Equivalent to: rep_ += d.count().
Returns: *this.

constexpr duration& operator-=(const duration& d);

Effects: Equivalent to: rep_ -= d.count().
Returns: *this.

constexpr duration& operator*=(const rep& rhs);

Effects: Equivalent to: rep_ *= rhs.
Returns: *this.

constexpr duration& operator/=(const rep& rhs);

Effects: Equivalent to: rep_ /= rhs.
Returns: *this.

constexpr duration& operator%=(const rep& rhs);

Effects: Equivalent to: rep_ %= rhs.
Returns: *this.

constexpr duration& operator%=(const duration& rhs);

Effects: Equivalent to: rep_ %= rhs.count().
Returns: *this.

27.5.4 Special values [time.duration.special]

static constexpr duration zero() noexcept;

Returns: duration(duration_values<rep>::zero()).

static constexpr duration min() noexcept;

Returns: duration(duration_values<rep>::min()).

static constexpr duration max() noexcept;

Returns: duration(duration_values<rep>::max()).

27.5.5 Non-member arithmetic [time.duration.nonmember]

In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(CD(lhs).count() + CD(rhs).count()).
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(CD(lhs).count()) - CD(rhs).count()．

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator *(const duration<Rep1, Period>& d, const Rep2& s);

Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true.

Returns: CD(d).count() * s.

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator *(const Rep1& s, const duration<Rep2, Period>& d);

Constraints: is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>> is true.

Returns: d * s.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(lhs).count() / CD(rhs).count()．

27.5.6 Comparisons

In the function descriptions that follow, CT represents common_type_t<A, B>, where A and B are the types of the two arguments to the function.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CT(lhs).count() == CT(rhs).count()．

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CT(lhs).count() < CT(rhs).count()．
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>(const duration<Rep1, Period1>& lhs,
const duration<Rep2, Period2>& rhs);

Returns: rhs < lhs.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<=(const duration<Rep1, Period1>& lhs,
const duration<Rep2, Period2>& rhs);

Returns: !(rhs < lhs).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>=(const duration<Rep1, Period1>& lhs,
const duration<Rep2, Period2>& rhs);

Returns: !(lhs < rhs).

requires three_way_comparable<typename CT::rep>
constexpr auto operator<=>(const duration<Rep1, Period1>& lhs,
const duration<Rep2, Period2>& rhs);

Returns: CT(lhs).count() <=> CT(rhs).count().

27.5.7 Conversions

template<class ToDuration, class Rep, class Period>
constexpr ToDuration duration_cast(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.

Returns: Let CF be ratio_divide<Period, typename ToDuration::period>, and CR be common_type<
type<typename ToDuration::rep, Rep, intmax_t>::type,
— If CF::num == 1 and CF::den == 1, returns
  ToDuration(static_cast<typename ToDuration::rep>(d.count()))
— otherwise, if CF::num != 1 and CF::den == 1, returns
  ToDuration(static_cast<typename ToDuration::rep>(
    static_cast<CR>(d.count()) * static_cast<CR>(CF::num)))
— otherwise, if CF::num == 1 and CF::den != 1, returns
  ToDuration(static_cast<typename ToDuration::rep>(
    static_cast<CR>(d.count()) / static_cast<CR>(CF::den)))
— otherwise, returns
  ToDuration(static_cast<typename ToDuration::rep>(
    static_cast<CR>(d.count()) * static_cast<CR>(CF::num) / static_cast<CR>(CF::den)))

[Note: This function does not use any implicit conversions; all conversions are done with static_cast.
It avoids multiplications and divisions when it is known at compile time that one or more arguments is
1. Intermediate computations are carried out in the widest representation and only converted to the
destination representation at the final step. — end note]

template<class ToDuration, class Rep, class Period>
constexpr ToDuration floor(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.

Returns: The greatest result t representable in ToDuration for which t <= d.

template<class ToDuration, class Rep, class Period>
constexpr ToDuration ceil(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.

Returns: The least result t representable in ToDuration for which t >= d.
```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration round(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration and treat_as_floating_point_v<typename
ToDuration::rep> is false.

Returns: The value of ToDuration that is closest to d. If there are two closest values, then return the
value t for which t % 2 == 0.

27.5.8 Suffixes for duration literals

This subclause describes literal suffixes for constructing duration literals. The suffixes h, min, s, ms, us, ns
denote duration values of the corresponding types hours, minutes, seconds, milliseconds, microseconds, and
nanoseconds respectively if they are applied to integer-literal.

If any of these suffixes are applied to a floating-point-literal the result is a chrono::duration literal with an
unspecified floating-point representation.

If any of these suffixes are applied to an integer-literal and the resulting chrono::duration value cannot be
represented in the result type because of overflow, the program is ill-formed.

[Example: The following code shows some duration literals.
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
—end example]

constexpr chrono::hours operator"h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator"h(long double hours);

Returns: A duration literal representing hours hours.

constexpr chrono::minutes operator"min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator"min(long double minutes);

Returns: A duration literal representing minutes minutes.

constexpr chrono::seconds operator"s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator"s(long double sec);

Returns: A duration literal representing sec seconds.

[Note: The same suffix s is used for basic_string but there is no conflict, since duration suffixes apply
to numbers and string literal suffixes apply to character array literals. —end note]

constexpr chrono::milliseconds operator"ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator"ms(long double msec);

Returns: A duration literal representing msec milliseconds.

constexpr chrono::microseconds operator"us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator"us(long double usec);

Returns: A duration literal representing usec microseconds.

constexpr chrono::nanoseconds operator"ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator"ns(long double nsec);

Returns: A duration literal representing nsec nanoseconds.

27.5.9 Algorithms

template<class Rep, class Period>
constexpr duration<Rep, Period> abs(duration<Rep, Period> d);

Constraints: numeric_limits<Rep>::is_signed is true.

Returns: If d >= d.zero(), return d, otherwise return -d.
```
ISO/IEC JTC1 SC22 WG21 N4860

27.5.10 I/O

template<class charT, class traits, class Rep, class Period>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);

Effects: Inserts the duration d onto the stream os as if it were implemented as follows:

    basic_ostringstream<charT, traits> s;
    s.flags(os.flags());
    s.imbue(os.getloc());
    s.precision(os.precision());
    s << d.count() << units-suffix;
    return os << s.str();

where units-suffix depends on the type Period::type as follows:

1. If Period::type is atto, units-suffix is "as".
2. Otherwise, if Period::type is femto, units-suffix is "fs".
3. Otherwise, if Period::type is pico, units-suffix is "ps".
4. Otherwise, if Period::type is nano, units-suffix is "ns".
5. Otherwise, if Period::type is micro, it is implementation-defined whether units-suffix is "µs" ("\u00b5s\u0073") or "us".
6. Otherwise, if Period::type is milli, units-suffix is "ms".
7. Otherwise, if Period::type is centi, units-suffix is "cs".
8. Otherwise, if Period::type is deci, units-suffix is "ds".
9. Otherwise, if Period::type is ratio<1>, units-suffix is "s".
10. Otherwise, if Period::type is deca, units-suffix is "das".
11. Otherwise, if Period::type is hecto, units-suffix is "hs".
12. Otherwise, if Period::type is kilo, units-suffix is "ks".
13. Otherwise, if Period::type is mega, units-suffix is "Ms".
14. Otherwise, if Period::type is giga, units-suffix is "Gs".
15. Otherwise, if Period::type is tera, units-suffix is "Ts".
16. Otherwise, if Period::type is peta, units-suffix is "Ps".
17. Otherwise, if Period::type is exa, units-suffix is "Es".
18. Otherwise, if Period::type is ratio<60>, units-suffix is "min".
19. Otherwise, if Period::type is ratio<3600>, units-suffix is "h".
20. Otherwise, if Period::type is ratio<86400>, units-suffix is "d".
21. Otherwise, if Period::type::den == 1, units-suffix is "[num]s".
22. Otherwise, units-suffix is "[num/den]s".

In the list above, the use of num and den refer to the static data members of Period::type, which are converted to arrays of charT using a decimal conversion with no leading zeroes.

Returns: os.

template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt, duration<Rep, Period>& d,
                basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the duration d using the format flags given in the NTCTS fmt as specified in 27.13. If the parse parses everything specified by the parsing format flags without error, and yet none of the flags impacts a duration, d will be assigned a zero value. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a
modified variant) is used and successfully parsed, that value will be assigned to *offset if *offset is non-null.

Returns: *is.*

## 27.6 Class template `time_point`

```cpp
template<class Clock, class Duration = typename Clock::duration>
class time_point {
    using clock = Clock;
    using duration = Duration;
    using rep = typename duration::rep;
    using period = typename duration::period;

    private:
        duration d_; // exposition only

    public:
        // 27.6.1, construct
        constexpr time_point();
        constexpr explicit time_point(const duration& d);
        template<class Duration2>
        constexpr time_point(const time_point<clock, Duration2>& t);

        // 27.6.2, observer
        constexpr duration time_since_epoch() const;

        // 27.6.3, arithmetic
        constexpr time_point& operator++();
        constexpr time_point operator++(int);
        constexpr time_point& operator--();
        constexpr time_point operator--(int);
        constexpr time_point& operator+=(const duration& d);
        constexpr time_point& operator-=(const duration& d);

        // 27.6.4, special values
        static constexpr time_point min() noexcept;
        static constexpr time_point max() noexcept;
    }
```

1. Clock shall either meet the Cpp17Clock requirements (27.3) or be the type `local_t`.
2. If Duration is not an instance of duration, the program is ill-formed.

### 27.6.1 Constructors

```cpp
constexpr time_point();

Effects: Initializes *d_ with duration::zero(). Such a time_point object represents the epoch.
```

```cpp
constexpr explicit time_point(const duration& d);
```

2. **Effects:** Initializes *d_ with d. Such a time_point object represents the epoch + d.

```cpp
template<class Duration2>
constexpr time_point(const time_point<clock, Duration2>& t);
```

3. **Constraints:** is_convertible_v<Duration2, duration> is true.

4. **Effects:** Initializes *d_ with t.time_since_epoch().

### 27.6.2 Observer

```cpp
constexpr duration time_since_epoch() const;
```

1. **Returns:** *d_.

§ 27.6.2 ©ISO/IEC 2020 – All rights reserved 1248
27.6.3 Arithmetic

`constexpr time_point& operator++();`

*Effects:* Equivalent to: `++d_`.

*Returns:* `*this`.

`constexpr time_point operator++(int);`

*Effects:* Equivalent to: `return time_point{d_++};`

`constexpr time_point& operator--();`

*Effects:* Equivalent to: `--d_`.

*Returns:* `*this`.

`constexpr time_point operator--(int);`

*Effects:* Equivalent to: `return time_point{d_--};`

`constexpr time_point& operator+=(const duration& d);`

*Effects:* Equivalent to: `d_ += d`.

*Returns:* `*this`.

`constexpr time_point& operator-=(const duration& d);`

*Effects:* Equivalent to: `d_ -= d`.

*Returns:* `*this`.

27.6.4 Special values

`static constexpr time_point min() noexcept;`

*Returns:* `time_point(duration::min())`.

`static constexpr time_point max() noexcept;`

*Returns:* `time_point(duration::max())`.

27.6.5 Non-member arithmetic

`template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);`

*Returns:* `CT(lhs.time_since_epoch() + rhs)`, where `CT` is the type of the return value.

`template<class Rep1, class Period1, class Clock, class Duration2>
constexpr time_point operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);`

*Returns:* `rhs + lhs`.

`template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);`

*Returns:* `CT(lhs.time_since_epoch() - rhs)`, where `CT` is the type of the return value.

`template<class Clock, class Duration1, class Duration2>
constexpr bool operator==(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);`

*Returns:* `lhs.time_since_epoch() == rhs.time_since_epoch()`.

27.6.6 Comparisons
const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() == rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() < rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);

Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);

Returns: !(rhs < lhs).

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);

Returns: !(lhs < rhs).

template<class Clock, class Duration1,
 three_way_comparable_with<Duration1> Duration2>
constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() <=> rhs.time_since_epoch().

27.6.7 Conversions [time.point.cast]

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);

Constraints: ToDuration is a specialization of duration.

Returns:
 time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch())).

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch())).

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration, and treat_as_floating_point_v<typename ToDuration::rep> is false.

Returns: time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch())).

27.7 Clocks [time.clock]

The types defined in this subclause meet the Cpp17TrivialClock requirements (27.3) unless otherwise specified.
27.7.1 Class system_clock

27.7.1.1 Overview

Objects of type `system_clock` represent wall clock time from the system-wide realtime clock. Objects of type `sys_time<Duration>` measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as Unix time. This measure facilitates an efficient mapping between `sys_time` and calendar types (27.8). [Example:

```
sys_seconds{sys_days{1970y/January/1}}.time_since_epoch() is 0s.
sys_seconds{sys_days{2000y/January/1}}.time_since_epoch() is 946'684'800s, which is 10'957 * 86'400s.
```
—end example]
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);
Effects: os << year_month_day(dp).
Returns: os.

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
Effects: Attempts to parse the input stream is into the sys_time tp using the format flags given in
the NTCTS fmt as specified in 27.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.
Returns: is.

27.7.2 Class utc_clock
27.7.2.1 Overview
namespace std::chrono {
    class utc_clock {
    public:
        using rep = a signed arithmetic type;
        using period = ratio<unspecified, unspecified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<utc_clock>;
        static constexpr bool is_steady = unspecified;
        static time_point now();
        static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& t);
        template<class Duration>
        static utc_time<common_type_t<Duration, seconds>>
        from_sys(const sys_time<Duration>& t);
    };
}

In contrast to sys_time, which does not take leap seconds into account, utc_clock and its associated
time_point, utc_time, count time, including leap seconds, since 1970-01-01 00:00:00 UTC. [Note: The
UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one
can add/subtract the constant sys_days{1972y/1/1} - sys_days{1970y/1/1} (63'072'000s) from the
utc_time. — end note] [Example:
clock_cast<utc_clock>(sys_seconds{sys_days{1970y/1/1}}).time_since_epoch() is 0s.
clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch()
is 946'684'822s, which is 10'957 * 86'400s + 22s.
— end example]

utc_clock is not a Cpp17TrivialClock unless the implementation can guarantee that utc_clock::now() does not propagate an exception. [Note: noexcept(from_sys(system_clock::now())) is false. — end note]

27.7.2.2 Member functions
static time_point now();
Returns: from_sys(system_clock::now()), or a more accurate value of utc_time.
template<class Duration>
static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& u);

Returns: A sys_time t, such that from_sys(t) == u if such a mapping exists. Otherwise u represents
a time_point during a positive leap second insertion, the conversion counts that leap second as not
inserted, and the last representable value of sys_time prior to the insertion of the leap second is
returned.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
from_sys(const sys_time<Duration>& t);

Returns: A utc_time u, such that u.time_since_epoch() - t.time_since_epoch() is equal to the
sum of leap seconds that were inserted between t and 1970-01-01. If t is exactly the date of leap second
insertion, then the conversion counts that leap second as inserted.

[Example:
    auto t = sys_days{July/1/2015} - 2ns;
    auto u = utc_clock::from_sys(t);
    assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
    t += 1ns;
    u = utc_clock::from_sys(t);
    assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
    t += 1ns;
    u = utc_clock::from_sys(t);
    assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
    t += 1ns;
    u = utc_clock::from_sys(t);
    assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
— end example]

27.7.2.3 Non-member functions

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);

Effects: Equivalent to:

return os << format("{:%F %T}"), t);

[Example:
    auto t = sys_days{July/1/2015} - 500ms;
    auto u = clock_cast<utc_clock>(t);
    for (auto i = 0; i < 8; ++i, u += 250ms)
        cout << u << " UTC\n";

Produces this output:

2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC
2015-07-01 00:00:00.250 UTC
— end example]

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
Effects: Attempts to parse the input stream is into the utc_time tp using the format flags given in the NTCCTS fmt as specified in 27.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

struct leap_second_info {
    bool is_leap_second;
    seconds elapsed;
};

The type leap_second_info has data members and special members specified above. It has no base classes or members other than those specified.

template<class Duration>
    leap_second_info get_leap_second_info(const utc_time<Duration>& ut);

Returns: A leap_second_info lsi, where lsi.is_leap_second is true if ut is during a positive leap second insertion, and otherwise false. lsi.elapsed is the sum of leap seconds between 1970-01-01 and ut. If lsi.is_leap_second is true, the leap second referred to by ut is included in the sum.

27.7.3 Class tai_clock

27.7.3.1 Overview

The clock tai_clock measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

tai_clock is not a Cpp17TrivialClock unless the implementation can guarantee that tai_clock::now() does not propagate an exception. [Note: noexcept(from_utc(utc_clock::now())) is false. — end note]

27.7.3.2 Member functions

static time_point now();

Returns: from_utc(utc_clock::now()), or a more accurate value of tai_time.
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const tai_time<Duration>& t) noexcept;

Returns:
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s

[Note:
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
—end note]

template<class Duration>
static tai_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>& t) noexcept;

Returns:
tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s

[Note:
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
—end note]

27.7.3.3 Non-member functions

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);

Effects: Equivalent to:
return os << format("{:%F %T}", t);

[Example:
auto st = sys_days{2000y/January/1};
auto tt = clock_cast<tai_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, tt);
Produces this output:
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI
—end example]

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt, tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the tai_time tp using the format flags given in the NTCTS fmt as specified in 27.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

27.7.4 Class gps_clock

27.7.4.1 Overview

namespace std::chrono {
    class gps_clock {
        public:
            using rep = a signed arithmetic type;
            using period = ratio<unspecified, unspecified>;
            using duration = chrono::duration<rep, period>;
    }
}
using time_point = chrono::time_point<gps_clock>;
static constexpr bool is_steady = unspecified;

static time_point now();

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const gps_time<Duration>&) noexcept;
template<class Duration>
static gps_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>&) noexcept;
};

// The clock gps_clock measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds
// are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another
// second with respect to GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1],
// GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds

// gps_clock is not a Cpp17TrivialClock unless the implementation can guarantee that gps_clock::now()
// does not propagate an exception. [Note: noexcept(from_utc(utc_clock::now())) is false. — end note]

27.7.4.2 Member functions

static time_point now();
  Returns: from_utc(utc_clock::now()), or a more accurate value of gps_time.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const gps_time<Duration>& t) noexcept;
  Returns:
  gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s
  [Note:
    315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
    — end note]

template<class Duration>
static gps_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>& t) noexcept;
  Returns:
  gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s
  [Note:
    315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
    — end note]

27.7.4.3 Non-member functions

template<class charT, class traits, class Duration>
operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);
  Effects: Equivalent to:
  return os << format(STATICALLY-WIDEN<charT>("{:%F \%T}\n"), t);
  [Example:
    auto st = sys_days{2000y/January/1};
    auto gt = clock_cast<gps_clock>(st);
    cout << format("{:0:%F \%T \%Z} == {1:%F \%T \%Z}\n", st, gt);
  Produces this output:
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>

basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the gps_time tp using the format flags given in
the NTCTS fmt as specified in 27.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called
and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

27.7.5 Type file_clock
27.7.5.1 Overview

namespace std::chrono {
    using file_clock = see below;
}

file_clock is an alias for a type meeting the Cpp17TrivialClock requirements (27.3), and using a signed arithmetic type for file_clock::rep. file_clock is used to create the time_point system used for file_time_type (29.11). Its epoch is unspecified, and noexcept(file_clock::now()) is true. [Note: The type that file_clock denotes may be in a different namespace than std::chrono, such as std::filesystem. -- end note]

27.7.5.2 Member functions

template<class Duration>
static sys_time<see below>
to_sys(const file_time<Duration>&);

template<class Duration>
static file_time<see below>
from_sys(const sys_time<Duration>&);

or:

template<class Duration>
static utc_time<see below>
to_utc(const file_time<Duration>&);

template<class Duration>
static file_time<see below>
from_utc(const utc_time<Duration>&);

These member functions shall provide time_point conversions consistent with those specified by utc_clock, tai_clock, and gps_clock. The Duration of the resultant time_point is computed from the Duration of the input time_point.

27.7.5.3 Non-member functions

template<class charT, class traits, class Duration>

basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);

Effects: Equivalent to:

    return os << format(STDALLY-WIDEN<charT>("{:%F %T}\"), t);
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the file_time tp using the format flags given
in the NTCTS fmt as specified in 27.13. If the parse fails to decode a valid date, is.setstate(ios base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will
be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully
parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset
will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

27.7.6 Class steady_clock

namespace std::chrono {
    class steady_clock {
        public:
            using rep = unspecified;
            using period = ratio<unspecified, unspecified>;
            using duration = chrono::duration<rep, period>;
            using time_point = chrono::time_point<unspecified, duration>;
            static constexpr bool is_steady = true;

            static time_point now() noexcept;
    };
}

Objects of class steady_clock represent clocks for which values of time_point never decrease as physical
time advances and for which values of time_point advance at a steady rate relative to real time. That is,
the clock may not be adjusted.

27.7.7 Class high_resolution_clock

namespace std::chrono {
    class high_resolution_clock {
        public:
            using rep = unspecified;
            using period = ratio<unspecified, unspecified>;
            using duration = chrono::duration<rep, period>;
            using time_point = chrono::time_point<unspecified, duration>;
            static constexpr bool is_steady = unspecified;

            static time_point now() noexcept;
    };
}

Objects of class high_resolution_clock represent clocks with the shortest tick period. high_resolution_-
clock may be a synonym for system_clock or steady_clock.

27.7.8 Local time

The family of time points denoted by local_time<Duration> are based on the pseudo clock local_t.
local_t has no member now() and thus does not meet the clock requirements. Nevertheless local_-
time<Duration> serves the vital role of representing local time with respect to a not-yet-specified time
zone. Aside from being able to get the current time, the complete time_point algebra is available for
local_time<Duration> (just as for sys_time<Duration>).

template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);

Effects:
    os << sys_time<Duration>{lt.time_since_epoch()};

Returns: os.
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
        from_stream(basic_istream<charT, traits>& is, const charT* fmt, 
        local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr, 
        minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the local_time tp using the format flags given 
in the NTCTS fmt as specified in 27.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) 
is called and tp is not modified. If %Z is used and successfully parsed, that value will 
be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully 
parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

27.7.9 time_point conversions

27.7.9.1 Class template clock_time_conversion

namespace std::chrono {
    template<class DestClock, class SourceClock>
        struct clock_time_conversion {};
}

clock_time_conversion serves as a trait which can be used to specify how to convert a source time_point of 
type time_point<SourceClock, Duration> to a destination time_point of type time_point<DestClock, 
Duration> via a specialization: clock_time_conversion<DestClock, SourceClock>. A specialization 
of clock_time_conversion<DestClock, SourceClock> shall provide a const-qualified operator() that 
takes a parameter of type time_point<SourceClock, Duration> and returns a time_point<DestClock, 
OtherDuration> representing an equivalent point in time. OtherDuration is a chrono::duration whose 
specialization is computed from the input Duration in a manner which can vary for each clock_time_ 
conversion specialization. A program may specialize clock_time_conversion if at least one of the template 
parameters is a user-defined clock type.

Several specializations are provided by the implementation, as described in 27.7.9.2, 27.7.9.3, 27.7.9.4, and 
27.7.9.5.

27.7.9.2 Identity conversions

template<class Clock>
    struct clock_time_conversion<Clock, Clock> {
        template<class Duration>
            time_point<Clock, Duration>
                operator()(const time_point<Clock, Duration>& t) const;
    };

template<class Duration>
    time_point<Clock, Duration>
        operator()(const time_point<Clock, Duration>& t) const;

Returns: t.

template>
    struct clock_time_conversion<system_clock, system_clock> {
        template<class Duration>
            sys_time<Duration>
                operator()(const sys_time<Duration>& t) const;
    };

template<class Duration>
    sys_time<Duration>
        operator()(const sys_time<Duration>& t) const;

Returns: t.

template>
    struct clock_time_conversion<utc_clock, utc_clock> {
        template<class Duration>
            utc_time<Duration>
                operator()(const utc_time<Duration>& t) const;
    };

template<class Duration>
    utc_time<Duration>
        operator()(const utc_time<Duration>& t) const;
template<class Duration>
utc_time<Duration>
operator()(const utc_time<Duration>& t) const;

Returns: t.

27.7.9.3 Conversions between system_clock and utc_clock

template<class Duration>
utc_time<common_type_t<Duration, seconds>>
operator()(const sys_time<Duration>& t) const;

27.7.9.4 Conversions between system_clock and other clocks

template<class SourceClock>
struct clock_time_conversion<system_clock, SourceClock> {
    template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_sys(t));
};

auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_sys(t));

1 Constraints: SourceClock::to_sys(t) is well-formed.
2 Mandates: SourceClock::to_sys(t) returns a sys_time<Duration>, where Duration is a valid
chrono::duration specialization.
3 Returns: SourceClock::to_sys(t).

template<class DestClock>
struct clock_time_conversion<DestClock, system_clock> {
    template<class Duration>
    auto operator()(const sys_time<Duration>& t) const
    -> decltype(DestClock::from_sys(t));
};

auto operator()(const sys_time<Duration>& t) const
    -> decltype(DestClock::from_sys(t));

4 Constraints: DestClock::from_sys(t) is well-formed.
5 Mandates: DestClock::from_sys(t) returns a time_point<DestClock, Duration>, where Duration
is a valid chrono::duration specialization.
6 Returns: DestClock::from_sys(t).
27.7.9.5 Conversions between `utc_clock` and other clocks

```cpp
template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
    template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_utc(t));
};
```

```cpp
template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
-> decltype(SourceClock::to_utc(t));
```

**Constraints:** `SourceClock::to_utc(t)` is well-formed.

**Mandates:** `SourceClock::to_utc(t)` returns a `utc_time<Duration>`, where `Duration` is a valid `chrono::duration` specialization.

**Returns:** `SourceClock::to_utc(t)`.

```cpp
template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
    template<class Duration>
    auto operator()(const utc_time<Duration>& t) const
    -> decltype(DestClock::from_utc(t));
};
```

```cpp
template<class Duration>
auto operator()(const utc_time<Duration>& t) const
-> decltype(DestClock::from_utc(t));
```

**Constraints:** `DestClock::from_utc(t)` is well-formed.

**Mandates:** `DestClock::from_utc(t)` returns a `time_point<DestClock, Duration>`, where `Duration` is a valid `chrono::duration` specialization.

**Returns:** `DestClock::from_utc(t)`.

27.7.9.6 Function template `clock_cast`

```cpp
template<class DestClock, class SourceClock, class Duration>
auto clock_cast(const time_point<SourceClock, Duration>& t);
```

**Constraints:** At least one of the following clock time conversion expressions is well-formed:

1. `clock_time_conversion<DestClock, SourceClock>{t}`
2. `clock_time_conversion<DestClock, system_clock>{(clock_time_conversion<system_clock, SourceClock>{t})}`
3. `clock_time_conversion<DestClock, utc_clock>{(clock_time_conversion<utc_clock, SourceClock>{t})}`
4. `clock_time_conversion<DestClock, utc_clock>{(clock_time_conversion<utc_clock, system_clock>{(clock_time_conversion<system_clock, SourceClock>{t})})}`
5. `clock_time_conversion<DestClock, system_clock>{(clock_time_conversion<system_clock, utc_clock>{(clock_time_conversion<utc_clock, SourceClock>{t})})}`

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer `operator()` calls on `clock_time_conversion` specializations.

**Mandates:** Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.

**Returns:** The best well-formed clock time conversion expression in the above list.

27.8 The civil calendar

27.8.1 In general

The types in 27.8 describe the civil (Gregorian) calendar and its relationship to `sys_days` and `local_days`.
27.8.2 Class last_spec

namespace std::chrono {
    struct last_spec {
        explicit last_spec() = default;
    };
}

The type last_spec is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

27.8.3 Class day

27.8.3.1 Overview

namespace std::chrono {
    class day {
        unsigned char d_;     // exposition only
    public:
        day() = default;
        constexpr explicit day(unsigned d) noexcept;
        constexpr day& operator++() noexcept;
        constexpr day operator++(int) noexcept;
        constexpr day& operator--() noexcept;
        constexpr day operator--(int) noexcept;
        constexpr day& operator+=(const days& d) noexcept;
        constexpr day& operator-=(const days& d) noexcept;
        constexpr explicit operator unsigned() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

day represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any unsigned value, which will be subsequently truncated to fit into day’s unspecified internal storage. day meets the Cpp17EqualityComparable (Table 25) and Cpp17LessThanComparable (Table 26) requirements, and participates in basic arithmetic with days objects, which represent a difference between two day objects.

day is a trivially copyable and standard-layout class type.

27.8.3.2 Member functions

constexpr explicit day(unsigned d) noexcept;

Effects: Initializes d_ with d. The value held is unspecified if d is not in the range [0, 255].

constexpr day& operator++() noexcept;

Effects: ++d_.

Returns: *this.

constexpr day operator++(int) noexcept;

Effects: ++(*this).

Returns: A copy of *this as it existed on entry to this member function.

constexpr day& operator--() noexcept;

Effects: Equivalent to: --d_.

Returns: *this.

constexpr day operator--(int) noexcept;

Effects: --(*this).

Returns: A copy of *this as it existed on entry to this member function.
constexpr day& operator+=(const days& d) noexcept;

Effects: *this = *this + d.

Returns: *this.

constexpr day& operator-=(const days& d) noexcept;

Effects: *this = *this - d.

Returns: *this.

constexpr explicit operator unsigned() const noexcept;

Returns: d_.

constexpr bool ok() const noexcept;

Returns: 1 <= d_ && d_ <= 31.

27.8.3.3 Non-member functions [time.cal.day.nonmembers]

constexpr bool operator==(const day& x, const day& y) noexcept;

Returns: unsigned{x} == unsigned{y}.

constexpr strong_ordering operator<=>(const day& x, const day& y) noexcept;

Returns: unsigned{x} <=> unsigned{y}.

constexpr day operator+(const day& x, const days& y) noexcept;

Returns: y + x.

constexpr day operator+(const days& x, const day& y) noexcept;

Returns: day(unsigned{x} + y.count()).

constexpr day operator-(const day& x, const days& y) noexcept;

Returns: x + -y.

constexpr days operator-(const day& x, const day& y) noexcept;

Returns: days{int(unsigned{x}) - int(unsigned{y})}.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const day& d);

Effects: Equivalent to:

return os << (d.ok() ?
    format("{:%d}", d) :
    format("{:%d} is not a valid day"), d));

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    day& d, basic_string<charT, traits, Alloc>* abbrev = nullptr,
    minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the day d using the format flags given in the NTCTS fmt as specified in 27.13. If the parse fails to decode a valid day, is.setstate(ios_base::failbit) is called and d is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

constexpr chrono::day operator""d(unsigned long long d) noexcept;

Returns: day{static_cast(unsigned)(d)}. 

§ 27.8.3.3 ©ISO/IEC 2020 – All rights reserved 1263
27.8.4 Class month

27.8.4.1 Overview

namespace std::chrono {
    class month {
        unsigned char m_; // exposition only
    public:
        month() = default;
        constexpr explicit month(unsigned m) noexcept;
        constexpr month& operator++() noexcept;
        constexpr month operator++(int) noexcept;
        constexpr month& operator--() noexcept;
        constexpr month operator--(int) noexcept;
        constexpr month& operator+=(const months& m) noexcept;
        constexpr month& operator-=(const months& m) noexcept;
        constexpr explicit operator unsigned() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

1 month represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any unsigned value, which will be subsequently truncated to fit into month’s unspecified internal storage. month meets the Cpp17EqualityComparable (Table 25) and Cpp17LessThanComparable (Table 26) requirements, and participates in basic arithmetic with months objects, which represent a difference between two month objects.

2 month is a trivially copyable and standard-layout class type.

27.8.4.2 Member functions

constexpr explicit month(unsigned m) noexcept;

1 Effects: Initializes m_ with m. The value held is unspecified if m is not in the range [0, 255].

constexpr month& operator++() noexcept;

2 Effects: *this += months{1}.
3 Returns: *this.

constexpr month operator++(int) noexcept;

4 Effects: ++(*this).
5 Returns: A copy of *this as it existed on entry to this member function.

constexpr month& operator--() noexcept;

6 Effects: *this -= months{1}.
7 Returns: *this.

constexpr month operator--(int) noexcept;

8 Effects: --(*this).
9 Returns: A copy of *this as it existed on entry to this member function.

constexpr month& operator+=(const months& m) noexcept;

10 Effects: *this = *this + m.
11 Returns: *this.

constexpr month& operator-=(const months& m) noexcept;

12 Effects: *this = *this - m.
13 Returns: *this.
constexpr explicit operator unsigned() const noexcept;

    Returns: \( m_\).

cconstexpr bool ok() const noexcept;

    Returns: \( 1 \leq m_ \&\& m_ \leq 12 \).

### 27.8.4.3 Non-member functions

```cpp
constexpr bool operator==(const month& x, const month& y) noexcept;

    Returns: unsigned\{x\} == unsigned\{y\}.

constexpr strong_ordering operator<=>(const month& x, const month& y) noexcept;

    Returns: unsigned\{x\} <=> unsigned\{y\}.
```

```cpp
constexpr month operator+(const month& x, const months& y) noexcept;

    Returns:
```

```cpp
month\{modulo(static_cast<long long>(unsigned\{x\}) + (y.count() - 1), 12) + 1\} 
```

where \( \text{modulo}(n, 12) \) computes the remainder of \( n \) divided by 12 using Euclidean division. [Note: Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of \([0, 11]\). Assuming no overflow in the signed summation, this operation results in a \( \text{month} \) holding a value in the range \([1, 12]\) even if \!x.ok(). —end note] [Example: February + months\{11\} == January. —end example]

```cpp
constexpr month operator+(const months& x, const month& y) noexcept;

    Returns: \( y + x \).
```

```cpp
constexpr month operator-(const month& x, const months& y) noexcept;

    Returns: \( x + -y \).
```

```cpp
constexpr months operator-(const month& x, const month& y) noexcept;

    Returns: If \( x.ok() == true \) and \( y.ok() == true \), returns a value \( m \) in the range \([\text{months\{0\}}, \text{months\{11\}}]\) satisfying \( y + m == x \). Otherwise the value returned is unspecified. [Example: January - February == months\{11\}. —end example]
```

```cpp
template<class charT, class traits>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const month& m);
```

```cpp
Effects: Equivalent to:
```
```cpp
    return os << (m.ok() ?
        format(os.getloc(), STATICALLY-WIDEN<charT>("{:%b}"), m) :
        format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid month"),
            static_cast<unsigned>(m))) ;
```

```cpp
template<class charT, class traits, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
        from_stream(basic_istream<charT, traits>& is, const charT* fmt, 
            months m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

```cpp
Effects: Attempts to parse the input stream \( \text{is} \) into the \( \text{month} \ \text{m} \) using the format flags given in the NTCTS \( \text{fmt} \) as specified in 27.13. If the parse fails to decode a valid month, \( \text{is.setstate}(\text{ios_base::failbit}) \) is called and \( \text{m} \) is not modified. If \%Z is used and successfully parsed, that value will be assigned to \*abbrev if \abbrev is non-null. If \%z (or a modified variant) is used and successfully parsed, that value will be assigned to \*offset if \offset is non-null. 
```

```cpp
Returns: \text{is}.
```

### 27.8.5 Class \text{year}

#### 27.8.5.1 Overview

```cpp
namespace std::chrono {
```
class year {
    short y_; // exposition only
public:
    year() = default;
    constexpr explicit year(int y) noexcept;
    constexpr year& operator++() noexcept;
    constexpr year operator++(int) noexcept;
    constexpr year& operator--() noexcept;
    constexpr year operator--(int) noexcept;
    constexpr year& operator+=(const years& y) noexcept;
    constexpr year& operator-=(const years& y) noexcept;
    constexpr year operator+() const noexcept;
    constexpr year operator-() const noexcept;
    constexpr bool is_leap() const noexcept;
    constexpr explicit operator int() const noexcept;
    constexpr bool ok() const noexcept;
    static constexpr year min() noexcept;
    static constexpr year max() noexcept;
};

1 year represents a year in the civil calendar. It can represent values in the range \([\text{min()}, \text{max()}]\). It can be constructed with any \text{int} value, which will be subsequently truncated to fit into year's unspecified internal storage. year meets the Cpp17EqualityComparable (Table 25) and Cpp17LessThanComparable (Table 26) requirements, and participates in basic arithmetic with years objects, which represent a difference between two year objects.

2 year is a trivially copyable and standard-layout class type.

27.8.5.2 Member functions

constexpr explicit year(int y) noexcept;

1 Effects: Initializes \(y_\) with \(y\). The value held is unspecified if \(y\) is not in the range \([-32767, 32767]\).

constexpr year& operator++() noexcept;

2 Effects: \(++y_\).
3 Returns: *this.

constexpr year operator++(int) noexcept;

4 Effects: \((++(\text{this})\).
5 Returns: A copy of *this as it existed on entry to this member function.

constexpr year& operator--() noexcept;

6 Effects: \(--y_\).
7 Returns: *this.

constexpr year operator--(int) noexcept;

8 Effects: \(-(\text{this})\).
9 Returns: A copy of *this as it existed on entry to this member function.

constexpr year& operator+=(const years& y) noexcept;

10 Effects: *this = *this + y.
11 Returns: *this.
constexpr year& operator-=(const years& y) noexcept;
12 Effects: *this = *this - y.
13 Returns: *this.

constexpr year operator+() const noexcept;
14 Returns: *this.

constexpr year::operator-() const noexcept;
15 Returns: year{-y_}.

constexpr bool is_leap() const noexcept;
16 Returns: y_ % 4 == 0 && (y_ % 100 != 0 || y_ % 400 == 0).

constexpr explicit operator int() const noexcept;
17 Returns: y_.

constexpr bool ok() const noexcept;
18 Returns: min().y_ <= y_ && y_ <= max().y_.

static constexpr year min() noexcept;
19 Returns: year{-32767}.

static constexpr year max() noexcept;
20 Returns: year{32767}.

27.8.5.3 Non-member functions [time.cal.year.nonmembers]

constexpr bool operator==(const year& x, const year& y) noexcept;
1 Returns: int{x} == int{y}.

constexpr strong_ordering operator<=>(const year& x, const year& y) noexcept;
2 Returns: int{x} <=> int{y}.

constexpr year operator+(const year& x, const years& y) noexcept;
3 Returns: year{int{x} + y.count()}.

constexpr year operator+(const years& x, const year& y) noexcept;
4 Returns: y + x.

constexpr year operator-(const year& x, const years& y) noexcept;
5 Returns: x + -y.

constexpr years operator-(const year& x, const year& y) noexcept;
6 Returns: years{int{x} - int{y}}.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year& y);
7 Effects: Equivalent to:
    return os << (y.ok() ?
        format(STATICALLY-WIDEN<charT>("{:Y}"), y) :
        format(STATICALLY-WIDEN<charT>("{:Y} is not a valid year"), y));

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
8
Effects: Attempts to parse the input stream is into the year y using the format flags given in the NTCTS
fmt as specified in 27.13. If the parse fails to decode a valid year, is.setstate(ios_base::failbit)
is called and y is not modified. If %Z is used and successfully parsed, that value will be assigned to
*abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value
will be assigned to *offset if offset is non-null.

9
Returns: is.

cconstexpr chrono::year operator"y(unsigned long long y) noexcept;

10
Returns: year{static_cast<int>(y)}.

27.8.6 Class weekday

27.8.6.1 Overview

namespace std::chrono {
    class weekday {
        unsigned char wd_; // exposition only
    public:
        weekday() = default;
       constexpr explicit weekday(unsigned wd) noexcept;
       constexpr weekday(const sys_days& dp) noexcept;
       constexpr explicit weekday(const local_days& dp) noexcept;
        constexpr weekday& operator++() noexcept;
        constexpr weekday operator++(int) noexcept;
        constexpr weekday& operator--() noexcept;
        constexpr weekday operator--(int) noexcept;
        constexpr weekday& operator+=(const days& d) noexcept;
        constexpr weekday& operator-=(const days& d) noexcept;
        constexpr unsigned c_encoding() const noexcept;
        constexpr unsigned iso_encoding() const noexcept;
        constexpr bool ok() const noexcept;
        constexpr weekday_indexed operator[](unsigned index) const noexcept;
        constexpr weekday_last operator[](last_spec) const noexcept;
    };
}

1 weekday represents a day of the week in the civil calendar. It normally holds values in the range 0 to 6,
corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be
constructed with any unsigned value, which will be subsequently truncated to fit into weekday’s unspecified
internal storage. weekday meets the Cpp17EqualityComparable (Table 25) requirements. [Note: weekday is
not Cpp17LessThanComparable because there is no universal consensus on which day is the first day of the
week. weekday’s arithmetic operations treat the days of the week as a circular range, with no beginning and
no end. — end note]

2 weekday is a trivially copyable and standard-layout class type.

27.8.6.2 Member functions

constexpr explicit weekday(unsigned wd) noexcept;

1 Effects: Initializes wd_ with wd == 7 ? 0 : wd. The value held is unspecified if wd is not in the range
[0, 255].

cconstexpr weekday(const sys_days& dp) noexcept;

2 Effects: Computes what day of the week corresponds to the sys_days dp, and initializes that day of
the week in wd_.

3 [Example: If dp represents 1970-01-01, the constructed weekday represents Thursday by storing 4 in
wd_. — end example]
constexpr explicit weekday(const local_days& dp) noexcept;
 Effects: Computes what day of the week corresponds to the local_days dp, and initializes that day of the week in wd_.
 Postconditions: The value is identical to that constructed from sys_days(dp.time_since_epoch()).

constexpr weekday& operator++() noexcept;
 Effects: *this += days{1}.
 Returns: *this.

constexpr weekday operator++(int) noexcept;
 Effects: ++(*this).
 Returns: A copy of *this as it existed on entry to this member function.

constexpr weekday& operator--() noexcept;
 Effects: *this -= days{1}.
 Returns: *this.

constexpr weekday operator--(int) noexcept;
 Effects: --(*this).
 Returns: A copy of *this as it existed on entry to this member function.

constexpr weekday& operator+=(const days& d) noexcept;
 Effects: *this = *this + d.
 Returns: *this.

constexpr weekday& operator-=(const days& d) noexcept;
 Effects: *this = *this - d.
 Returns: *this.

constexpr unsigned c_encoding() const noexcept;
 Returns: wd_.

constexpr unsigned iso_encoding() const noexcept;
 Returns: wd_ == 0u ? 7u : wd_.

constexpr bool ok() const noexcept;
 Returns: wd_ <= 6.

constexpr weekday_indexed operator[](unsigned index) const noexcept;
 Returns: {*this, index}.

constexpr weekday_last operator[](last_spec) const noexcept;
 Returns: weekday_last{*this}.

27.8.6.3 Non-member functions

constexpr bool operator==(const weekday& x, const weekday& y) noexcept;
 Returns: x.wd_ == y.wd_.

constexpr weekday operator+(const weekday& x, const days& y) noexcept;
 Returns: weekday{modulo(static_cast<long long>(x.wd_ + y.count()), 7)}
 where modulo(n, 7) computes the remainder of n divided by 7 using Euclidean division. [Note: Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0, 6]. Assuming no overflow in the signed summation, this operation results in a
weekday holding a value in the range \([0, 6]\) even if \(!x.ok()\). —end note  [Example: Monday + days\(\{6\}\) == Sunday. —end example]

constexpr weekday operator+(const days& x, const weekday& y) noexcept;

Returns: \(y + x\).

constexpr weekday operator-(const weekday& x, const days& y) noexcept;

Returns: \(x + -y\).

constexpr days operator-(const weekday& x, const weekday& y) noexcept;

Returns: If \(x.ok() == true\) and \(y.ok() == true\), returns a value \(d\) in the range \([\text{days}\{0\}, \text{days}\{6\}]\) satisfying \(y + d == x\). Otherwise the value returned is unspecified. [Example: Sunday - Monday == days\(\{6\}\). —end example]

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday& wd);

Effects: Equivalent to:

\[
\text{return os } \ll \begin{cases}
\text{(wd.ok()) ? } & \text{format(os.getloc(), \text{STATICALLY-WIDEN}<\text{charT}>("{:%a}\"), wd)} \\
\text{false} & \text{format(os.getloc(), \text{STATICALLY-WIDEN}<\text{charT}>("{} is not a valid weekday"), static_cast<unsigned>(wd.wd_)))}
\end{cases}
\]

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt, weekday& wd, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);

Effects: Attempts to parse the input stream \(\text{is}\) into the \text{weekday \(\text{wd}\)} using the format flags given in the NTCTS \(\text{fmt}\) as specified in 27.13. If the parse fails to decode a valid weekday, \(\text{is.setstate(ios_-base::failbit)}\) is called and \(\text{wd}\) is not modified. If \%Z is used and successfully parsed, that value will be assigned to \(*\text{abbrev}\) if \(\text{abbrev}\) is non-null. If \%z (or a modified variant) is used and successfully parsed, that value will be assigned to \(*\text{offset}\) if \(\text{offset}\) is non-null.

Returns: \(\text{is}\).

27.8.7 Class weekday_indexed

27.8.7.1 Overview

namespace std::chrono {

    class weekday_indexed {
        chrono::weekday \(\text{wd};\) // exposition only
        unsigned char \(\text{index}_;\) // exposition only

    public:
        weekday_indexed() = default;
        constexpr weekday_indexed(const chrono::weekday& \(\text{wd}\), unsigned \(\text{index}\)) noexcept;

        constexpr chrono::weekday weekday() const noexcept;
        constexpr unsigned index() const noexcept;
        constexpr bool ok() const noexcept;
    };

} [time.cal.wdidx]

weekday_indexed represents a weekday and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

[Note: A weekday_indexed object can be constructed by indexing a weekday with an unsigned. —end note]  [Example:

castexpr auto wd = Sunday[2]; // \(\text{wd}\) is the second Sunday of an as yet unspecified month
static_assert(wd.weekday() == Sunday);
static_assert(wd.index() == 2);

§ 27.8.7.1 ©ISO/IEC 2020 – All rights reserved 1270
weekday_indexed is a trivially copyable and standard-layout class type.

27.8.7.2 Member functions

constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;

Effects: Initializes \( \text{wd}_\) with \( \text{wd} \) and \( \text{index}_\) with \( \text{index} \). The values held are unspecified if \(!\text{wd}.\text{ok}()\) or \(\text{index}\) is not in the range \([0, 7]\).

constexpr chrono::weekday weekday() const noexcept;

Returns: \( \text{wd}_\).

constexpr unsigned index() const noexcept;

Returns: \( \text{index}_\).

constexpr bool ok() const noexcept;

Returns: \( \text{wd}_\).\text{ok}() && 1 <= \text{index}_ && \text{index}_ <= 5.

27.8.7.3 Non-member functions

constexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;

Returns: \( x.\text{weekday}() == y.\text{weekday}() && x.\text{index}() == y.\text{index}() \).

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);

Effects: Equivalent to:

auto \( i = \text{wdi}.\text{index}() \);
return os \(<\ (i >= 1 && i <= 5 \) ?
format(os.getloc(), \text{STATICALLY-WIDEN} charT("{}[{}]"), wdi.\text{weekday}(), i) :
format(os.getloc(), \text{STATICALLY-WIDEN} charT("{}[{} is not a valid index]"),
wdi.\text{weekday}(), i));

27.8.8 Class weekday_last

27.8.8.1 Overview

namespace std::chrono {
    class weekday_last {
    chrono::weekday wd_; // exposition only

    public:
        constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;

        constexpr chrono::weekday weekday() const noexcept;
        constexpr bool ok() const noexcept;
   
    };}

weekday_last represents the last weekday of a month.

[Note: A weekday_last object can be constructed by indexing a weekday with last. — end note] [Example: 
constexpr auto \( \text{wdl} = \text{Sunday}[\text{last}] \); // \text{wdl} is the last Sunday of an as yet unspecified month
— end example]

weekday_last is a trivially copyable and standard-layout class type.

27.8.8.2 Member functions

constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;

Effects: Initializes \( \text{wd}_\) with \( \text{wd} \).
constexpr chrono::weekday weekday() const noexcept;

Returns: \( \text{wd}_\).\n
constexpr bool ok() const noexcept;

Returns: \( \text{wd}_\).ok()\.\n
27.8.8.3 Non-member functions

constexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;

Returns: \( x.\text{weekday}() == y.\text{weekday}() \).\n
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);

Effects: Equivalent to:
\[
\text{return os << format(os.getloc(), \text{STATICALLY-\textsc{widen}}<\text{charT}>("\{\text{\texttt{last}}\}\), wdl.\text{weekday}());}
\]

27.8.9 Class month_day

27.8.9.1 Overview

namespace std::chrono {
    class month_day {
        chrono::month m_; // exposition only
        chrono::day d_; // exposition only
    public:
        month_day() = default;
        constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::day day() const noexcept;
        constexpr bool ok() const noexcept;
    }
}

\text{\texttt{month_day}} represents a specific day of a specific month, but with an unspecified year. \text{\texttt{month_day}} meets the Cpp17EqualityComparable (Table 25) and Cpp17LessThanComparable (Table 26) requirements.\n
\text{\texttt{month_day}} is a trivially copyable and standard-layout class type.\n
27.8.9.2 Member functions

constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;

Effects: Initializes \( \text{m}_\) with \( m \) and \( \text{d}_\) with \( d \).

constexpr chrono::month month() const noexcept;

Returns: \( \text{m}_\).

constexpr chrono::day day() const noexcept;

Returns: \( \text{d}_\).

constexpr bool ok() const noexcept;

Returns: \( \text{\texttt{true}} \) if \( \text{m}_\).ok() is \texttt{true}, \( 1d <= \text{d}_\), and \( \text{d}_\) is less than or equal to the number of days in month \( \text{m}_\); otherwise returns \texttt{false}. When \( \text{m}_\) == \text{February}, the number of days is considered to be 29.\n
27.8.9.3 Non-member functions

constexpr bool operator==(const month_day& x, const month_day& y) noexcept;

Returns: \( x.\text{month}() == y.\text{month}() \&\& x.\text{day}() == y.\text{day}() \).
constexpr strong_ordering operator<=>(const month_day& x, const month_day& y) noexcept;

Effects: Equivalent to:

\[
\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{
constexpr strong_ordering operator<=>(const month_day_last& x, const month_day_last& y) noexcept;

Returns: x.month() <=> y.month().

template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);

Effects: Equivalent to:
    return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/last"), mdl.month());

### 27.8.11 Class month_weekday

#### 27.8.11.1 Overview

namespace std::chrono {
    class month_weekday {
        chrono::month m_;  // exposition only
        chrono::weekday_indexed wdi_;  // exposition only
    public:
        constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

        constexpr month_weekday(const chronos::month& m, const chronos::weekday_indexed& wdi) noexcept;

        constexpr month() const noexcept;

        constexpr weekday_indexed() const noexcept;

        constexpr bool ok() const noexcept;
    };
}

1. month_weekday represents the \(n\)th weekday of a month, of an as yet unspecified year. To do this the month_weekday stores a month and a weekday_indexed.

2. [Example:
    ```
    constexpr auto mwd = February/Tuesday[3];  // mwd is the third Tuesday of February of an as yet unspecified year
    static_assert(mwd.month() == February);
    static_assert(mwd.weekday_indexed() == Tuesday[3]);
    ```
    — end example]

3. month_weekday is a trivially copyable and standard-layout class type.

#### 27.8.11.2 Member functions

1. constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;
   
   Effects: Initializes \(m_\) with \(m\), and \(wdi_\) with \(wdi\).

2. constexpr month() const noexcept;
   
   Returns: \(m_\).

3. constexpr weekday_indexed() const noexcept;
   
   Returns: \(wdi_\).

4. constexpr bool ok() const noexcept;
   
   Returns: \(m_.ok() \&\& wdi_.ok()\).

#### 27.8.11.3 Non-member functions

1. constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
   
   Returns: \(x.month() == y.month() \&\& x.weekday_indexed() == y.weekday_indexed()\).

2. template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday& mdl);

   Effects: Equivalent to:
       return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}"), mdl.month(), mdl.weekday_indexed());
27.8.12 Class month_weekday_last

27.8.12.1 Overview

namespace std::chrono {
  class month_weekday_last {
    chrono::month m_;        // exposition only
    chrono::weekday_last wdl_; // exposition only

    public:
    constexpr month_weekday_last(const chrono::month& m,  // exposition only
                                  const chrono::weekday_last& wdl) noexcept;

    constexpr month_weekday_last(month, weekday_last&) const noexcept;

    constexpr month month() const noexcept;

    constexpr weekday_last weekday_last() const noexcept;

    constexpr bool ok() const noexcept;
  };
}

month_weekday_last represents the last weekday of a month, of an as yet unspecified
year. To do this the month_weekday_last stores a month and a weekday_last.

[Example:
  constexpr auto mwd = February/Tuesday[last]; // mwd is the last Tuesday of February of an as yet unspecified year
  static_assert(mwd.month() == February);
  static_assert(mwd.weekday_last() == Tuesday[last]);
  —end example]

month_weekday_last is a trivially copyable and standard-layout class type.

27.8.12.2 Member functions

constexpr month_weekday_last(const chrono::month& m,  // exposition only
                             const chrono::weekday_last& wdl) noexcept;

  Effects: Initializes m_ with m, and wdl_ with wdl.

constexpr chrono::month month() const noexcept;

  Returns: m_.

constexpr chrono::weekday_last weekday_last() const noexcept;

  Returns: wdl_.

constexpr bool ok() const noexcept;

  Returns: m_.ok() && wdl_.ok().

27.8.12.3 Non-member functions

constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;

  Returns: x.month() == y.month() && x.weekday_last() == y.weekday_last().

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);

  Effects: Equivalent to:
           return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}"),
                                mwdl.month(), mwdl.weekday_last());

27.8.13 Class year_month

27.8.13.1 Overview

namespace std::chrono {
  class year_month {
    chrono::year y_;        // exposition only
    chrono::month m_;        // exposition only
  };
}
year_month represents a specific month of a specific year, but with an unspecified day. `year_month` is a field-based time point with a resolution of `months`. `year_month` meets the `Cpp17EqualityComparable` (Table 25) and `Cpp17LessThanComparable` (Table 26) requirements.

`year_month` is a trivially copyable and standard-layout class type.

### 27.8.13.2 Member functions

```cpp
constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;
Effects: Initializes `y_` with `y`, and `m_` with `m`.
Returns: `y_`.

constexpr chrono::year year() const noexcept;
Returns: `y_`.

constexpr chrono::month month() const noexcept;
Returns: `m_`.

constexpr year_month& operator+=(const months& dm) noexcept;
Constraints: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.3.2).
Effects: `*this = *this + dm`.
Returns: `*this`.

constexpr year_month& operator-=(const months& dm) noexcept;
Constraints: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.3.2).
Effects: `*this = *this - dm`.
Returns: `*this`.

constexpr year_month& operator+=(const years& dy) noexcept;
Effects: `*this = *this + dy`.
Returns: `*this`.

constexpr year_month& operator-=(const years& dy) noexcept;
Effects: `*this = *this - dy`.
Returns: `*this`.

constexpr bool ok() const noexcept;
Returns: `y_.ok() && m_.ok()`.
```

### 27.8.13.3 Non-member functions

```cpp
constexpr bool operator==(const year_month& x, const year_month& y) noexcept;
Returns: `x.year() == y.year() && x.month() == y.month()`.
```
constexpr strong_ordering operator<=>(const year_month& x, const year_month& y) noexcept;

Effects: Equivalent to:

if (auto c = x.year() <=> y.year(); c != 0) return c;
return x.month() <=> y.month();

constexpr year_month operator+(const year_month& ym, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: A year_month value z such that z.ok() && z - ym == dm is true.

Complexity: Θ(1) with respect to the value of dm.

constexpr year_month operator+(const months& dm, const year_month& ym) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: ym + dm.

constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: ym + -dm.

constexpr months operator-(const year_month& x, const year_month& y) noexcept;

Returns:

x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) - static_cast<int>(unsigned{y.month()})}

constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;

Returns: (ym.year() + dy) / ym.month().

constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;

Returns: ym + dy.

constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;

Returns: ym + -dy.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month& ym);

Effects: Equivalent to:

return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}"),
ym.year(), ym.month());

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt, 
year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year_month ym using the format flags given in the NTCTS fmt as specified in 27.13. If the parse fails to decode a valid year_month, is.setstate(ios_base::failbit) is called and ym is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.
27.8.14 Class year_month_day

27.8.14.1 Overview

namespace std::chrono {
    class year_month_day {
        chrono::year y_;  // exposition only
        chrono::month m_;  // exposition only
        chrono::day d_;    // exposition only

    public:
        year_month_day() = default;
        constexpr year_month_day(const chrono::year& y, const chrono::month& m, const chrono::day& d) noexcept;
        constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
        constexpr year_month_day(const sys_days& dp) noexcept;
        constexpr explicit year_month_day(const local_days& dp) noexcept;
        constexpr year_month_day& operator+=(const months& m) noexcept;
        constexpr year_month_day& operator-=(const months& m) noexcept;
        constexpr year_month_day& operator+=(const years& y) noexcept;
        constexpr year_month_day& operator-=(const years& y) noexcept;
        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::day day() const noexcept;
        constexpr operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

1 year_month_day represents a specific year, month, and day. year_month_day is a field-based time point with a resolution of days. [Note: year_month_day supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. —end note] year_month_day meets the Cpp17EqualityComparable (Table 25) and Cpp17LessThanComparable (Table 26) requirements.

2 year_month_day is a trivially copyable and standard-layout class type.

27.8.14.2 Member functions

constexpr year_month_day(const chrono::year& y, const chrono::month& m, const chrono::day& d) noexcept;

1 Effects: Initializes y_ with y, m_ with m, and d_ with d.

constexpr year_month_day(const year_month_day_last& ymdl) noexcept;

2 Effects: Initializes y_ with ymdl.year(), m_ with ymdl.month(), and d_ with ymdl.day(). [Note: This conversion from year_month_day_last to year_month_day may be more efficient than converting a year_month_day_last to a sys_days, and then converting that sys_days to a year_month_day. —end note]

constexpr year_month_day(const sys_days& dp) noexcept;

3 Effects: Constructs an object of type year_month_day that corresponds to the date represented by dp.

4 Remarks: For any value ymd of type year_month_day for which ymd.ok() is true, ymd == year_month_day{sys_days{ymd}} is true.

constexpr explicit year_month_day(const local_days& dp) noexcept;

5 Effects: Equivalent to constructing with sys_days{dp.time_since_epoch()}.

constexpr year_month_day& operator+=(const months& m) noexcept;

6 Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).
Effects: \(*this = *this + m.\)
Returns: \(*this.\)

```cpp
constexpr year_month_day& operator-=(const months& m) noexcept;
```

Constraints: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.3.2).

Effects: \(*this = *this - m.\)
Returns: \(*this.\)

```cpp
constexpr year_month_day& operator+=(const years& y) noexcept;
```

Effects: \(*this = *this + y.\)
Returns: \(*this.\)

```cpp
constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;
```

Effects: \(*this = *this - y.\)
Returns: \(*this.\)

```cpp
constexpr chrono::year year() const noexcept;
```

Returns: `y_`

```cpp
constexpr chrono::month month() const noexcept;
```

Returns: `m_`

```cpp
constexpr chrono::day day() const noexcept;
```

Returns: `d_`

```cpp
constexpr explicit operator local_days() const noexcept;
```

Returns: `local_days{sys_days{*this}.time_since_epoch()}`

```cpp
constexpr bool ok() const noexcept;
```

Returns: If `y_.ok()` is true, and `m_.ok()` is true, and `d_` is in the range `[1d, (y_/m_/last).day()]`, then returns `true`; otherwise returns `false`.

27.8.14.3 Non-member functions

```cpp
constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;
```

Returns: `x.year() == y.year() && x.month() == y.month() && x.day() == y.day()`

```cpp
constexpr strong_ordering operator<=>(const year_month_day& x, const year_month_day& y) noexcept;
```

Effects: Equivalent to:

```cpp
if (auto c = x.year() <=> y.year(); c != 0) return c;
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();
```
constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: (ymd.year() / ymd.month() + dm) / ymd.day().

[Note: If ymd.day() is in the range [1d, 28d], ok() will return true for the resultant year_month_day. — end note]

constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: ymd + dm.

constexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: ymd + (-dm).

constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;

Returns: (ymd.year() + dy) / ymd.month() / ymd.day().

[Note: If ymd.month() is February and ymd.day() is not in the range [1d, 28d], ok() may return false for the resultant year_month_day. — end note]

constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;

Returns: ymd + dy.

constexpr year_month_day operator-(const year_month_day& ymd, const years& dy) noexcept;

Returns: ymd + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);

Effects: Equivalent to:
return os << (ymd.ok() ?
format(STATICALLY-WIDEN<charT>("{:%F}"), ymd) :
format(STATICALLY-WIDEN<charT>("{:%F} is not a valid date"), ymd));

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt, 
year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr, 
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year_month_day ymd using the format flags given in the NTCTS fmt as specified in 27.13. If the parse fails to decode a valid year_month_day, is.setstate(ios_base::failbit) is called and ymd is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

27.8.15 Class year_month_day_last

27.8.15.1 Overview
public:
constexpr year_month_day_last(const chrono::year& y,
 const chrono::month_day_last& mdl) noexcept;
constexpr year_month_day_last& operator+=(const months& m) noexcept;
constexpr year_month_day_last& operator-=(const months& m) noexcept;
constexpr year_month_day_last& operator+=(const years& y) noexcept;
constexpr year_month_day_last& operator-=(const years& y) noexcept;
constexpr chrono::year year() const noexcept;
constexpr chrono::month month() const noexcept;
constexpr chrono::month_day_last month_day_last() const noexcept;
constexpr chrono::day day() const noexcept;
constexpr operator sys_days() const noexcept;
constexpr explicit operator local_days() const noexcept;
constexpr bool ok() const noexcept;
};

1 year_month_day_last represents the last day of a specific year and month. year_month_day_last is a field-based time point with a resolution of days, except that it is restricted to pointing to the last day of a year and month. [Note: year_month_day_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note] year_month_day_last meets the Cpp17EqualityComparable (Table 25) and Cpp17LessThanComparable (Table 26) requirements.

2 year_month_day_last is a trivially copyable and standard-layout class type.

27.8.15.2 Member functions [time.cal.ymdlast.members]
constexpr year_month_day_last(const chrono::year& y,
 const chrono::month_day_last& mdl) noexcept;
1 Effects: Initializes y_ with y and mdl_ with mdl.
constexpr year_month_day_last& operator+=(const months& m) noexcept;
2 Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).
3 Effects: *this = *this + m.
4 Returns: *this.
constexpr year_month_day_last& operator-=(const months& m) noexcept;
5 Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).
6 Effects: *this = *this - m.
7 Returns: *this.

8 Effects: *this = *this + y.
9 Returns: *this.
constexpr year_month_day_last& operator-=(const years& y) noexcept;
10 Effects: *this = *this - y.
11 Returns: *this.
constexpr chrono::year year() const noexcept;
12 Returns: y_.
constexpr chrono::month month() const noexcept;
13 Returns: mdl_.month().

§ 27.8.15.2 ©ISO/IEC 2020 – All rights reserved 1281
constexpr chrono::month_day_last month_day_last() const noexcept;

Returns: mdl_.

constexpr chrono::day day() const noexcept;

Returns: If ok() is true, returns a day representing the last day of the (year, month) pair represented by *this. Otherwise, the returned value is unspecified.

[Note: This value may be computed on demand. —end note]

constexpr operator sys_days() const noexcept;

Returns: sys_days{year()/month()/day()}.

constexpr explicit operator local_days() const noexcept;

Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;

Returns: y_.ok() && mdl_.ok().
template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_day_last& ymdl);

Effects: Equivalent to:

return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}"),
    ymdl.year(), ymdl.month_day_last());

27.8.16 Class year_month_weekday

27.8.16.1 Overview

namespace std::chrono {
    class year_month_weekday {
        chrono::year y_;           // exposition only
        chrono::month m_;           // exposition only
        chrono::weekday_indexed wdi_; // exposition only

    public:
        year_month_weekday() = default;
        constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
            const chrono::weekday_indexed& wdi) noexcept;
        constexpr year_month_weekday(const sys_days& dp) noexcept;
        constexpr explicit year_month_weekday(const local_days& dp) noexcept;
        constexpr year_month_weekday& operator+=(const months& m) noexcept;
        constexpr year_month_weekday& operator-=(const months& m) noexcept;
        constexpr year_month_weekday& operator+=(const years& y) noexcept;
        constexpr year_month_weekday& operator-=(const years& y) noexcept;
        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::weekday weekday() const noexcept;
        constexpr unsigned index() const noexcept;
        constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
        constexpr operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

year_month_weekday represents a specific year, month, and \( n^{th} \) weekday of the month. year_month_weekday
is a field-based time point with a resolution of days. [Note: year_month_weekday supports years- and
months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_-
days, which efficiently supports days-oriented arithmetic. — end note] year_month_weekday meets the
Cpp17EqualityComparable (Table 25) requirements.

year_month_weekday is a trivially copyable and standard-layout class type.

27.8.16.2 Member functions

constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
    const chrono::weekday_indexed& wdi) noexcept;

Effects: Initializes \( y_ \) with \( y \), \( m_ \) with \( m \), and \( wdi_ \) with \( wdi \).

constexpr year_month_weekday(const sys_days& dp) noexcept;

Effects: Constructs an object of type year_month_weekday which corresponds to the date represented
by \( dp \).

Remarks: For any value ymdl of type year_month_weekday for which ymdl.ok() is true, ymdl ==
year_month_weekday{sys_days{ymdl}} is true.

constexpr explicit year_month_weekday(const local_days& dp) noexcept;

Effects: Equivalent to constructing with sys_days{dp.time_since_epoch()}. 
constexpr year_month_weekday& operator+=(const months& m) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Effects: *this = *this + m.

Returns: *this.

constexpr year_month_weekday& operator-=(const months& m) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Effects: *this = *this - m.

Returns: *this.

constexpr year_month_weekday& operator+=(const years& y) noexcept;

Effects: *this = *this + y.

Returns: *this.

constexpr year_month_weekday& operator-=(const years& y) noexcept;

Effects: *this = *this - y.

Returns: *this.

constexpr chrono::year year() const noexcept;

Returns: y_.

constexpr chrono::month month() const noexcept;

Returns: m_.

constexpr chrono::weekday weekday() const noexcept;

Returns: wdi_.weekday().

constexpr unsigned index() const noexcept;

Returns: wdi_.index().

constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

Returns: wdi_.

constexpr operator sys_days() const noexcept;

Returns: If y_.ok() && m_.ok() && wdi_.weekday().ok(), returns a sys_days that represents the date \((index() - 1) \times 7\) days after the first weekday() of year()/month(). If index() is 0 the returned sys_days represents the date 7 days prior to the first weekday() of year()/month(). Otherwise the returned value is unspecified.

constexpr explicit operator local_days() const noexcept;

Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;

Returns: If any of y_.ok(), m_.ok(), or wdi_.ok() is false, returns false. Otherwise, if *this represents a valid date, returns true. Otherwise, returns false.

27.8.16.3 Non-member functions

constexpr bool operator==(const year_month_weekday& x, const year_month_weekday& y) noexcept;

Returns:

x.year() == y.year() && x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()
constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: (ymwd.year() / ymwd.month() + dm) / ymwd.weekday_indexed().

constexpr year_month_weekday operator+(const months& dm, const year_month_weekday& ymwd) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: ymwd + dm.

constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: ymwd + (-dm).

constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const years& dy) noexcept;

Returns: {ymwd.year() + dy, ymwd.month(), ymwd.weekday_indexed()}. 

constexpr year_month_weekday operator+(const years& dy, const year_month_weekday& ymwd) noexcept;

Returns: ymwd + dy.

constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const years& dy) noexcept;

Returns: ymwd + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const year_month_weekday& ymwd);

Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}//{}/"),
ymwd.year(), ymwd.month(), ymwd.weekday_indexed());

27.8.17 Class year_month_weekday_last  [time.cal.ymwdlast]
27.8.17.1 Overview  [time.cal.ymwdlast.overview]

namespace std::chrono {

class year_month_weekday_last {
    chrono::year y_;  // exposition only
    chrono::month m_;  // exposition only
    chrono::weekday_last wdl_;  // exposition only

public:
    constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
                                        const chrono::weekday_last& wdl) noexcept;

    constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
    constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
    constexpr year_month_weekday_last& operator+=(const years& y) noexcept;
    constexpr year_month_weekday_last& operator-=(const years& y) noexcept;

    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;
    constexpr chrono::weekday weekday() const noexcept;
    constexpr chrono::weekday_last weekday_last() const noexcept;

    constexpr operator sys_days() const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
};
}
year_month_weekday_last represents a specific year, month, and last weekday of the month. year_month_weekday_last is a field-based time point with a resolution of days, except that it is restricted to pointing to the last weekday of a year and month. \[Note: year_month_weekday_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. \] year_month_weekday_last meets the Cpp17EqualityComparable (Table 25) requirements.

eyear_month_weekday_last is a trivially copyable and standard-layout class type.

27.8.17.2 Member functions

```cpp
constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m, const chrono::weekday_last& wdl) noexcept;
Effects: initialises y_ with y, m_ with m, and wdl_ with wdl.
```

```cpp
constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).
Effects: \*this = \*this + m.
Returns: \*this.
```

```cpp
constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).
Effects: \*this = \*this - m.
Returns: \*this.
```

```cpp
constexpr year_month_weekday_last& operator+=(const years& y) noexcept;
Effects: \*this = \*this + y.
Returns: \*this.
```

```cpp
constexpr year_month_weekday_last& operator-=(const years& y) noexcept;
Effects: \*this = \*this - y.
Returns: \*this.
```

```cpp
constexpr chrono::year year() const noexcept;
Returns: y_.
```

```cpp
constexpr chrono::month month() const noexcept;
Returns: m_.
```

```cpp
constexpr chrono::weekday weekday() const noexcept;
Returns: wdl_.weekday().
```

```cpp
constexpr chrono::weekday_last weekday_last() const noexcept;
Returns: wdl_.
```

```cpp
constexpr operator sys_days() const noexcept;
Returns: If ok() == true, returns a sys_days that represents the last weekday() of year()/month(). Otherwise the returned value is unspecified.
```

```cpp
constexpr explicit operator local_days() const noexcept;
Returns: local_days{sys_days{*this}.time_since_epoch()}.
```

```cpp
constexpr bool ok() const noexcept;
Returns: y_.ok() && m_.ok() && wdl_.ok().
```
27.8.17.3 Non-member functions

constexpr bool operator==(const year_month_weekday_last& x, 
const year_month_weekday_last& y) noexcept;

Returns:
  x.year() == y.year() && x.month() == y.month() && x.weekday_last() == y.weekday_last()

constexpr year_month_weekday_last 
operator+(const year_month_weekday_last& ymwdl, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: (ymwdl.year() / ymwdl.month() + dm) / ymwdl.weekday_last().

constexpr year_month_weekday_last 
operator+(const months& dm, const year_month_weekday_last& ymwdl) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: ymwdl + dm.

constexpr year_month_weekday_last 
operator+(const year_month_weekday_last& ymwdl, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.4.3.2).

Returns: ymwdl + (-dm).

constexpr year_month_weekday_last 
operator+(const year_month_weekday_last& ymwdl, const years& dy) noexcept;

Returns: {ymwdl.year()+dy, ymwdl.month(), ymwdl.weekday_last()}.

constexpr year_month_weekday_last 
operator+(const years& dy, const year_month_weekday_last& ymwdl) noexcept;

Returns: ymwdl + dy.

constexpr year_month_weekday_last 
operator-(const year_month_weekday_last& ymwdl, const years& dy) noexcept;

Returns: ymwdl + (-dy).

template<class charT, class traits> 
basic_ostream<charT, traits>& 
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday_last& ymwdl);

Effects: Equivalent to:
  return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{1}/{1}/{1}"), 
                     ymwdl.year(), ymwdl.month(), ymwdl.weekday_last());

27.8.18 Conventional syntax operators

A set of overloaded operator/ functions provides a conventional syntax for the creation of civil calendar dates.

[Note: The year, month, and day are accepted in any of the following 3 orders:
  year/month/day
  month/day/year
  day/month/year

Anywhere a day is required, any of the following can also be specified:
  last
  weekday[i]
  weekday[last]
  — end note]
[Note: Partial-date types such as `year_month` and `month_day` can be created by not applying the second division operator for any of the three orders. For example:

```cpp
year_month ym = 2015y/April;
month_day md1 = April/4;
month_day md2 = 4d/April;
```

— end note]

[Example:

```cpp
auto a = 2015/4/4; // a == int(125)
auto b = 2015y/4/4; // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April; // error: no viable operator/ for first /
auto d = 2015/April/4; // error: no viable operator/ for first /
```

— end example]

```cpp
constexpr year_month
operator/(const year& y, const month& m) noexcept;
```

Returns: `{y, m}`.

```cpp
constexpr year_month
operator/(const year& y, int m) noexcept;
```

Returns: `y / month(m)`.

```cpp
constexpr month_day
operator/(const month& m, const day& d) noexcept;
```

Returns: `{m, d}`.

```cpp
constexpr month_day
operator/(const month& m, int d) noexcept;
```

Returns: `m / day(d)`.

```cpp
constexpr month_day
operator/(int m, const day& d) noexcept;
```

Returns: `month(m) / d`.

```cpp
constexpr month_day
operator/(const day& d, const month& m) noexcept;
```

Returns: `m / d`.

```cpp
constexpr month_day
operator/(const day& d, int m) noexcept;
```

Returns: `month(m) / d`.

```cpp
constexpr month_day_last
operator/(const month& m, last_spec) noexcept;
```

Returns: `month_day_last(m)`.

```cpp
constexpr month_day_last
operator/(int m, last_spec) noexcept;
```

Returns: `month(m) / last`.

```cpp
constexpr month_day_last
operator/(last_spec, const month& m) noexcept;
```

Returns: `m / last`.

```cpp
constexpr month_day_last
operator/(last_spec, int m) noexcept;
```

Returns: `month(m) / last`.
constexpr month_weekday
operator/(const month& m, const weekday_indexed& wdi) noexcept;
  Returns: \{m, wdi\}.

constexpr month_weekday
operator/(int m, const weekday_indexed& wdi) noexcept;
  Returns: month(m) / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, const month& m) noexcept;
  Returns: m / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, int m) noexcept;
  Returns: month(m) / wdi.

constexpr month_weekday_last
operator/(const month& m, const weekday_last& wdl) noexcept;
  Returns: \{m, wdl\}.

constexpr month_weekday_last
operator/(int m, const weekday_last& wdl) noexcept;
  Returns: month(m) / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, const month& m) noexcept;
  Returns: m / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, int m) noexcept;
  Returns: month(m) / wdl.

constexpr year_month_day
operator/(const year_month& ym, const day& d) noexcept;
  Returns: \{ym.year(), ym.month(), d\}.

constexpr year_month_day
operator/(const year_month& ym, int d) noexcept;
  Returns: ym / day(d).

constexpr year_month_day
operator/(const year& y, const month_day& md) noexcept;
  Returns: y / md.month() / md.day().

constexpr year_month_day
operator/(int y, const month_day& md) noexcept;
  Returns: year(y) / md.

constexpr year_month_day
operator/(const month_day& md, const year& y) noexcept;
  Returns: y / md.

constexpr year_month_day
operator/(const month_day& md, int y) noexcept;
  Returns: year(y) / md.

constexpr year_month_day_last
operator/(const year_month& ym, last_spec) noexcept;
  Returns: \{ym.year(), month_day_last{ym.month()}\}.
constexpr year_month_day_last
    operator/(const year& y, const month_day_last& mdl) noexcept;
    Returns: \{y, mdl\}.

constexpr year_month_day_last
    operator/(int y, const month_day_last& mdl) noexcept;
    Returns: year(y) / mdl.

constexpr year_month_day_last
    operator/(const month_day_last& mdl, const year& y) noexcept;
    Returns: y / mdl.

constexpr year_month_day_last
    operator/(const month_day_last& mdl, int y) noexcept;
    Returns: year(y) / mdl.

constexpr year_month_weekday
    operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;
    Returns: \{ym.year(), ym.month(), wdi\}.

constexpr year_month_weekday
    operator/(const year& y, const month_weekday& mwd) noexcept;
    Returns: \{y, mwd.month(), mwd.weekday_indexed()\}.

constexpr year_month_weekday
    operator/(int y, const month_weekday& mwd) noexcept;
    Returns: year(y) / mwd.

constexpr year_month_weekday
    operator/(const month_weekday& mwd, const year& y) noexcept;
    Returns: y / mwd.

constexpr year_month_weekday
    operator/(const month_weekday& mwd, int y) noexcept;
    Returns: year(y) / mwd.

constexpr year_month_weekday_last
    operator/(const year_month& ym, const weekday_last& wdl) noexcept;
    Returns: \{ym.year(), ym.month(), wdl\}.

constexpr year_month_weekday_last
    operator/(const year& y, const month_weekday_last& mwdl) noexcept;
    Returns: \{y, mwdl.month(), mwdl.weekday_last()\}.

constexpr year_month_weekday_last
    operator/(int y, const month_weekday_last& mwdl) noexcept;
    Returns: year(y) / mwdl.

constexpr year_month_weekday_last
    operator/(const month_weekday_last& mwdl, const year& y) noexcept;
    Returns: y / mwdl.

constexpr year_month_weekday_last
    operator/(const month_weekday_last& mwdl, int y) noexcept;
    Returns: year(y) / mwdl.

\section{Class template hh_mm_ss}  \[time.hms\]
\subsection{Overview}  \[time.hms.overview\]

namespace std::chrono {
template<class Duration> class hh_mm_ss {
public:
    static constexpr unsigned fractional_width = see below;
    using precision = see below;
    constexpr hh_mm_ss() noexcept : hh_mm_ss(Duration::zero()) {}
    constexpr explicit hh_mm_ss(Duration d);
    constexpr bool is_negative() const noexcept;
    constexpr chrono::hours hours() const noexcept;
    constexpr chrono::minutes minutes() const noexcept;
    constexpr chrono::seconds seconds() const noexcept;
    constexpr precision subseconds() const noexcept;
    constexpr explicit operator precision() const noexcept;
    constexpr precision to_duration() const noexcept;
private:
    bool is_neg;       // exposition only
    chrono::hours h;   // exposition only
    chrono::minutes m; // exposition only
    chrono::seconds s; // exposition only
    precision ss;      // exposition only
};

1 The *hh_mm_ss* class template splits a *duration* into a multi-field time structure *hours:minutes:seconds* and possibly *subseconds*, where *subseconds* will be a duration unit based on a non-positive power of 10. The *Duration* template parameter dictates the precision to which the time is split. A *hh_mm_ss* models negative durations with a distinct *is_negative* getter that returns *true* when the input duration is negative. The individual duration fields always return non-negative durations even when *is_negative()* indicates the structure is representing a negative duration.

2 If *Duration* is not an instance of *duration*, the program is ill-formed.

### 27.9.2 Members

static constexpr unsigned fractional_width = see below;

1 *fractional_width* is the number of fractional decimal digits represented by *precision*. *fractional_width* has the value of the smallest possible integer in the range \([0, 18]\) such that *precision* will exactly represent all values of *Duration*. If no such value of *fractional_width* exists, then *fractional_width* is 6. [Example: See Table 98 for some durations, the resulting *fractional_width*, and the formatted fractional second output of *Duration{1}*.]

</tbody>
</table>
using precision = see below;

constexpr explicit hh_mm_ss(Duration d);

Effects: Constructs an object of type hh_mm_ss which represents the Duration d with precision.

(3.1) — Initializes is_neg with d < Duration::zero().
(3.2) — Initializes h with duration_cast<chrono::hours>(abs(d)).
(3.3) — Initializes m with duration_cast<chrono::minutes>(abs(d) - hours()).
(3.4) — Initializes s with duration_cast<chrono::seconds>(abs(d) - hours() - minutes()).
(3.5) — If treat_as_floating_point_v<precision::rep> is true, initializes ss with abs(d) - hours() - minutes() - seconds(). Otherwise, initializes ss with duration_cast<precision>(abs(d) - hours() - minutes() - seconds()).

[Note: When precision::rep is integral and precision::period is ratio<1>, subseconds() always returns a value equal to 0s. — end note]

Postconditions: If treat_as_floating_point_v<precision::rep> is true, to_duration() returns d, otherwise to_duration() returns duration_cast<precision>(d).

constexpr bool is_negative() const noexcept;

Returns: is_neg.

constexpr chrono::hours hours() const noexcept;

Returns: h.

constexpr chrono::minutes minutes() const noexcept;

Returns: m.

constexpr chrono::seconds seconds() const noexcept;

Returns: s.

constexpr precision subseconds() const noexcept;

Returns: ss.

constexpr precision to_duration() const noexcept;

Returns: If is_neg, returns -(h + m + s + ss), otherwise returns h + m + s + ss.

constexpr explicit operator precision() const noexcept;

Returns: to_duration().

27.9.3 Non-members

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const hh_mm_ss<Duration>& hms);

Effects: Equivalent to:

return os << format(os.getloc(), STATICALLY-WIDEN<charT>("%T"), hms);

[Example:

for (auto ms : {-4083007ms, 4083007ms, 65745123ms}) {
    hh_mm_ss hms{ms};
    cout << hms << 'n';
}
cout << hh_mm_ss(65745a) << 'n';
Produces the output (assuming the "C" locale):
- 01:08:03.007
  01:08:03.007
  18:15:45.123
  18:15:45
— end example

27.10 12/24 hours functions

These functions aid in translating between a 12h format time of day and a 24h format time of day.

```cpp
constexpr bool is_am(const hours& h) noexcept;
```

Returns: \(00h <= h && h <= 10h\).

```cpp
constexpr bool is_pm(const hours& h) noexcept;
```

Returns: \(11h <= h && h <= 23h\).

```cpp
constexpr hours make12(const hours& h) noexcept;
```

Returns: The 12-hour equivalent of \(h\) in the range \([1h, 12h]\). If \(h\) is not in the range \([0h, 23h]\), the value returned is unspecified.

```cpp
constexpr hours make24(const hours& h, bool is_pm) noexcept;
```

Returns: If \(is_pm\) is \(false\), returns the 24-hour equivalent of \(h\) in the range \([0h, 11h]\), assuming \(h\) represents an ante meridiem hour. Otherwise, returns the 24-hour equivalent of \(h\) in the range \([12h, 23h]\), assuming \(h\) represents a post meridiem hour. If \(h\) is not in the range \([1h, 12h]\), the value returned is unspecified.

27.11 Time zones

27.11.1 In general

27.11 describes an interface for accessing the IANA Time Zone Database that interoperates with `sys_time` and `local_time`. This interface provides time zone support to both the civil calendar types (27.8) and to user-defined calendars.

27.11.2 Time zone database

```cpp
namespace std::chrono {
    struct tzdb {
        string version;
        vector<time_zone> zones;
        vector<time_zone_link> links;
        vector<leap_second> leap_seconds;

        const time_zone* locate_zone(string_view tz_name) const;
        const time_zone* current_zone() const;
    };
}
```

Each vector in a `tzdb` object is sorted to enable fast lookup.

```cpp
const time_zone* locate_zone(string_view tz_name) const;
```

Returns:

- If `zones` contains an element `tz` for which `tz.name() == tz_name`, a pointer to `tz`;
- otherwise, if `links` contains an element `tz_l` for which `tz_l.name() == tz_name`, then a pointer to the element `tz` of `zones` for which `tz.name() == tz_l.target()`.

[Note: A `time_zone_link` specifies an alternative name for a `time_zone`. — end note]

Throws: If a `const time_zone*` cannot be found as described in the `Returns:` clause, throws a `runtime_error`. [Note: On non-exceptional return, the return value is always a pointer to a valid `time_zone`. — end note]
const time_zone* current_zone() const;

Returns: A pointer to the time zone which the computer has set as its local time zone.

27.11.2.2 Class tzdb_list

namespace std::chrono {

class tzdb_list {
public:
  tzdb_list(const tzdb_list&) = delete;
  tzdb_list& operator=(const tzdb_list&) = delete;

  // unspecified additional constructors

  class const_iterator;

  const tzdb& front() const noexcept;

  const_iterator erase_after(const_iterator p);

  const_iterator begin() const noexcept;
  const_iterator end() const noexcept;
  const_iterator cbegin() const noexcept;
  const_iterator cend() const noexcept;
};
}

The tzdb_list database is a singleton; the unique object of type tzdb_list can be accessed via the get_tzdb_list() function. [Note: This access is only needed for those applications that need to have long uptimes and have a need to update the time zone database while running. Other applications can implicitly access the front() of this list via the read-only namespace scope functions get_tzdb(), locate_zone(), and current_zone(). — end note] The tzdb_list object contains a list of tzdb objects.

tzdb_list::const_iterator is a constant iterator which meets the Cpp17ForwardIterator requirements and has a value type of tzdb.

const tzdb& front() const noexcept;

Synchronization: This operation is thread-safe with respect to reload_tzdb(). [Note: reload_tzdb() pushes a new tzdb onto the front of this container. — end note]

Returns: A reference to the first tzdb in the container.

const_iterator erase_after(const_iterator p);

Preconditions: The iterator following p is dereferenceable.

Effects: Erases the tzdb referred to by the iterator following p.

Returns: An iterator pointing to the element following the one that was erased, or end() if no such element exists.

Postconditions: No pointers, references, or iterators are invalidated except those referring to the erased tzdb. [Note: It is not possible to erase the tzdb referred to by begin(). — end note]

Throws: Nothing.

const_iterator begin() const noexcept;

Returns: An iterator referring to the first tzdb in the container.

const_iterator end() const noexcept;

Returns: An iterator referring to the position one past the last tzdb in the container.

const_iterator cbegin() const noexcept;

Returns: begin().
const_iterator cend() const noexcept;

Returns: end().

27.11.2.3 Time zone database access

tzdb_list& get_tzdb_list();

Effects: If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a tzdb_list holding a single initialized tzdb.

Synchronization: It is safe to call this function from multiple threads at one time.

Returns: A reference to the database.

Throws: runtime_error if for any reason a reference cannot be returned to a valid tzdb_list containing one or more valid tzdb.

const tzdb& get_tzdb();

Returns: get_tzdb_list().front().

const time_zone* locate_zone(string_view tz_name);

Returns: get_tzdb().locate_zone(tz_name).

[Note: The time zone database will be initialized if this is the first reference to the database. — end note]

const time_zone* current_zone();

Returns: get_tzdb().current_zone().

27.11.2.4 Remote time zone database support

The local time zone database is that supplied by the implementation when the program first accesses the database, for example via current_zone(). While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the remote time zone database.

const tzdb& reload_tzdb();

Effects: This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the tzdb_list accessed by get_tzdb_list().

Synchronization: This function is thread-safe with respect to get_tzdb_list().front() and get_tzdb_list().erase_after().

Postconditions: No pointers, references, or iterators are invalidated.

Returns: get_tzdb_list().front().

Throws: runtime_error if for any reason a reference cannot be returned to a valid tzdb.

string remote_version();

Returns: The latest remote database version.

[Note: This can be compared with get_tzdb().version to discover if the local and remote databases are equivalent. — end note]

27.11.3 Exception classes

27.11.3.1 Class nonexistent_local_time

namespace std::chrono {
  class nonexistent_local_time : public runtime_error {
    public:
      template<class Duration>
      nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
  };
}

§ 27.11.3.1 ©ISO/IEC 2020 – All rights reserved 1295
nonexistent_local_time is thrown when an attempt is made to convert a non-existent local_time to a sys_time without specifying choose::earliest or choose::latest.

template<class Duration>
nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);

Preconditions: i.result == local_info::nonexistent is true.

Effects: Initializes the base class with a sequence of char equivalent to that produced by os.str() initialized as shown below:

    ostringstream os;
    os << tp << " is in a gap between
    " << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ',
    " and\n" << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ',
    " which are both equivalent to
    " << i.first.end << " UTC";

Example:
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time{"America/New_York",
            local_days{Sunday[2]/March/2016} + 2h + 30min};
    } catch (const nonexistent_local_time& e) {
        std::cout << e.what() << '\n';
    }
}

Produces the output:
2016-03-13 02:30:00 is in a gap between
2016-03-13 02:00:00 EST and
2016-03-13 03:00:00 EDT which are both equivalent to
2016-03-13 07:00:00 UTC

— end example]

§ 27.11.3.2 Class ambiguous_local_time

namespace std::chrono {
    class ambiguous_local_time : public runtime_error {
public:
    template<class Duration>
    ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
};

ambiguous_local_time is thrown when an attempt is made to convert an ambiguous local_time to a sys_time without specifying choose::earliest or choose::latest.

template<class Duration>
ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);

Preconditions: i.result == local_info::ambiguous is true.

Effects: Initializes the base class with a sequence of char equivalent to that produced by os.str() initialized as shown below:

    ostringstream os;
    os << tp << " is ambiguous. It could be\n" << tp << ' ' << i.first.abbrev << " == "
    << tp - i.first.offset << " UTC or\n" << tp << ' ' << i.second.abbrev << " == "
    << tp - i.second.offset << " UTC";
4 

[Example:] 
```cpp
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time("America/New_York",
                              local_days(Sunday[1]/November/2016) + 1h + 30min);
    } catch (const ambiguous_local_time& e) {
        std::cout << e.what() << '
';
    }
}
```

Produces the output:

2016-11-06 01:30:00 is ambiguous. It could be 
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or 
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC

— end example]

27.11.4 Information classes

27.11.4.1 Class sys_info

```cpp
namespace std::chrono {
    struct sys_info {
        sys_seconds begin;
        sys_seconds end;
        seconds offset;
        minutes save;
        string abbrev;
    };
}
```

1 A sys_info object can be obtained from the combination of a time_zone and either a sys_time or local_time. It can also be obtained from a zoned_time, which is effectively a pair of a time_zone and sys_time.

2 [Note: This type provides a low-level interface to time zone information. Typical conversions from sys_time to local_time will use this class implicitly, not explicitly. — end note]

3 The begin and end data members indicate that, for the associated time_zone and time_point, the offset and abbrev are in effect in the range [begin, end). This information can be used to efficiently iterate the transitions of a time_zone.

4 The offset data member indicates the UTC offset in effect for the associated time_zone and time_point. The relationship between local_time and sys_time is:

   offset = local_time - sys_time

5 The save data member is extra information not normally needed for conversion between local_time and sys_time. If save != Omin, this sys_info is said to be on “daylight saving” time, and offset - save suggests what offset this time_zone might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the time_zone with a time_point that returns a sys_info where save == 0min. There is no guarantee what time_point might return such a sys_info except that it is guaranteed not to be in the range [begin, end) (if save != 0min for this sys_info).

6 The abbrev data member indicates the current abbreviation used for the associated time_zone and time_point. Abbreviations are not unique among the time_zones, and so one cannot reliably map abbreviations back to a time_zone and UTC offset.

```cpp
template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_info& r);
```

7 Effects: Streams out the sys_info object r in an unspecified format.

8 Returns: os.
27.11.4.2 Class `local_info`

```cpp
namespace std::chrono {
    struct local_info {
        static constexpr int unique = 0;
        static constexpr int nonexistent = 1;
        static constexpr int ambiguous = 2;

        int result;
        sys_info first;
        sys_info second;
    };
}
```

1 [Note: This type provides a low-level interface to time zone information. Typical conversions from `local_time` to `sys_time` will use this class implicitly, not explicitly. — end note]

2 Describes the result of converting a `local_time` to a `sys_time` as follows:

(2.1) — When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.

(2.2) — If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that ends just prior to the `local_time`, and `second` will be filled out with the `sys_info` that begins just after the `local_time`.

(2.3) — If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_info& r);
```

3 Effects: Streams out the `local_info` object `r` in an unspecified format.

4 Returns: `os`.

27.11.5 Class `time_zone`

27.11.5.1 Overview

```cpp
namespace std::chrono {
    class time_zone {
        public:
            time_zone(time_zone&&) = default;
            time_zone& operator=(time_zone&&) = default;

            // unspecified additional constructors

            string_view name() const noexcept;

            template<class Duration> sys_info get_info(const sys_time<Duration>& st) const;
            template<class Duration> local_info get_info(const local_time<Duration>& tp) const;

            template<class Duration>
                sys_time<common_type_t<Duration, seconds>>
                    to_sys(const local_time<Duration>& tp) const;

            template<class Duration>
                sys_time<common_type_t<Duration, seconds>>
                    to_sys(const local_time<Duration>& tp, choose z) const;

            template<class Duration>
                local_time<common_type_t<Duration, seconds>>
                    to_local(const sys_time<Duration>& tp) const;
    };
}
```

§ 27.11.5.1 © ISO/IEC 2020 – All rights reserved
A `time_zone` represents all time zone transitions for a specific geographic area. `time_zone` construction is unspecified, and performed as part of database initialization. [Note: `const time_zone` objects can be accessed via functions such as `locate_zone`. — end note]

### 27.11.5.2 Member functions

- **string_view name() const noexcept;**
  - Returns: The name of the `time_zone`
  - [Example: "America/New_York". — end example]

- **template<class Duration>
  sys_info get_info(const sys_time<Duration>& st) const;**
  - Returns: A `sys_info` i for which st is in the range `[i.begin, i.end)`

- **template<class Duration>
  local_info get_info(const local_time<Duration>& tp) const;**
  - Returns: A `local_info` for `tp`

- **template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
  to_sys(const local_time<Duration>& tp) const;**
  - Returns: A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`
  - Throws: If the conversion from `tp` to a `sys_time` is ambiguous, throws `ambiguous_local_time`. If the `tp` represents a non-existent time between two UTC `time_points`, throws `nonexistent_local_time`

- **template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
  to_sys(const local_time<Duration>& tp, choose z) const;**
  - Returns: A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`
  - If the conversion from `tp` to a `sys_time` is ambiguous, returns the earlier `sys_time` if `z == choose::earliest`, and returns the later `sys_time` if `z == choose::latest`. If the `tp` represents a non-existent time between two UTC `time_points`, then the two UTC `time_points` will be the same, and that UTC `time_point` will be returned.

- **template<class Duration>
  local_time<common_type_t<Duration, seconds>>
  to_local(const sys_time<Duration>& tp) const;**
  - Returns: The `local_time` associated with `tp` and this `time_zone`

### 27.11.5.3 Non-member functions

- **bool operator==(const time_zone& x, const time_zone& y) noexcept;**
  - Returns: `x.name() == y.name()`.

- **strong_ordering operator<=>(const time_zone& x, const time_zone& y) noexcept;**
  - Returns: `x.name() <=> y.name()`.

### 27.11.6 Class template zoned_traits

```cpp
namespace std::chrono {
    template<class T> struct zoned_traits {};
}
```

`zoned_traits` provides a means for customizing the behavior of `zoned_time<Duration, TimeZonePtr>` for the `zoned_time` default constructor, and constructors taking `string_view`. A specialization for `const time_zone*` is provided by the implementation:

```cpp
namespace std::chrono {
    template<> struct zoned_traits<const time_zone*>{
        static const time_zone* default_zone();
    }
}
```
static const time_zone* locate_zone(string_view name);
};

static const time_zone* default_zone();

Returns: std::chrono::locate_zone("UTC").

static const time_zone* locate_zone(string_view name);

Returns: std::chrono::locate_zone(name).

27.11.7 Class template zoned_time

27.11.7.1 Overview

namespace std::chrono {

class zoned_time {

public:

    using duration = common_type_t<Duration, seconds>;

private:

    TimeZonePtr zone_; // exposition only
    sys_time<duration> tp_; // exposition only

    using traits = zoned_traits<TimeZonePtr>; // exposition only

public:

    zoned_time();
    zoned_time(const zoned_time&) = default;
    zoned_time& operator=(const zoned_time&) = default;
    zoned_time(const sys_time<Duration>& st);
    explicit zoned_time(TimeZonePtr z);
    explicit zoned_time(string_view name);

    template<class Duration2>
    zoned_time(const zoned_time<Duration2, TimeZonePtr>& zt);

    zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
    zoned_time(string_view name, const sys_time<Duration>& st);

    zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
    zoned_time(string_view name, const local_time<Duration>& tp);
    zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
    zoned_time(string_view name, const local_time<Duration>& tp, choose c);

    template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& zt);

    template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& zt, choose);

    template<class Duration2, class TimeZonePtr2>
    zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& zt);

    template<class Duration2, class TimeZonePtr2>
    zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& zt, choose);

    zoned_time& operator=(const sys_time<Duration>& st);
    zoned_time& operator=(const local_time<Duration>& ut);

    operator sys_time<duration>() const;
    explicit operator local_time<duration>() const;

    TimeZonePtr get_time_zone() const;
    local_time<duration> get_local_time() const;
    sys_time<duration> get_sys_time() const;

};
ISO/IEC JTC1 SC22 WG21 N4860

```cpp
class sys_info {
public:
    get_info() const;
};

zoned_time() -> zoned_time<seconds>;

template<class Duration>
zoned_time(sys_time<Duration>)
    -> zoned_time<common_type_t<Duration, seconds>>;

template<class TimeZonePtrOrName>
using time_zone_representation =
    // exposition only
    conditional_t<is_convertible_v<TimeZonePtrOrName, string_view>,
    const time_zone*,
    remove_cvref_t<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName>
zoned_time(TimeZonePtrOrName&&)
    -> zoned_time<seconds, time_zone_representation<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName, class Duration>
zoned_time(TimeZonePtrOrName&&, sys_time<Duration>)
    -> zoned_time<common_type_t<Duration, seconds>,
    time_zone_representation<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName, class Duration>
zoned_time(TimeZonePtrOrName&&, local_time<Duration>,
            choose = choose::earliest)
    -> zoned_time<common_type_t<Duration, seconds>,
    time_zone_representation<TimeZonePtrOrName>>;

template<class Duration, class TimeZonePtrOrName, class TimeZonePtr2>
zoned_time(TimeZonePtrOrName&&, zoned_time<Duration, TimeZonePtr2>,
            choose = choose::earliest)
    -> zoned_time<common_type_t<Duration, seconds>,
    time_zone_representation<TimeZonePtrOrName>>;
}
```

1. *zoned_time* represents a logical pairing of a *time_zone* and a *time_point* with precision *Duration*. *zoned_time<Duration>* maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.

2. If *Duration* is not a specialization of *chrono::duration*, the program is ill-formed.

3. Every constructor of *zoned_time* that accepts a *string_view* as its first parameter does not participate in class template argument deduction (12.4.1.8).

### 27.11.7.2 Constructors

```
    [time.zone.zonedtime_ctor]
    zoned_time();
```

1. **Constraints**: *traits::default_zone()* is a well-formed expression.

2. **Effects**: Initializes `zone_` with *traits::default_zone()* and default constructs `tp_`.

```
zoned_time(const sys_time<Duration>& st);
```

3. **Constraints**: *traits::default_zone()* is a well-formed expression.

4. **Effects**: Initializes `zone_` with *traits::default_zone()* and `tp_` with `st`.

```
explicit zoned_time(TimeZonePtr z);
```

5. **Preconditions**: `z` refers to a time zone.

6. **Effects**: Initializes `zone_` with *std::move(z)* and default constructs `tp_`.

```
explicit zoned_time(string_view name);
```

7. **Constraints**: *traits::locate_zone(string_view{})* is a well-formed expression and *zoned_time* is constructible from the return type of *traits::locate_zone(string_view{})*.

§ 27.11.7.2 © ISO/IEC 2020 – All rights reserved
Effects: Initializes `zone_` with `traits::locate_zone(name)` and default constructs `tp_`.

```cpp
template<class Duration2>
zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);
```

Constraints: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.
Effects: Initializes `zone_` with `y.zone_` and `tp_` with `y.tp_`.

```cpp
zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
```

Preconditions: `z` refers to a time zone.
Effects: Initializes `zone_` with `std::move(z)` and `tp_` with `st`.

```cpp
zoned_time(string_view name, const sys_time<Duration>& st);
```

Constraints: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `st`.
Effects: Equivalent to construction with `{traits::locate_zone(name), st}`.

```cpp
zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
```

Preconditions: `z` refers to a time zone.
Constraints: `is_convertible_v<

decltype(declval<TimeZonePtr>{}->to_sys(local_time<Duration>{})),
sys_time<duration>>` is true.
Effects: Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp)`.

```cpp
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
```

Preconditions: `z` refers to a time zone.
Constraints: `is_convertible_v<

decltype(declval<TimeZonePtr>{}->to_sys(local_time<Duration>{}, choose::earliest)),
sys_time<duration>>` is true.
Effects: Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp, c)`.

```cpp
zoned_time(string_view name, const local_time<Duration>& tp);
```

Constraints: `zoned_time` is constructible from the return type of `traits::locate_zone(name)`, `local_time<Duration>`, and `choose`.
Effects: Equivalent to construction with `{traits::locate_zone(name), tp, c}`.

```cpp
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
```

Constraints: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.
Preconditions: `z` refers to a valid time zone.
Effects: Initializes `zone_` with `std::move(z)` and `tp_` with `y.tp_`.

```cpp
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);
```

Constraints: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.
Preconditions: `z` refers to a valid time zone.
Effects: Equivalent to construction with \{z, y\}.

[Note: The choose parameter has no effect. — end note]

template<class Duration2, class TimeZonePtr2>
  zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);

Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and the type zoned_time<Duration2, TimeZonePtr2>.

Effects: Equivalent to construction with \{traits::locate_zone(name), y\}.

template<class Duration2, class TimeZonePtr2>
  zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);

Constraints: zoned_time is constructible from the return type of traits::locate_zone(name), the type zoned_time<Duration2, TimeZonePtr2>, and the type choose.

Effects: Equivalent to construction with \{traits::locate_zone(name), y, c\}.

[Note: The choose parameter has no effect. — end note]

27.11.7.3 Member functions

zoned_time& operator=(const sys_time<Duration>& st);
1 Effects: After assignment, get_sys_time() == st. This assignment has no effect on the return value of get_time_zone().
2 Returns: *this.

zoned_time& operator=(const local_time<Duration>& lt);
3 Effects: After assignment, get_local_time() == lt. This assignment has no effect on the return value of get_time_zone().
4 Returns: *this.

operator sys_time<duration>() const;
5 Returns: get_sys_time().

explicit operator local_time<duration>() const;
6 Returns: get_local_time().

TimeZonePtr get_time_zone() const;
7 Returns: zone_.

local_time<duration> get_local_time() const;
8 Returns: zone_->to_local(tp_).

sys_time<duration> get_sys_time() const;
9 Returns: tp_.

sys_info get_info() const;
10 Returns: zone_->get_info(tp_).

27.11.7.4 Non-member functions

template<class Duration1, class Duration2, class TimeZonePtr>
  bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
                  const zoned_time<Duration2, TimeZonePtr>& y);
1 Returns: x.zone_ == y.zone_ && x.tp_ == y.tp_.

template<class charT, class traits, class Duration, class TimeZonePtr>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os,
              const zoned_time<Duration, TimeZonePtr>& t);
2 Effects: Streams the value returned from t.get_local_time() to os using the format "%F %T %Z".

§ 27.11.7.4 ©ISO/IEC 2020 – All rights reserved 1303
Returns: os.

27.11.8 Class leap_second

27.11.8.1 Overview

namespace std::chrono {
    class leap_second {
        public:
            leap_second(const leap_second&) = default;
            leap_second& operator=(const leap_second&) = default;
            // unspecified additional constructors
            constexpr sys_seconds date() const noexcept;
            constexpr seconds value() const noexcept;
    }
}

1 Objects of type leap_second representing the date and value of the leap second insertions are constructed and stored in the time zone database when initialized.

2 [Example:

    for (auto& l : get_tzdb().leap_seconds)
        if (l <= 2018y/March/17d)
            cout << l.date() << ": " << l.value() << 

Produces the output:

1972-07-01 00:00:00: 1s
1973-01-01 00:00:00: 1s
1974-01-01 00:00:00: 1s
1975-01-01 00:00:00: 1s
1976-01-01 00:00:00: 1s
1977-01-01 00:00:00: 1s
1978-01-01 00:00:00: 1s
1979-01-01 00:00:00: 1s
1980-01-01 00:00:00: 1s
1981-07-01 00:00:00: 1s
1982-07-01 00:00:00: 1s
1983-07-01 00:00:00: 1s
1985-07-01 00:00:00: 1s
1988-01-01 00:00:00: 1s
1990-01-01 00:00:00: 1s
1991-01-01 00:00:00: 1s
1992-07-01 00:00:00: 1s
1993-07-01 00:00:00: 1s
1994-07-01 00:00:00: 1s
1996-01-01 00:00:00: 1s
1997-07-01 00:00:00: 1s
1999-01-01 00:00:00: 1s
2006-01-01 00:00:00: 1s
2009-01-01 00:00:00: 1s
2012-07-01 00:00:00: 1s
2015-07-01 00:00:00: 1s
2017-01-01 00:00:00: 1s

— end example]

27.11.8.2 Member functions

constexpr sys_seconds date() const noexcept;
1 Returns: The date and time at which the leap second was inserted.

constexpr seconds value() const noexcept;
2 Returns: +1s to indicate a positive leap second or -1s to indicate a negative leap second. [Note: All leap seconds inserted up through 2019 were positive leap seconds. — end note]
27.11.8.3 Non-member functions

```cpp
constexpr bool operator==(const leap_second& x, const leap_second& y) noexcept;
Returns: x.date() == y.date().
```

```cpp
constexpr strong_ordering operator<=>(const leap_second& x, const leap_second& y) noexcept;
Returns: x.date() <=> y.date().
```

```cpp
template<class Duration>
constexpr bool operator==(const leap_second& x, const sys_time<Duration>& y) noexcept;
Returns: x.date() == y.
```

```cpp
template<class Duration>
constexpr bool operator<(const leap_second& x, const sys_time<Duration>& y) noexcept;
Returns: x.date() < y.
```

```cpp
template<class Duration>
constexpr bool operator<(const sys_time<Duration>& x, const leap_second& y) noexcept;
Returns: y < x.
```

```cpp
template<class Duration>
constexpr bool operator>=(const leap_second& x, const sys_time<Duration>& y) noexcept;
Returns: !(y < x).
```

```cpp
template<class Duration>
constexpr bool operator>=(const sys_time<Duration>& x, const leap_second& y) noexcept;
Returns: !(x < y).
```

```cpp
template<class Duration>
requires three_way_comparable_with<sys_seconds, sys_time<Duration>>
constexpr auto operator<=>(const leap_second& x, const sys_time<Duration>& y) noexcept;
Returns: x.date() <=> y.
```

27.11.9 Class time_zone_link

27.11.9.1 Overview

```cpp
namespace std::chrono {
    class time_zone_link {
        public:
            time_zone_link(time_zone_link&&) = default;
            time_zone_link& operator=(time_zone_link&&) = default;

            // unspecified additional constructors
    }
}
```
A `time_zone_link` specifies an alternative name for a `time_zone`. `time_zone_links` are constructed when the time zone database is initialized.

### 27.11.9.2 Member functions

```cpp
string_view name() const noexcept;
string_view target() const noexcept;
```

1. **Returns:** The alternative name for the time zone.
2. **Returns:** The name of the `time_zone` for which this `time_zone_link` provides an alternative name.

### 27.11.9.3 Non-member functions

```cpp
bool operator==(const time_zone_link& x, const time_zone_link& y) noexcept;
strong_ordering operator<=>(const time_zone_link& x, const time_zone_link& y) noexcept;
```

1. **Returns:** `x.name() == y.name()`.
2. **Returns:** `x.name() <=> y.name()`.

### 27.12 Formatting

Each `formatter` (20.20.5) specialization in the chrono library (27.2) meets the `Formatter` requirements (20.20.5.1). The `parse` member functions of these formatters interpret the format specification as a `chrono-format-spec` according to the following syntax:

```plaintext
chrono-format-spec:
  fill-and-align_opt width_opt precision_opt chrono-specs_opt
chrono-specs:
  conversion-spec
  chrono-specs conversion-spec
  chrono-specs literal-char
literal-char:
  any character other than {, }, or %
conversion-spec:
  % modifier_opt type
type: one of
  E O
    a A b B c C d D e E f F g G h H i I j m M n
  p q r R s S t T u U v V w W x X y Y z Z %
```

The productions `fill-and-align`, `width`, and `precision` are described in 20.20.2. Giving a `precision` specification in the `chrono-format-spec` is valid only for `std::chrono::duration` types where the representation type `Rep` is a floating-point type. For all other `Rep` types, an exception of type `format_error` is thrown if the `chrono-format-spec` contains a `precision` specification. All ordinary multibyte characters represented by `literal-char` are copied unchanged to the output.

Each conversion specifier `conversion-spec` is replaced by appropriate characters as described in Table 99. Some of the conversion specifiers depend on the locale that is passed to the formatting function if the latter takes one, or the global locale otherwise. If the formatted object does not contain the information the conversion specifier refers to, an exception of type `format_error` is thrown.

The result of formatting a `std::chrono::duration` instance holding a negative value, or an `hh_mm_ss` object `h` for which `h.is_negative()` is `true`, is equivalent to the output of the corresponding positive value, with a `STATICALLY-WIDEN<charT>`("-") character sequence placed before the replacement of the initial conversion specifier. [Example:

```cpp
cout << format("{:-%T}", -10'000s); // prints: -02:46:40
cout << format("{:-%H:%M:%S}", -10'000s); // prints: -02:46:40
```
cout << format("minutes {:%M, hours %H, seconds %S}", -10'000s);
    // prints: minutes -46, hours 02, seconds 40

— end example]

4 Unless explicitly requested, the result of formatting a chrono type does not contain time zone abbreviation and time zone offset information. If the information is available, the conversion specifiers %Z and %z will format this information (respectively). [Note: If the information is not available and a %Z or %z conversion specifier appears in the chrono-format-spec, an exception of type format_error is thrown, as described above. — end note]

5 If the type being formatted does not contain the information that the format flag needs, an exception of type format_error is thrown. [Example: A duration does not contain enough information to format as a weekday. — end example] However, if a flag refers to a “time of day” (e.g. %H, %I, %p, etc.), then a specialization of duration is interpreted as the time of day elapsed since midnight.

<table>
<thead>
<tr>
<th>Specifier</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>%a</td>
<td>The locale’s abbreviated weekday name. If the value does not contain a valid weekday, an exception of type format_error is thrown.</td>
</tr>
<tr>
<td>%A</td>
<td>The locale’s full weekday name. If the value does not contain a valid weekday, an exception of type format_error is thrown.</td>
</tr>
<tr>
<td>%b</td>
<td>The locale’s abbreviated month name. If the value does not contain a valid month, an exception of type format_error is thrown.</td>

<tr>
<td>%B</td>
<td>The locale’s full month name. If the value does not contain a valid month, an exception of type format_error is thrown.</td>
</tr>
<tr>
<td>%c</td>
<td>The locale’s date and time representation. The modified command %Ec produces the locale’s alternate date and time representation.</td>
</tr>
<tr>
<td>%C</td>
<td>The year divided by 100 using floored division. If the result is a single decimal digit, it is prefixed with 0. The modified command %EC produces the locale’s alternative representation of the century.</td>
</tr>
<tr>
<td>%d</td>
<td>The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with 0. The modified command %Od produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%D</td>
<td>Equivalent to %m/%d/%y.</td>
</tr>
<tr>
<td>%e</td>
<td>The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with a space. The modified command %Oe produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%F</td>
<td>Equivalent to %Y-%m-%d.</td>
</tr>
<tr>
<td>%g</td>
<td>The last two decimal digits of the ISO week-based year. If the result is a single digit it is prefixed by 0.</td>
</tr>
<tr>
<td>%G</td>
<td>The ISO week-based year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits.</td>
</tr>
<tr>
<td>%h</td>
<td>Equivalent to %b.</td>
</tr>
<tr>
<td>%H</td>
<td>The hour (24-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OHi produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%I</td>
<td>The hour (12-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %Oi produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%j</td>
<td>If the type being formatted is a specialization of duration, the decimal number of days without padding. Otherwise, the day of the year as a decimal number. Jan 1 is 001. If the result is less than three digits, it is left-padded with 0 to three digits.</td>
</tr>
<tr>
<td>%m</td>
<td>The month as a decimal number. Jan is 01. If the result is a single digit, it is prefixed with 0. The modified command %Om produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%M</td>
<td>The minute as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %Om produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%n</td>
<td>A new-line character.</td>
</tr>
<tr>
<td>%p</td>
<td>The locale’s equivalent of the AM/PM designations associated with a 12-hour clock.</td>
</tr>
</tbody>

<tr>
<td><code>%w</code></td>
<td>The weekday as a decimal number (0-6), where Sunday is 0. The modified command <code>%Ow</code> produces the locale’s alternative representation.</td>
</tr>
<tr>
<td><code>%W</code></td>
<td>The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command <code>%OW</code> produces the locale’s alternative representation.</td>
</tr>
<tr>
<td><code>%x</code></td>
<td>The locale’s date representation. The modified command <code>%Ex</code> produces the locale’s alternate date representation.</td>
</tr>
<tr>
<td><code>%X</code></td>
<td>The locale’s time representation. The modified command <code>%EX</code> produces the locale’s alternate time representation.</td>
</tr>
<tr>
<td><code>%y</code></td>
<td>The last two decimal digits of the year. If the result is a single digit it is prefixed by 0. The modified command <code>%Ey</code> produces the locale’s alternative representation of offset from %EC (year only).</td>
</tr>
<tr>
<td><code>%Y</code></td>
<td>The year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits. The modified command <code>%EY</code> produces the locale’s alternative full year representation.</td>
</tr>
<tr>
<td><code>%z</code></td>
<td>The offset from UTC in the ISO 8601 format. For example -0430 refers to 4 hours 30 minutes behind UTC. If the offset is zero, +0000 is used. The modified commands <code>%Ez</code> and <code>%Oz</code> insert a : between the hours and minutes: -04:30. If the offset information is not available, an exception of type format_error is thrown.</td>
</tr>
<tr>
<td><code>%Z</code></td>
<td>The time zone abbreviation. If the time zone abbreviation is not available, an exception of type format_error is thrown.</td>
</tr>
<tr>
<td><code>%</code></td>
<td>A % character.</td>
</tr>
</tbody>
</table>

6 If the chrono-specs is omitted, the chrono object is formatted as if by streaming it to std::ostringstream os and copying os.str() through the output iterator of the context with additional padding and adjustments as specified by the format specifiers. [Example: string s = format("{:==>8}", 42ms); // value of s is "====42ms" — end example]
template<class Duration, class charT>
struct formatter<chrono::sys_time<Duration>, charT> {

Remarks: If %Z is used, it is replaced with STATICALLY-WIDEN<charT>("UTC"). If %z (or a modified
variant of %z) is used, an offset of 0min is formatted.
}

template<class Duration, class charT>
struct formatter<chrono::utc_time<Duration>, charT> {

Remarks: If %Z is used, it is replaced with STATICALLY-WIDEN<charT>("UTC"). If %z (or a modified
variant of %z) is used, an offset of 0min is formatted. If the argument represents a time during a
positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is
STATICALLY-WIDEN<charT>("60").
}

template<class Duration, class charT>
struct formatter<chrono::tai_time<Duration>, charT> {

Remarks: If %Z is used, it is replaced with STATICALLY-WIDEN<charT>("TAI"). If %z (or a modified
variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to
those formatted by a sys_time initialized with

```
    sys_time<Duration>({tp.time_since_epoch()} -
    sys_days{1970y/January/1} - sys_days{1958y/January/1})
```

}

template<class Duration, class charT>
struct formatter<chrono::gps_time<Duration>, charT> {

Remarks: If %Z is used, it is replaced with STATICALLY-WIDEN<charT>("GPS"). If %z (or a modified
variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to
those formatted by a sys_time initialized with

```
    sys_time<Duration>({tp.time_since_epoch()} +
    sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})
```

}

template<class Duration, class charT>
struct formatter<chrono::local_time<Duration>, charT> {

Remarks: If %Z, %z, or a modified version of %z is used, an exception of type format_error is thrown.

```
    local_time_format<Duration> time;
    const string* abbrev = nullptr;
    const seconds* offset_sec = nullptr;
```

}

Let f be a local_time_format<Duration> object passed to formatter::format.

```
    local_time_format<Duration> f;
    local_time_format<Duration> t = f;
```

Returns: {time, abbrev, offset_sec}.
template<class Duration, class TimeZonePtr, class charT>
struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT>
  : formatter<chrono::local_time_format_t<Duration>, charT> {
    template<class FormatContext>
    typename FormatContext::iterator
    format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) {
      return formatter<chrono::local_time_format_t<Duration>, charT>::
        format({tp.get_local_time(), &tp.get_info().abbrev, &tp.get_info().offset}, ctx);
    }
  
  template<class FormatContext>
  typename FormatContext::iterator
  format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx);

Effects: Equivalent to:

sys_info info = tp.get_info();
return format<chrono::local_time_format_t<Duration>, charT>::
  format({tp.get_local_time(), &info.abbrev, &info.offset}, ctx);

27.13 Parsing

Each parse overload specified in this subclause calls from_stream unqualified, so as to enable argument
dependent lookup (6.5.2). In the following paragraphs, let is denote an object of type basic_istream<charT,
traits> and let I be basic_istream<charT, traits>&, where charT and traits are template parameters
in that context.

template<class charT, class traits, class Alloc, class Parsable>

unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);

Constraints: The expression

from_stream(declval<basic_istream<charT, traits>&>(), fmt.c_str(), tp)

is well-formed when treated as an unevaluated operand.

Returns: A manipulator such that the expression is >> parse(fmt, tp) has type I, has value is,
and calls from_stream(is, fmt.c_str(), tp).

template<class charT, class traits, class Alloc, class Parsable>

unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
      basic_string<charT, traits, Alloc>& abbrev);

Constraints: The expression

from_stream(declval<basic_istream<charT, traits>&>(), fmt.c_str(), tp,
            addressof(abbrev))

is well-formed when treated as an unevaluated operand.

Returns: A manipulator such that the expression is >> parse(fmt, tp, abbrev) has type I, has value is,
and calls from_stream(is, fmt.c_str(), tp, addressof(abbrev)).

template<class charT, class traits, class Alloc, class Parsable>

unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
      minutes& offset);

Constraints: The expression

from_stream(declval<basic_istream<charT, traits>&>(),
            fmt.c_str(), tp,
            declval<basic_string<charT, traits, Alloc>&>(),
            &offset)

is well-formed when treated as an unevaluated operand.

Returns: A manipulator such that the expression is >> parse(fmt, tp, offset) has type I, has value is,
and calls:

from_stream(is,
            fmt.c_str(), tp,
            static_cast<basic_string<charT, traits, Alloc>&>(nullptr),
            &offset)

§ 27.13 ©ISO/IEC 2020 – All rights reserved 1310
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
  parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
        basic_string<charT, traits, Alloc>& abbrev, minutes& offset);

Constraints: The expression
  from_stream(std::basic_istream<charT, traits>& is, fmt.c_str(), tp, addressof(abbrev), &offset)

is well-formed when treated as an unevaluated operand.

Returns: A manipulator such that the expression
  is >> parse(fmt, tp, abbrev, offset)
has type
  basic_istream<charT, traits, Alloc>::sio_i
has value
  is
, and calls
  from_stream(is, fmt.c_str(), tp, addressof(abbrev), &offset).

All from_stream overloads behave as unformatted input functions, except that they have an unspecified
effect on the value returned by subsequent calls to basic_istream::gcount(). Each overload takes a
format string containing ordinary characters and flags which have special meaning. Each flag begins with a %.
Some flags can be modified by E or O. During parsing each flag interprets characters as parts of date and
time types according to Table 100. Some flags can be modified by a width parameter given as a positive
decimal integer called out as N below which governs how many characters are parsed from the stream in
interpreting the flag. All characters in the format string that are not represented in Table 100, except for
white space, are parsed unchanged from the stream. A white space character matches zero or more white
space characters in the input stream.

If the type being parsed cannot represent the information that the format flag refers to, is.setstate(ios_base::failbit)
is called. [Example: A duration cannot represent a weekday. — end example] However,
if a flag refers to a “time of day” (e.g. %H, %I, %p, etc.), then a specialization of duration is parsed as the
time of day elapsed since midnight.

If the from_stream overload fails to parse everything specified by the format string, or if insufficient
information is parsed to specify a complete duration, time point, or calendrical data structure,
setstate(ios_base::failbit) is called on the basic_istream.

Table 100: Meaning of parse flags  [tab:time.parse.spec]

<table>
<thead>
<tr>
<th>Flag</th>
<th>Parsed value</th>
</tr>
</thead>
<tbody>
<tr>
<td>%a</td>
<td>The locale’s full or abbreviated case-insensitive weekday name.</td>

<tr>
<td>%c</td>
<td>The locale’s date and time representation. The modified command %Ec interprets the locale’s alternate date and time representation.</td>
</tr>
<tr>
<td>%C</td>
<td>The century as a decimal number. The modified command %NC specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %EC interprets the locale’s alternative representation of the century.</td>
</tr>
<tr>
<td>%d</td>
<td>The day of the month as a decimal number. The modified command %Nd specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %Od interprets the locale’s alternative representation of the day of the month.</td>
</tr>
<tr>
<td>%D</td>
<td>Equivalent to %m/%d/%y.</td>
</tr>
<tr>
<td>%e</td>
<td>Equivalent to %d and can be modified like %d.</td>
</tr>
<tr>
<td>%F</td>
<td>Equivalent to %Y-%m-%d. If modified with a width N, the width is applied to only %Y.</td>
</tr>
<tr>
<td>%g</td>
<td>The last two decimal digits of the ISO week-based year. The modified command %Ng specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%G</td>
<td>The ISO week-based year as a decimal number. The modified command %NG specifies the maximum number of characters to read. If N is not specified, the default is 4. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%h</td>
<td>Equivalent to %b.</td>
</tr>
<tr>
<td>Flag</td>
<td>Parsed value</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>%H</td>
<td>The hour (24-hour clock) as a decimal number. The modified command %N%H specifies the maximum number of characters to read. If ( N ) is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %0H interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%I</td>
<td>The hour (12-hour clock) as a decimal number. The modified command %N%I specifies the maximum number of characters to read. If ( N ) is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %0I interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%j</td>
<td>If the type being parsed is a specialization of duration, a decimal number of days. Otherwise, the day of the year as a decimal number. Jan 1 is 1. In either case, the modified command %N%J specifies the maximum number of characters to read. If ( N ) is not specified, the default is 3. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%m</td>
<td>The month as a decimal number. Jan is 1. The modified command %N%m specifies the maximum number of characters to read. If ( N ) is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %0m interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%M</td>
<td>The minutes as a decimal number. The modified command %N%M specifies the maximum number of characters to read. If ( N ) is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %0M interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%n</td>
<td>Matches one white space character. [Note: %n, %t, and a space can be combined to match a wide range of white-space patterns. For example, &quot;%n\ &quot; matches one or more white space characters, and &quot;%n%t%t&quot; matches one to three white space characters. — end note]</td>
</tr>
<tr>
<td>%P</td>
<td>The locale’s equivalent of the AM/PM designations associated with a 12-hour clock.</td>
</tr>
<tr>
<td>%r</td>
<td>The locale’s 12-hour clock time.</td>
</tr>
<tr>
<td>%R</td>
<td>Equivalent to %H:%M.</td>
</tr>
<tr>
<td>%s</td>
<td>The seconds as a decimal number. The modified command %N%S specifies the maximum number of characters to read. If ( N ) is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a long double in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command %0S interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%t</td>
<td>Matches zero or one white space characters.</td>
</tr>
<tr>
<td>%T</td>
<td>Equivalent to %H:%M:%S.</td>
</tr>
<tr>
<td>%u</td>
<td>The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command %N%u specifies the maximum number of characters to read. If ( N ) is not specified, the default is 1. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%U</td>
<td>The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command %N%U specifies the maximum number of characters to read. If ( N ) is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %0U interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%V</td>
<td>The ISO week-based week number as a decimal number. The modified command %N%V specifies the maximum number of characters to read. If ( N ) is not specified, the default is 2. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%W</td>
<td>The weekday as a decimal number (0-6), where Sunday is 0. The modified command %N%W specifies the maximum number of characters to read. If ( N ) is not specified, the default is 1. Leading zeroes are permitted but not required. The modified command %0W interprets the locale’s alternative representation.</td>

28 Localization library

28.1 General

This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.

The following subclauses describe components for locales themselves, the standard facets, and facilities from the ISO C library, as summarized in Table 101.

<table>
<thead>
<tr>
<th>Subclause</th>
<th>Header</th>
</tr>
</thead>
<tbody>
<tr>

class money_put;

// 28.4.7, message retrieval
class messages_base;
template<class charT> class messages;
template<class charT> class messages_byname;
}

The header `<locale>` defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.256

### 28.3 Locales

#### 28.3.1 Class locale

namespace std {
    class locale {
        public:
            // types
            class facet;
            class id;
            using category = int;
            static const category none = 0,
                collate = 0x010, ctype = 0x020,
                monetary = 0x040, numeric = 0x080,
                time = 0x100, messages = 0x200,
                all = collate | ctype | monetary | numeric | time | messages;

            // construct/copy/destroy
            locale() noexcept;
            locale(const locale& other) noexcept;
            explicit locale(const char* std_name);
            explicit locale(const string& std_name);
            locale(const locale& other, const char* std_name, category);
            locale(const locale& other, const string& std_name, category);
            template<class Facet> locale(const locale& other, Facet* f);

256) In this subclause, the type name `struct tm` is an incomplete type that is defined in `<ctime>` (27.14).
locale(const locale& other, const locale& one, category);
~locale(); // not virtual
const locale& operator=(const locale& other) noexcept;
template<class Facet> locale combine(const locale& other) const;

// locale operations
string name() const;

bool operator==(const locale& other) const;

// locale operations
template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1,
const basic_string<charT, traits, Allocator>& s2) const;

// global locale objects
static locale global(const locale&);
static const locale& classic();

Class locale implements a type-safe polymorphic set of facets, indexed by facet type. In other words, a facet has a dual role: in one sense, it’s just a class interface; at the same time, it’s an index into a locale’s set of facets.

Access to the facets of a locale is via two function templates, use_facet<> and has_facet<>.

[Example: An iostream operator<< might be implemented as:

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& s, Date d) {
    typename basic_ostream<charT, traits>::sentry cerberos(s);
    if (cerberos) {
        tm tmbuf; d.extract(tmbuf);
        bool failed =
        use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(s.getloc()).put(s, s, s.fill(), &tmbuf, 'x').failed();
        if (failed)
            s.setstate(s.badbit); // might throw
    }
    return s;
}
```
— end example]

In the call to use_facet<Facet>(loc), the type argument chooses a facet, making available all members of the named type. If Facet is not present in a locale, it throws the standard exception bad_cast. A C++ program can check if a locale implements a particular facet with the function template has_facet<Facet>(). User-defined facets may be installed in a locale, and used identically as may standard facets.

[Note: All locale semantics are accessed via use_facet<> and has_facet<>], except that:

(5.1) — A member operator template operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&) is provided so that a locale may be used as a predicate argument to the standard collections, to collate strings.

(5.2) — Convenient global interfaces are provided for traditional ctype functions such as isdigit() and isspace(), so that given a locale object loc a C++ program can call isspace(c, loc). (This eases upgrading existing extractors (29.7.4.2).)

— end note]

Once a facet reference is obtained from a locale object by calling use_facet<> that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.

257) Note that in the call to put, the stream is implicitly converted to an ostreambuf_iterator<charT, traits>.
In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.

A locale constructed from a name string (such as "POSIX"), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string "*".

Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (16.5.5.10).

### 28.3.1.1 Types

#### 28.3.1.1.1 Type `locale::category`

```cpp
using category = int;
```

Valid category values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is true, and represents the union of all categories. Further, the expression `(X | Y)`, where `X` and `Y` each represent a single category, represents the union of the two categories.

</tr>
</tbody>
</table>

For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 102, `has_facet<Facet>(loc)` is true. Each `locale` member function which takes a `locale::category` argument operates on the corresponding set of facets.

An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 103.

The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<F>(1)` only for facet `F` of types `numpunct<charT>` and `ctype<charT>`, and for locale `l` the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.

In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that meet the `Cpp17InputIterator` requirements or

_Cpp17OutputIterator_ requirements, respectively (23.3). A template parameter with name `C` represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a bool parameter.

### 28.3.1.1.2 Class locale::facet

```cpp
namespace std {
    class locale::facet {
        protected:
            explicit facet(size_t refs = 0);
            virtual ~facet();
            facet(const facet&) = delete;
            void operator=(const facet&) = delete;
        }
    }
}
```

1. Class `facet` is the base class for locale feature sets. A class is a `facet` if it is publicly derived from another facet, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:

   ```cpp
   static ::std::locale::id id;
   ``

2. Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is not a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.

3. The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.

4. Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are `explicit`, preventing their participation in automatic conversions.

---

258) This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.
For some standard facets a standard "...byname" class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no "...byname" version of a facet, the base class implements named locale semantics itself by reference to other facets.

### 28.3.1.1.3 Class `locale::id`

```cpp
namespace std {
    class locale::id {
        public:
            id();
            void operator=(const id&) = delete;
            id(const id&) = delete;
    };
}
```

The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.

### 28.3.1.2 Constructors and destructor

```cpp
locale() noexcept;
```

**Effects:** Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.

**Note:** This constructor yields a copy of the current global locale. It is commonly used as a default argument for function parameters of type `const locale&`.

```cpp
explicit locale(const char* std_name);
```

**Effects:** Constructs a locale using standard C locale names, e.g., "POSIX". The resulting locale implements semantics defined to be associated with that name.

**Throws:** `runtime_error` if the argument is not valid, or is null.

**Remarks:** The set of valid string argument values is "C", "", and any implementation-defined values.

```cpp
explicit locale(const string& std_name);
```

**Effects:** The same as `locale(std_name.c_str())`.

```cpp
locale(const locale& other, const char* std_name, category);
```

**Effects:** Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

**Throws:** `runtime_error` if the argument is not valid, or is null.

**Remarks:** The locale has a name if and only if `other` has a name.

```cpp
locale(const locale& other, const string& std_name, category cat);
```

**Effects:** The same as `locale(other, std_name.c_str(), cat)`.

```cpp
template<class Facet> locale(const locale& other, Facet* f);
```

**Effects:** Constructs a locale incorporating all facets from the first argument except that of type `Facet`, and installs the second argument as the remaining facet. If `f` is null, the resulting object is a copy of `other`.

**Remarks:** The resulting locale has no name.
locale(const locale& other, const locale& one, category cats);

Effects: Constructs a locale incorporating all facets from the first argument except those that implement cats, which are instead incorporated from the second argument.

Remarks: The resulting locale has a name if and only if the first two arguments have names.

cost locale& operator=(const locale& other) noexcept;

Effects: Creates a copy of other, replacing the current value.

Returns: *this.

28.3.1.3 Members

```cpp
template<class Facet> locale combine(const locale& other) const;
```

Effects: Constructs a locale incorporating all facets from *this except for that one facet of other that is identified by Facet.

Returns: The newly created locale.

Throws: runtime_error if has_facet<Facet>(other) is false.

Remarks: The resulting locale has no name.

string name() const;

Returns: The name of *this, if it has one; otherwise, the string "*".

28.3.1.4 Operators

```cpp
bool operator==(const locale& other) const;
```

Returns: true if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; false otherwise.

```cpp
template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1, const basic_string<charT, traits, Allocator>& s2) const;
```

Effects: Compares two strings according to the collate<charT> facet.

Remarks: This member operator template (and therefore locale itself) meets the requirements for a comparator predicate template argument (Clause 25) applied to strings.

Returns:

use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(), s2.data(), s2.data() + s2.size()) < 0

Example: A vector of strings `v` can be collated according to collation rules in locale `loc` simply by (25.8.1, 22.3.11):

```cpp
std::sort(v.begin(), v.end(), loc);
```

—end example

28.3.1.5 Static members

```cpp
static locale global(const locale& loc);
```

Effects: Sets the global locale to its argument. Causes future calls to the constructor locale() to return a copy of the argument. If the argument has a name, does setlocale(LC_ALL, loc.name().c_str());

otherwise, the effect on the C locale, if any, is implementation-defined.

Remarks: No library function other than locale::global() affects the value returned by locale().

[Note: See 28.5 for data race considerations when setlocale is invoked. — end note]

Returns: The previous value of locale().
static const locale& classic();

The "C" locale.

Returns: A locale that implements the classic "C" locale semantics, equivalent to the value locale("C").

Remarks: This locale, its facets, and their member functions, do not change with time.

28.3.2 locale globals

template<class Facet> const Facet& use_facet(const locale& loc);

Mandates: Facet is a facet class whose definition contains the public static member id as defined in 28.3.1.1.2.

Returns: A reference to the corresponding facet of loc, if present.

Throws: bad_cast if has_facet<Facet>(loc) is false.

Remarks: The reference returned remains valid at least as long as any copy of loc exists.

template<class Facet> bool has_facet(const locale& loc) noexcept;

Returns: true if the facet requested is present in loc; otherwise false.

28.3.3 Convenience interfaces

28.3.3.1 Character classification

template<class charT> bool isspace (charT c, const locale& loc);

template<class charT> bool isprint (charT c, const locale& loc);

template<class charT> bool iscntrl (charT c, const locale& loc);

template<class charT> bool isupper (charT c, const locale& loc);

template<class charT> bool islower (charT c, const locale& loc);

template<class charT> bool isalpha (charT c, const locale& loc);

template<class charT> bool isdigit (charT c, const locale& loc);

template<class charT> bool ispunct (charT c, const locale& loc);

Each of these functions isF returns the result of the expression:

use_facet<ctype<charT>>(loc).is(ctype_base::F, c)

where F is the ctype_base::mask value corresponding to that function (28.4.1).259

28.3.3.2 Conversions

28.3.3.2.1 Character conversions

template<class charT> charT toupper(charT c, const locale& loc);

Returns: use_facet<ctype<charT>>(loc).toupper(c).

template<class charT> charT tolower(charT c, const locale& loc);

Returns: use_facet<ctype<charT>>(loc).tolower(c).

28.4 Standard locale categories

Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users’ iostream operators << and >>, as members put() and get(), respectively. Each such member function takes an ios_base& argument whose members flags(), precision(), and width(), specify the format of the corresponding datum (29.5.3). Those functions which need to use other facets call its member getloc() to retrieve the locale imbued there. Formatting facets use the character argument fill to fill out the specified width where necessary.

The put() members make no provision for error reporting. (Any failures of the OutputIterator argument can be extracted from the returned iterator.) The get() members take an ios_base::iostate& argument whose value they ignore, but set to ios_base::failbit in case of a parse error.

259) When used in a loop, it is faster to cache the ctype<> facet and use it directly, or use the vector form of ctype<>::is.
Within this clause it is unspecified whether one virtual function calls another virtual function.

### 28.4.1 The `ctype` category

```cpp
class ctype_base {
public:
    using mask = see below;

    // numeric values are for exposition only.
    static const mask space = 1 << 0;
    static const mask print = 1 << 1;
    static const mask cntrl = 1 << 2;
    static const mask upper = 1 << 3;
    static const mask lower = 1 << 4;
    static const mask alpha = 1 << 5;
    static const mask digit = 1 << 6;
    static const mask punct = 1 << 7;
    static const mask xdigit = 1 << 8;
    static const mask blank = 1 << 9;
    static const mask alnum = alpha | digit;
    static const mask graph = alnum | punct;
};
```

The type `mask` is a bitmask type (16.4.2.2.4).

### 28.4.1.1 Class template `ctype`

```cpp
namespace std {
    template<class charT>
    class ctype : public locale::facet, public ctype_base {
public:
    using char_type = charT;

    explicit ctype(size_t refs = 0);

    bool is(mask m, charT c) const;
    const charT* is(const charT* low, const charT* high, mask* vec) const;
    const charT* scan_is(mask m, const charT* low, const charT* high) const;
    const charT* scan_not(mask m, const charT* low, const charT* high) const;
    charT toupper(charT c) const;
    const charT* toupper(charT* low, const charT* high) const;
    charT tolower(charT c) const;
    const charT* tolower(charT* low, const charT* high) const;
    charT widen(char c) const;
    const char* widen(const char* low, const char* high, charT* to) const;
    char narrow(charT c, char dfault) const;
    const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

    static locale::id id;

protected:
    ~ctype();
    virtual bool do_is(mask m, charT c) const;
    virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
    virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
    virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
    virtual charT do_toupper(charT) const;
    virtual const charT* do_toupper(charT* low, const charT* high) const;
    virtual charT do_tolower(charT) const;
    virtual const charT* do_tolower(charT* low, const charT* high) const;
    virtual charT do_widen(char c) const;
    virtual const char* do_widen(const char* low, const char* high, charT* dest) const;
    virtual char do_narrow(charT, char dfault) const;
};
```
virtual const charT* do_narrow(const charT* low, const charT* high, char dfault, char* dest) const;
};

1 Class *ctype* encapsulates the C library `<cctype>` features. *istream* members are required to use *ctype<>* for character classing during input parsing.

The specializations required in Table 102 (28.3.1.1.1), namely *ctype<>* and *ctype<*>char_t*, implement character classing appropriate to the implementation’s native character set.

### 28.4.1.1.1 ctype members

#### bool is(mask m, charT c) const;

const charT* is(const charT* low, const charT* high, mask* vec) const;

1 *Returns*: do_is(m, c) or do_is(low, high, vec).

const charT* scan_is(mask m, const charT* low, const charT* high) const;

2 *Returns*: do_scan_is(m, low, high).

const charT* scan_not(mask m, const charT* low, const charT* high) const;

3 *Returns*: do_scan_not(m, low, high).

charT toupper(charT) const;

4 *Returns*: do_toupper(c) or do_toupper(low, high).

castT tolower(charT c) const;

5 *Returns*: do_tolower(c) or do_tolower(low, high).

charT widen(char c) const;

6 *Returns*: do_widen(c) or do_widen(low, high, to).

char narrow(charT c, char dfault) const;

7 *Returns*: do_narrow(c, dfault) or do_narrow(low, high, dfault, to).

### 28.4.1.1.2 ctype virtual functions

#### bool do_is(mask m, charT c) const;

con cast charT* do_is(const charT* low, const charT* high, mask* vec) const;

1 *Effects*: Classifies a character or sequence of characters. For each argument character, identifies a value M of type *ctype_base::mask*. The second form identifies a value M of type *ctype_base::mask* for each *p* where (*low* <= *p* && *p* < *high*), and places it into vec[*p* - *low*].

*Returns*: The first form returns the result of the expression (M & m) != 0; i.e., *true* if the character has the characteristics specified. The second form returns *high*.

const charT* do_scan_is(mask m, const charT* low, const charT* high) const;

2 *Effects*: Locates a character in a buffer that conforms to a classification m.

*Returns*: The smallest pointer *p* in the range [low, high) such that *is*(m, *p*) would return *true*; otherwise, returns *high*.

const charT* do_scan_not(mask m, const charT* low, const charT* high) const;

3 *Effects*: Locates a character in a buffer that fails to conform to a classification m.

*Returns*: The smallest pointer *p*, if any, in the range [low, high) such that *is*(m, *p*) would return *false*; otherwise, returns *high*.
charT do_toupper(charT c) const;
const charT* do_toupper(charT* low, const charT* high) const;

7 Effects: Converts a character or characters to upper case. The second form replaces each character *p in the range [low, high] for which a corresponding upper-case character exists, with that character.

Returns: The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns high.

charT do_tolower(charT c) const;
const charT* do_tolower(charT* low, const charT* high) const;

9 Effects: Converts a character or characters to lower case. The second form replaces each character *p in the range [low, high] and for which a corresponding lower-case character exists, with that character.

Returns: The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns high.

charT do_widen(char c) const;
const char* do_widen(const char* low, const char* high, charT* dest) const;

11 Effects: Applies the simplest reasonable transformation from a char value or sequence of char values to the corresponding charT value or values.\[260\] The only characters for which unique transformations are required are those in the basic source character set (5.3).

For any named ctype category with a ctype <charT> facet ctc and valid ctype_base::mask value M, (ctc.is(M, c) || !is(M, do_widen(c)) ) is true.\[261\]

The second form transforms each character *p in the range [low, high], placing the result in dest[p - low].

Returns: The first form returns the transformed value. The second form returns high.

char do_narrow(charT c, char dfault) const;
const charT* do_narrow(const charT* low, const charT* high, char dfault, charT* dest) const;

13 Effects: Applies the simplest reasonable transformation from a charT value or sequence of charT values to the corresponding char value or values.

For any character c in the basic source character set (5.3) the transformation is such that do_widen(do_narrow(c, 0)) == c

For any named ctype category with a ctype<char> facet ctc however, and ctype_base::mask value M,

(is(M, c) || !ctc.is(M, do_narrow(c, dfault)) )

is true (unless do_narrow returns dfault). In addition, for any digit character c, the expression (do_narrow(c, dfault) - '0') evaluates to the digit value of the character. The second form transforms each character *p in the range [low, high], placing the result (or dfault if no simple transformation is readily available) in dest[p - low].

Returns: The first form returns the transformed value; or dfault if no mapping is readily available. The second form returns high.

28.4.1.2 Class template ctype_byname

namespace std {

    template<class charT>
    class ctype_byname : public ctype<charT> {
public:
        using mask = typename ctype<charT>::mask;
        explicit ctype_byname(const char*, size_t refs = 0);
        explicit ctype_byname(const string&, size_t refs = 0);

        protected:
            ~ctype_byname();

    260\] The char argument of do_widen is intended to accept values derived from character-literals for conversion to the locale’s encoding.

261\] In other words, the transformed character is not a member of any character classification that c is not also a member of.
28.4.1.3 ctype<char> specialization

namespace std {
    template<>
    class ctype<char> : public locale::facet, public ctype_base {
        public:
            using char_type = char;

            explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);

            bool is(mask m, char c) const;
            const char* is(const char* low, const char* high, mask* vec) const;
            const char* scan_is (mask m, const char* low, const char* high) const;
            const char* scan_not(mask m, const char* low, const char* high) const;

            char toupper(char c) const;
            const char* toupper(char* low, const char* high) const;
            char tolower(char c) const;
            const char* tolower(char* low, const char* high) const;

            char widen(char c) const;
            const char* widen(const char* low, const char* high, char* to) const;

            char narrow(char c, char dfault) const;
            const char* narrow(const char* low, const char* high, char dfault, char* to) const;

            static locale::id id;
            static const size_t table_size = implementation-defined;

            const mask* table() const noexcept;
            static const mask* classic_table() noexcept;
    };
};

A specialization ctype<char> is provided so that the member functions on type char can be implemented inline. The implementation-defined value of member table_size is at least 256.

28.4.1.3.1 Destructor

~ctype();

Effects: If the constructor's first argument was nonzero, and its second argument was true, does delete [] table().

28.4.1.3.2 Members

In the following member descriptions, for unsigned char values v where v >= table_size, table()[v] is assumed to have an implementation-specific value (possibly different for each such value v) without performing the array lookup.

---

262) Only the char (not unsigned char and signed char) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for ctype<char>.
explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);

2  Preconditions: Either tbl == nullptr is true or (tbl, tbl+table_size) is a valid range.

3  Effects: Passes its refs argument to its base class constructor.

bool is(mask m, char c) const;
const char* is(const char* low, const char* high, mask* vec) const;

4  Effects: The second form, for all *p in the range [low, high), assigns into vec[p - low] the value
5   table()[(unsigned char)*p].

6  Returns: The first form returns table()[(unsigned char)c] & m; the second form returns high.

const char* scan_is(mask m, const char* low, const char* high) const;

7  Returns: The smallest p in the range [low, high) such that
8     table()[(unsigned char) *p] & m is true.

const char* scan_not(mask m, const char* low, const char* high) const;

9  Returns: The smallest p in the range [low, high) such that
10    table()[(unsigned char) *p] & m is false.

char toupper(char c) const;
const char* toupper(char* low, const char* high) const;

11  Returns: do_toupper(c) or do_toupper(low, high), respectively.

char tolower(char c) const;
const char* tolower(char* low, const char* high) const;

12  Returns: do_tolower(c) or do_tolower(low, high), respectively.

char widen(char c) const;
const char* widen(const char* low, const char* high, char* to) const;

13  Returns: do_widen(c) or do_widen(low, high, to), respectively.

char narrow(char c, char dfault) const;
const char* narrow(const char* low, const char* high, char dfault, char* to) const;

14  Returns: do_narrow(c, dfault) or do_narrow(low, high, dfault, to), respectively.

const mask* table() const noexcept;

15  Returns: The first constructor argument, if it was nonzero, otherwise classic_table().

28.4.1.3.3 Static members

static const mask* classic_table() noexcept;

1  Returns: A pointer to the initial element of an array of size table_size which represents the classifications of characters in the "C" locale.

28.4.1.3.4 Virtual functions

char do_toupper(char) const;
const char* do_toupper(char* low, const char* high) const;
char do_tolower(char) const;
const char* do_tolower(char* low, const char* high) const;

virtual char do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char do_narrow(char c, char dfault) const;
virtual const char* do_narrow(const char* low, const char* high, char dfault, char* to) const;

1 These functions are described identically as those members of the same name in the ctype class template (28.4.1.1.1).

§ 28.4.1.3.4  ©ISO/IEC 2020 – All rights reserved 1327
namespace std {
    class codecvt_base {
        public:
            enum result { ok, partial, error, noconv };
    };

    template<class internT, class externT, class stateT>
    class codecvt : public locale::facet, public codecvt_base {
        public:
            using intern_type = internT;
            using extern_type = externT;
            using state_type = stateT;

            explicit codecvt(size_t refs = 0);

            result out(
                stateT& state,
                const internT* from, const internT* from_end, const internT*& from_next,
                externT* to, externT* to_end, externT*& to_next) const;

            result unshift(
                stateT& state,
                externT* to, externT* to_end, externT*& to_next) const;

            result in(
                stateT& state,
                const externT* from, const externT* from_end, const externT*& from_next,
                internT* to, internT* to_end, internT*& to_next) const;

            int encoding() const noexcept;
            bool always_noconv() const noexcept;
            int length(stateT&, const externT* from, const externT* end, size_t max) const;
            int max_length() const noexcept;

            static locale::id id;
    };
}

1 The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as UTF-32 and EUC.

2 The `stateT` argument selects the pair of character encodings being mapped between.
The specializations required in Table 102 (28.3.1.1.1) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. The specialization `codecvt<char16_t, char8_t, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char8_t, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

### 28.4.1.4.1 Members

```
result out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;
```

**Returns:** `do_out(state, from, from_end, from_next, to, to_end, to_next)`

```
result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```

**Returns:** `do_unshift(state, to, to_end, to_next)`

```
result in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;
```

**Returns:** `do_in(state, from, from_end, from_next, to, to_end, to_next)`

```
int encoding() const noexcept;
```

**Returns:** `do_encoding()`

```
bool always_noconv() const noexcept;
```

**Returns:** `do_always_noconv()`

```
int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
```

**Returns:** `do_length(state, from, from_end, max)`

### 28.4.1.4.2 Virtual functions

```
result do_out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;
```

**Preconditions:** `(from <= from_end && to <= to_end)` is well-defined and true; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

**Effects:** Translates characters in the source range `(from, from_end)`, placing the results in sequential positions starting at destination `to`. Converts no more than `(from_end - from)` source elements, and stores no more than `(to_end - to)` destination elements.

Stops if it encounters a character it cannot convert. It always leaves the `from_next` and `to_next` pointers pointing one beyond the last element successfully converted. If returns `noconv`, `internT` and `externT` are the same type and the converted sequence is identical to the input sequence `(from, from_next)`. 

§ 28.4.1.4.2 © ISO/IEC 2020 – All rights reserved 1329
to_next is set equal to to, the value of state is unchanged, and there are no changes to the values in [to, to_end).

3 A codecvt facet that is used by basic_filebuf (29.9) shall have the property that if
do_out(state, from, from_end, from_next, to, to_end, to_next)
would return ok, where from != from_end, then
do_out(state, from, from + 1, from_next, to, to_end, to_next)
shall also return ok, and that if
do_in(state, from, from_end, from_next, to, to_end, to_next)
would return ok, where to != to_end, then
do_in(state, from, from + 1, from_next, to, to_end, to_next)
shall also return ok.263 [Note: As a result of operations on state, it can return ok or partial and set
from_next == from_end]

4 Remarks: Its operations on state are unspecified. [Note: This argument can be used, for example, to
maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek
offsets. —end note]

5 Returns: An enumeration value, as summarized in Table 104.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>completed the conversion</td>
</tr>
<tr>
<td>partial</td>
<td>not all source characters converted</td>
</tr>
<tr>
<td>error</td>
<td>encountered a character in [from, from_end] that it could not convert</td>
</tr>
<tr>
<td>noconv</td>
<td>internT and externT are the same type, and input sequence is identical to converted sequence</td>
</tr>
</tbody>
</table>

A return value of partial, if (from_next == from_end), indicates that either the destination sequence
has not absorbed all the available destination elements, or that additional source elements are needed
before another destination element can be produced.

result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

6 Preconditions: (to <= to_end) is well-defined and true; state is initialized, if at the beginning of a
sequence, or else is equal to the result of converting the preceding characters in the sequence.

7 Effects: Places characters starting at to that should be appended to terminate a sequence when the
current stateT is given by state.264 Stores no more than (to_end - to) destination elements, and
leaves the to_next pointer pointing one beyond the last element successfully stored.

8 Returns: An enumeration value, as summarized in Table 105.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>completed the sequence</td>
</tr>
<tr>
<td>partial</td>
<td>space for more than to_end - to destination elements was needed to terminate a sequence given the value of state</td>
</tr>
<tr>
<td>error</td>
<td>an unspecified error has occurred</td>
</tr>
<tr>
<td>noconv</td>
<td>no termination is needed for this state_type</td>
</tr>
</tbody>
</table>

263 Informally, this means that basic_filebuf assumes that the mappings from internal to external characters is 1 to N: a
codecvt facet that is used by basic_filebuf must be able to translate characters one internal character at a time.

264 Typically these will be characters to return the state to stateT().
int do_encoding() const noexcept;

Returns: -1 if the encoding of the externT sequence is state-dependent; else the constant number of externT characters needed to produce an internal character; or 0 if this number is not a constant.\(^{265}\)

bool do_always_noconv() const noexcept;

Returns: true if do_in() and do_out() return noconv for all valid argument values. codecvt<char, char, mbstate_t> returns true.

int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;

Preconditions: (from <= from_end) is well-defined and true; state is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

Effects: The effect on the state argument is as if it called do_in(state, from, from_end, from, to, to+max, to) for to pointing to a buffer of at least max elements.

Returns: (from_next-from) where from_next is the largest value in the range [from, from_end) such that the sequence of values in the range [from, from_next) represents max or fewer valid complete characters of type internT. The specialization codecvt<char, char, mbstate_t>, returns the lesser of max and (from_end-from).

int do_max_length() const noexcept;

Returns: The maximum value that do_length(state, from, from_end, 1) can return for any valid range [from, from_end) and stateT value state. The specialization codecvt<char, char, mbstate_t>::do_max_length() returns 1.

28.4.1.5 Class template codecvtbyname

namespace std {
  template<class internT, class externT, class stateT>
  class codecvtbyname : public codecvt<internT, externT, stateT> {
    public:
      explicit codecvtbyname(const char*, size_t refs = 0);
      explicit codecvtbyname(const string&, size_t refs = 0);
    protected:
      ~codecvtbyname();
    }
  }

28.4.2 The numeric category

The classes num_get<> and num_put<> handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.\(^{266}\)

All specifications of member functions for num_put and num_get in the subclauses of 28.4.2 only apply to the specializations required in Tables 102 and 103 (28.3.1.1.1), namely num_get<char>, num_get<wchar_t>, num_get<C, InputIterator>, num_get<char>, num_get<wchar_t>, and num_put<C, OutputIterator>. These specializations refer to the ios_base::argument for formatting specifications (28.4), and to its imbued locale for the numpunct<> facet to identify all numeric punctuation preferences, and also for the ctype<> facet to perform character classification.

Extractor and inserter members of the standard iostreams use num_get<> and num_put<> member functions for formatting and parsing numeric values (29.7.4.2.1, 29.7.5.2.1).

\(^{265}\) If encoding() yields -1, then more than max_length() externT elements may be consumed when producing a single internT character, and additional externT elements may appear at the end of a sequence after those that yield the final internT character.

\(^{266}\) Parsing "-1" correctly into, e.g., an unsigned short requires that the corresponding member get() at least extract the sign before delegating.
28.4.2.1 Class template num_get

namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;

            explicit num_get(size_t refs = 0);

            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, bool& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, unsigned short& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, unsigned int& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, unsigned long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, unsigned long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, float& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, long double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, void*& v) const;

            static locale::id id;

        protected:
            ~num_get();
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, bool& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, long& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, long long& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, unsigned short& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, unsigned int& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, unsigned long& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, unsigned long long& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, float& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, double& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, long double& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, void*& v) const;
    };
}

1 The facet num_get is used to parse numeric values from an input sequence such as an istream.
§ 28.4.2.1.2 Virtual functions

iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, void*& val) const;

1 Returns: do_get(in, end, str, err, val).

The details of this operation occur in three stages

(2.1) Stage 1: Determine a conversion specifier

(2.2) Stage 2: Extract characters from in and determine a corresponding char value for the format expected by the conversion specification determined in stage 1.

(2.3) Stage 3: Store results

The details of the stages are presented below.

Stage 1: The function initializes local variables via

fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 106. The table is ordered. That is, the first line whose condition is true applies.

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basefield == oct</td>
<td>%o</td>
</tr>
<tr>
<td>basefield == hex</td>
<td>%X</td>
</tr>
<tr>
<td>basefield == 0</td>
<td>%i</td>
</tr>
<tr>
<td>signed integral type</td>
<td>%d</td>
</tr>
<tr>
<td>unsigned integral type</td>
<td>%u</td>
</tr>
</tbody>
</table>

For conversions to a floating-point type the specifier is %g.

For conversions to void* the specifier is %p.

A length modifier is added to the conversion specification, if needed, as indicated in Table 107.

<table>
<thead>
<tr>
<th>Type</th>
<th>Length modifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>short</td>
<td>h</td>
</tr>
<tr>
<td>unsigned short</td>
<td>h</td>
</tr>
<tr>
<td>long</td>
<td>l</td>
</tr>
<tr>
<td>unsigned long</td>
<td>l</td>
</tr>
<tr>
<td>long long</td>
<td>ll</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>ll</td>
</tr>
<tr>
<td>double</td>
<td>l</td>
</tr>
<tr>
<td>long double</td>
<td>L</td>
</tr>
</tbody>
</table>

**Stage 2:** If in == end then stage 2 terminates. Otherwise a charT is taken from in and local variables are initialized as if by

```cpp
char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<numpunct<charT>>(loc).decimal_point())
c = '.';
bool discard =
    ct == use_facet<numpunct<charT>>(loc).thousands_sep()
    && use_facet<numpunct<charT>>(loc).grouping().length() != 0;
```

where the values src and atoms are defined as if by:

```cpp
static const char src[] = "0123456789abcdefABCD0EF+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);
```

For this value of loc.

If discard is true, then if '.' has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if '.' has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a check is made to determine if c is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then in is advanced by ++in and processing returns to the beginning of stage 2.

**Stage 3:** The sequence of chars accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header <cstdlib>:

- For a signed integer value, the function `strtoll`.
- For an unsigned integer value, the function `strtoull`.
- For a `float` value, the function `strtof`.
- For a `double` value, the function `strtod`.
- For a `long double` value, the function `strtold`.

§ 28.4.2.1.2 ©ISO/IEC 2020 – All rights reserved 1334
The numeric value to be stored can be one of:

- zero, if the conversion function does not convert the entire field.
- the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in \texttt{val}.
- the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in \texttt{val}.
- the converted value, otherwise.

The resultant numeric value is stored in \texttt{val}. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, \texttt{ios\_base::failbit} is assigned to \texttt{err}.

4 Digit grouping is checked. That is, the positions of discarded separators is examined for consistency with \texttt{use\_facet<numpunct<charT>>(loc).grouping()}. If they are not consistent then \texttt{ios\_base::failbit} is assigned to \texttt{err}.

In any case, if stage 2 processing was terminated by the test for \texttt{in == end} then \texttt{err |= ios\_base::eofbit} is performed.

\begin{verbatim}
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, bool& val) const;
\end{verbatim}

6 Effects: If \texttt{(str.flags()&ios\_base::boolalpha) == 0} then input proceeds as it would for a \texttt{long} except that if a value is being stored into \texttt{val}, the value is determined according to the following: If the value to be stored is 0 then \texttt{false} is stored. If the value is 1 then \texttt{true} is stored. Otherwise \texttt{true} is stored and \texttt{ios\_base::failbit} is assigned to \texttt{err}.

Otherwise target sequences are determined “as if” by calling the members \texttt{falsename()} and \texttt{truename()} of the facet obtained by \texttt{use\_facet<numpunct<charT>>(str.getloc())}. Successive characters in the range \texttt{[in, end)} (see 22.2.3) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator \texttt{in} is compared to \texttt{end} only when necessary to obtain a character. If a target sequence is uniquely matched, \texttt{val} is set to the corresponding value. Otherwise \texttt{false} is stored and \texttt{ios\_base::failbit} is assigned to \texttt{err}.

The \texttt{in} iterator is always left pointing one position beyond the last character successfully matched. If \texttt{val} is set, then \texttt{err} is set to \texttt{str.goodbit}; or to \texttt{str.eofbit} if, when seeking another character to match, it is found that \texttt{(in == end)}. If \texttt{val} is not set, then \texttt{err} is set to \texttt{str.failbit}; or to \texttt{(str.failbit|str.eofbit)} if the reason for the failure was that \texttt{(in == end)}. \texttt{Example}: For targets \texttt{true}: "a" and \texttt{false}: "abb", the input sequence "a" yields \texttt{val == true} and \texttt{err == str.eofbit}; the input sequence "abc" yields \texttt{err = str.failbit}, with \texttt{in} ending at the \texttt{c} element. For targets \texttt{true}: "1" and \texttt{false}: "0", the input sequence "1" yields \texttt{val == true} and \texttt{err == str.goodbit}. For empty targets (""), any input sequence yields \texttt{err == str.failbit}. \texttt{— end example}

8 Returns: \texttt{in}.

28.4.2.2 Class template \texttt{num\_put} [locale.nm.put]

\begin{verbatim}
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;
            explicit num_put(size_t refs = 0);

            iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

            static locale::id id;
        }
    }
\end{verbatim}
protected:
    ~num_put();
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
};

The facet num_put is used to format numeric values to a character sequence such as an ostream.

28.4.2.2.1 Members

iter_type put(iter_type out, ios_base& str, char_type fill, bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;

Returns: do_put(out, str, fill, val).

28.4.2.2.2 Virtual functions

iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;

Effects: Writes characters to the sequence out, formatting val as desired. In the following description, loc names a local variable initialized as

    locale loc = str.getloc();

The details of this operation occur in several stages:

(2.1) — Stage 1: Determine a printf conversion specifier spec and determine the characters that would be printed by printf (29.12) given this conversion specifier for

        printf(spec, val)

    assuming that the current locale is the "C" locale.

(2.2) — Stage 2: Adjust the representation by converting each char determined by stage 1 to a charT using a conversion and values returned by members of use_facet<numpunct<charT>>(loc).

(2.3) — Stage 3: Determine where padding is required.

(2.4) — Stage 4: Insert the sequence into the out.

Detailed descriptions of each stage follow.

Returns: out.

Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

    fmtflags flags = str.flags();
    fmtflags basefield = (flags & (ios_base::basefield));
    fmtflags uppercase = (flags & (ios_base::uppercase));
    fmtflags floatfield = (flags & (ios_base::floatfield));
    fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));
fmtflags showpoint = (flags & (ios_base::showpoint));

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 108.

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basefield == ios_base::oct</td>
<td>%o</td>
</tr>
<tr>
<td>(basefield == ios_base::hex) &amp;&amp; !uppercase</td>
<td>%x</td>
</tr>
<tr>
<td>(basefield == ios_base::hex)</td>
<td>%X</td>
</tr>
<tr>
<td>for a signed integral type</td>
<td>%d</td>
</tr>
<tr>
<td>for an unsigned integral type</td>
<td>%u</td>
</tr>
</tbody>
</table>

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 109.

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>floatfield == ios_base::fixed</td>
<td>%f</td>
</tr>
<tr>
<td>floatfield == ios_base::scientific &amp;&amp; !uppercase</td>
<td>%e</td>
</tr>
<tr>
<td>floatfield == ios_base::scientific</td>
<td>%E</td>
</tr>
<tr>
<td>floatfield == (ios_base::fixed</td>
<td>ios_base::scientific) &amp;&amp; !uppercase</td>
</tr>
<tr>
<td>floatfield == (ios_base::fixed</td>
<td>ios_base::scientific)</td>
</tr>
<tr>
<td>!uppercase</td>
<td>%g</td>
</tr>
<tr>
<td>otherwise</td>
<td>%G</td>
</tr>
</tbody>
</table>

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 110.

<table>
<thead>
<tr>
<th>Type</th>
<th>Length modifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>long</td>
<td>l</td>
</tr>
<tr>
<td>long long</td>
<td>ll</td>
</tr>
<tr>
<td>unsigned long</td>
<td>l</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>ll</td>
</tr>
<tr>
<td>long double</td>
<td>L</td>
</tr>
<tr>
<td>otherwise</td>
<td>none</td>
</tr>
</tbody>
</table>

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 111.

<table>
<thead>
<tr>
<th>Type(s)</th>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>an integral type</td>
<td>showpos</td>
<td>+</td>
</tr>
<tr>
<td></td>
<td>showbase</td>
<td>#</td>
</tr>
<tr>
<td>a floating-point type</td>
<td>showpos</td>
<td>+</td>
</tr>
<tr>
<td></td>
<td>showpoint</td>
<td>#</td>
</tr>
</tbody>
</table>

For conversion from a floating-point type, if floatfield != (ios_base::fixed | ios_base::scientific), str.precision() is specified as precision in the conversion specification. Otherwise, no precision is specified.
For conversion from `void*` the specifier is `%p`.
The representations at the end of stage 1 consists of the `char`'s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

**Stage 2:** Any character `c` other than a decimal point(.) is converted to a `charT` via

```cpp
use_facet<ctype<charT>>(loc).widen(c)
```

A local variable `punct` is initialized via

```cpp
const numbunct<charT>& punct = use_facet<numbunct<charT>>(loc);
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in 28.4.3.1.2

Decimal point characters(.) are replaced by `punct.decimal_point()`

**Stage 3:** A local variable is initialized as

```cpp
fmtflags adjustfield = (flags & (ios_base::adjustfield));
```

The location of any padding is determined according to Table 112.

<table>
<thead>
<tr>
<th>State</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjustfield == ios_base::left</td>
<td>pad after</td>
</tr>
<tr>
<td>adjustfield == ios_base::right</td>
<td>pad before</td>
</tr>
<tr>
<td>adjustfield == internal and a sign occurs in the representation</td>
<td>pad after the sign</td>
</tr>
<tr>
<td>adjustfield == internal and representation after stage 1 began with 0x or 0X</td>
<td>pad after x or X</td>
</tr>
<tr>
<td>otherwise</td>
<td>pad before</td>
</tr>
</tbody>
</table>

If `str.width()` is nonzero and the number of `charT`'s in the sequence after stage 2 is less than `str.width()`, then enough fill characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

**Stage 4:** The sequence of `charT`'s at the end of stage 3 are output via

```cpp
*out++ = c
```

Returns: If `(str.flags() & ios_base::boolalpha) == 0` returns `do_put(out, str, fill, (int)val)`, otherwise obtains a string `s` as if by

```cpp
string_type s = val ? use_facet<numpunct<charT>>(loc).truename() : use_facet<numpunct<charT>>(loc).falsename();
```

and then inserts each character `c` of `s` into `out` via `*out++ = c` and returns `out`.

### 28.4.3 The numeric punctuation facet

28.4.3.1 Class template `numpunct`

```cpp
namespace std {
    template<class charT>
    class numpunct : public locale::facet {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;

        explicit numpunct(size_t refs = 0);  
        char_type decimal_point() const;    
        char_type thousands_sep() const;   
        string grouping() const;          
        string_type truename() const;      
        string_type falsename() const;     
    }
}
```

267) The conversion specification `#o` generates a leading 0 which is not a padding character.
numpunct<> specifies numeric punctuation. The specializations required in Table 102 (28.3.1.1.1), namely numpunct<wchar_t> and numpunct<char>, provide classic "C" numeric formats, i.e., they contain information equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to widen.

The syntax for number formats is as follows, where digit represents the radix set specified by the fmtflags argument value, and thousands-sep and decimal-point are the results of corresponding numpunct<charT> members. Integer values have the format:

```
intval:
  sign_opt units
  sign:
  +
  -
  units:
  digits
  digits thousands-sep units
  digits:
  digit digits_opt
```

and floating-point values have:

```
floatval:
  sign_opt units fractional_opt exponent_opt
  sign_opt decimal-point digits exponent_opt
  fractional:
  decimal-point digits_opt
  exponent:
  e sign_opt digits
  e:
  e
  E
```

where the number of digits between thousands-seps is as specified by do_grouping(). For parsing, if the digits portion contains no thousands-separators, no grouping constraint is applied.

28.4.3.1.1 Members

```cpp
char_type decimal_point() const;
Returns: do_decimal_point().
```

```cpp
char_type thousands_sep() const;
Returns: do_thousands_sep().
```

```cpp
string grouping() const;
Returns: do_grouping().
```

```cpp
string_type truename() const;
string_type falsename() const;
Returns: do_truename() or do_falsename(), respectively.
```
28.4.3.1.2 Virtual functions

char_type do_decimal_point() const;

Returns: A character for use as the decimal radix separator. The required specializations return '.' or L'.'.

char_type do_thousands_sep() const;

Returns: A character for use as the digit group separator. The required specializations return ',' or L','.

string do_grouping() const;

Returns: A string used as a vector of integer values, in which each element vec[i] represents the number of digits in the group at position i, starting with position 0 as the rightmost group. If vec.size() <= i, the number is the same as group (i - 1); if i < 0 || vec[i] <= 0 || vec[i] == CHAR_MAX, the size of the digit group is unlimited.

The required specializations return the empty string, indicating no grouping.

string_type do_truename() const;
string_type do_falsename() const;

Returns: A string representing the name of the boolean value true or false, respectively.

In the base class implementation these names are "true" and "false", or L"true" and L"false".

28.4.3.2 Class template numpunct_byname

namespace std {
  template<class charT>
  class numpunct_byname : public numpunct<charT> {
    // this class is specialized for char and wchar_t.
    public:
      using char_type = charT;
      using string_type = basic_string<charT>;

      explicit numpunct_byname(const char*, size_t refs = 0);
      explicit numpunct_byname(const string&, size_t refs = 0);

      protected:
        ~numpunct_byname();
    };
  }
}

28.4.4 The collate category

28.4.4.1 Class template collate

namespace std {
  template<class charT>
  class collate : public locale::facet {
    public:
      using char_type = charT;
      using string_type = basic_string<charT>;

      explicit collate(size_t refs = 0);

      int compare(const charT* low1, const charT* high1,
                  const charT* low2, const charT* high2) const;
      string_type transform(const charT* low, const charT* high) const;
      long hash(const charT* low, const charT* high) const;

      static locale::id id;
  }
}

268) Thus, the string "\003" specifies groups of 3 digits each, and "3" probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of "3".
The class `collate<charT>` provides features for use in the collation (comparison) and hashing of strings. A locale member function template, `operator()`, uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms (Clause 25) and containers operating on strings. The specializations required in Table 102 (28.3.1.1.1), namely `collate<char>` and `collate<wchar_t>`, apply lexicographic ordering (25.8.10).

Each function compares a string of characters `*p` in the range `[low, high)`.

### Class template `collate_byname`  

```cpp
namespace std {
    template<class charT>
    class collate_byname : public collate<charT> {
        public:
            using string_type = basic_string<charT>;

            explicit collate_byname(const char*, size_t refs = 0);
            explicit collate_byname(const string&, size_t refs = 0);
        }
    }
```

(269) This function is useful when one string is being compared to many other strings.
protected:
-~collate_byname();
};

28.4.5 The time category

Templates time_get<charT, InputIterator> and time_put<charT, OutputIterator> provide date and time formatting and parsing. All specifications of member functions for time_put and time_get in the subclauses of 28.4.5 only apply to the specializations required in Tables 102 and 103 (28.3.1.1.1). Their members use their ios_base&, ios_base::iostate& and fill arguments as described in 28.4, and the ctype<> facet, to determine formatting details.

28.4.5.1 Class template time_get

namespace std {
    class time_base {
    public:
        enum dateorder { no_order, dmy, mdy, ymd, ydm };
    }

template<class charT, class InputIterator = istreambuf_iterator<charT>>
class time_get : public locale::facet, public time_base {
    public:
        using char_type = charT;
        using iter_type = InputIterator;
        explicit time_get(size_t refs = 0);

        dateorder date_order() const { return do_date_order(); }
        iter_type get_time(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
        iter_type get_date(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
        iter_type get_weekday(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
        iter_type get_monthname(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
        iter_type get_year(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
        iter_type get(iter_type s, iter_type end, ios_base& f,
                      const char_type* fmt, const char_type* fmtend) const;

        static locale::id id;
    protected:
        ~time_get();
        virtual dateorder do_date_order() const;
        virtual iter_type do_get_time(iter_type s, iter_type end, ios_base& f,
                                       ios_base::iostate& err, tm* t) const;
        virtual iter_type do_get_date(iter_type s, iter_type end, ios_base& f,
                                       ios_base::iostate& err, tm* t) const;
        virtual iter_type do_get_weekday(iter_type s, iter_type end, ios_base& f,
                                           ios_base::iostate& err, tm* t) const;
        virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base& f,
                                            ios_base::iostate& err, tm* t) const;
        virtual iter_type do_get_year(iter_type s, iter_type end, ios_base& f,
                                       ios_base::iostate& err, tm* t) const;
        virtual iter_type do_get(iter_type s, iter_type end, ios_base& f,
                                  ios_base::iostate& err, tm* t, char format, char modifier) const;
    }
}
time_get is used to parse a character sequence, extracting components of a time or date into a struct tm object. Each get member parses a format as produced by a corresponding format specifier to time_put::put. If the sequence being parsed matches the correct format, the corresponding members of the struct tm argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.\(^\text{270}\)

If the end iterator is reached during parsing by any of the get() member functions, the member sets ios_base::eofbit in err.

28.4.5.1.1 Members

```cpp
    dateorder date_order() const;
    Returns: do_date_order().

    iter_type get_time(iter_type s, iter_type end, ios_base& str,
                       ios_base::iostate& err, tm* t) const;
    Returns: do_get_time(s, end, str, err, t).

    iter_type get_date(iter_type s, iter_type end, ios_base& str,
                       ios_base::iostate& err, tm* t) const;
    Returns: do_get_date(s, end, str, err, t).

    iter_type get_weekday(iter_type s, iter_type end, ios_base& str,
                          ios_base::iostate& err, tm* t) const;
    iter_type get_monthname(iter_type s, iter_type end, ios_base& str,
                            ios_base::iostate& err, tm* t) const;
    Returns: do_get_weekday(s, end, str, err, t) or do_get_monthname(s, end, str, err, t).

    iter_type get_year(iter_type s, iter_type end, ios_base& str,
                       ios_base::iostate& err, tm* t) const;
    Returns: do_get_year(s, end, str, err, t).

    iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
                  tm* t, char format, char modifier = 0) const;
    Returns: do_get(s, end, f, err, t, format, modifier).

    iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
                  tm* t, const char_type* fmt, const char_type* fmtend) const;
    Preconditions: [fmt, fmtend) is a valid range.
    Effects: The function starts by evaluating err = ios_base::goodbit. It then enters a loop, reading zero or more characters from s at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

    (8.1) The expression fmt == fmtend evaluates to true.
    (8.2) The expression err == ios_base::goodbit evaluates to false.
    (8.3) The expression s == end evaluates to true, in which case the function evaluates err = ios_base::eofbit | ios_base::failbit.
    (8.4) The next element of fmt is equal to '%', optionally followed by a modifier character, followed by a conversion specifier character, format, together forming a conversion specification valid for the ISO/IEC 9945 function strftime. If the number of elements in the range [fmt, fmtend) is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates err = ios_base::failbit. Otherwise, the function evaluates s = do_get(s, end, f, err, t, format, modifier), where the value of modifier is '0' when the optional modifier is absent from the conversion specification. If err == ios_base::goodbit holds after the evaluation of the expression, the function increments fmt to point just past the end of the conversion specification and continues looping.
```

\(^{270}\) In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.
ISO/IEC JTC1 SC22 WG21 N4860

(8.5) The expression `isspace(*fmt, f.getloc())` evaluates to `true`, in which case the function first increments `fmt` until `fmt == fmtend || !isspace(*fmt, f.getloc())` evaluates to `true`, then advances `s` until `s == end || !isspace(*s, f.getloc())` is `true`, and finally resumes looping.

(8.6) The next character read from `s` matches the element pointed to by `fmt` in a case-insensitive comparison, in which case the function evaluates `++fmt, ++s` and continues looping. Otherwise, the function evaluates `err = ios_base::failbit`.

[Note: The function uses the `ctype<charT>` facet installed in `f`'s locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so. — end note]

Returns: `s`.

28.4.5.1.2 Virtual functions

```
28.4.5.1.2 Virtual functions
[locale.time.get.virtuals]
```

dateorder do_date_order() const;

1 Returns: An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.\footnote{271} Returns `no_order` if the date format specified by `'x'` contains other variable components (e.g., Julian day, week number, week day).

```
iter_type do_get_time(iter_type s, iter_type end, ios_base& str, ios_base::iostate& err, tm* t) const;
```

2 Effects: Reads characters starting at `s` until it has extracted those `struct tm` members, and remaining format characters, used by `time_put<T>::put` to produce the format specified by `"%H:%M:%S"`, or until it encounters an error or end of sequence.

3 Returns: An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

```
iter_type do_get_date(iter_type s, iter_type end, ios_base& str, ios_base::iostate& err, tm* t) const;
```

4 Effects: Reads characters starting at `s` until it has extracted those `struct tm` members and remaining format characters used by `time_put<T>::put` to produce one of the following formats, or until it encounters an error. The format depends on the value returned by `date_order()` as shown in Table 113.

```
Table 113: do_get_date effects
[tab:locale.time.get.dogetdate]
```

<table>
<thead>
<tr>
<th>date_order()</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_order</td>
<td>&quot;%m%d%y&quot;</td>
</tr>
<tr>
<td>dmy</td>
<td>&quot;%d%m%y&quot;</td>
</tr>
<tr>
<td>mdy</td>
<td>&quot;%m%d%y&quot;</td>
</tr>
<tr>
<td>ymd</td>
<td>&quot;%y%m%d&quot;</td>
</tr>
<tr>
<td>ydm</td>
<td>&quot;%y%d%m&quot;</td>
</tr>
</tbody>
</table>

5 An implementation may also accept additional implementation-defined formats.

6 Returns: An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

```
iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str, ios_base::iostate& err, tm* t) const;
```

7 Effects: Reads characters starting at `s` until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that could match a full name, it continues reading until it matches the full name or fails. It sets the appropriate `struct tm` member accordingly.

8 Returns: An iterator pointing immediately beyond the last character recognized as part of a valid name.

\footnote{271} This function is intended as a convenience only, for common formats, and may return `no_order` in valid locales.
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
   ios_base::iostate& err, tm* t) const;

**Effects:** Reads characters starting at s until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the t->tm_year member accordingly.

**Returns:** An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

iter_type do_get(iter_type s, iter_type end, ios_base& f,
   ios_base::iostate& err, tm* t, char format, char modifier) const;

**Preconditions:** t points to an object.

**Effects:** The function starts by evaluating err = ios_base::goodbit. It then reads characters starting at s until it encounters an error, or until it has extracted and assigned those struct tm members, and any remaining format characters, corresponding to a conversion directive appropriate for the ISO/IEC 9945 function strftime, formed by concatenating '%', the modifier character, when non-NUL, and the format character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by t unchanged and evaluates err |= ios_base::failbit. When s == end evaluates to true after reading a character the function evaluates err |= ios_base::eofbit.

For complex conversion directives such as %c, %x, or %X, or directives that involve the optional modifiers E or O, when the function is unable to unambiguously determine some or all struct tm members from the input sequence [s, end], it evaluates err |= ios_base::eofbit. In such cases the values of those struct tm members are unspecified and may be outside their valid range.

**Remarks:** It is unspecified whether multiple calls to do_get() with the address of the same struct tm object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

**Returns:** An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given format and modifier.

### § 28.4.5.2 Class template time_getbyname

```cpp
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_getbyname : public time_get<charT, InputIterator> {
        public:
            using dateorder = time_base::dateorder;
            using iter_type = InputIterator;

            explicit time_getbyname(const char*, size_t refs = 0);
            explicit time_getbyname(const string&, size_t refs = 0);

            protected:
                ~time_getbyname();
            
    };
}
```

### § 28.4.5.3 Class template time_put

```cpp
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit time_put(size_t refs = 0);

            // the following is implemented in terms of other member functions.
            iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
                    const charT* pattern, const charT* pat_end) const;
            iter_type put(iter_type s, ios_base& f, char_type fill,
                    const tm* tmb, char format, char modifier = 0) const;
}
```
static locale::id id;

protected:
-~time_put();
virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
  char format, char modifier) const;
};

28.4.5.3.1 Members

iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
  const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
  char format, char modifier = 0) const;

Effects: The first form steps through the sequence from pattern to pat_end, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to s immediately, and each format sequence, as it is identified, results in a call to do_put; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character c to a char value as if by ct.narrow(c, 0), where ct is a reference to ctype<charT> obtained from str.getloc(). The first character of each sequence is equal to '%', followed by an optional modifier character mod and a format specifier character spec as defined for the function strftime. If no modifier character is present, mod is zero. For each valid format sequence identified, calls do_put(s, str, fill, t, spec, mod).

The second form calls do_put(s, str, fill, t, format, modifier).

[Note: The fill argument may be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. —end note]

Returns: An iterator pointing immediately after the last character produced.

28.4.5.3.2 Virtual functions

iter_type do_put(iter_type s, ios_base& str, char_type fill, const tm* t,
  char format, char modifier) const;

Effects: Formats the contents of the parameter t into characters placed on the output sequence s. Formatting is controlled by the parameters format and modifier, interpreted identically as the format specifiers in the string argument to the standard library function strftime(), except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.

Returns: An iterator pointing immediately after the last character produced. [Note: The fill argument may be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. —end note]

28.4.5.4 Class template time_put_byname

namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
  class time_put_byname : public time_put<charT, OutputIterator> {
  public:
    using char_type = charT;
    using iter_type = OutputIterator;

    explicit time_put_byname(const char*, size_t refs = 0);
    explicit time_put_byname(const string&, size_t refs = 0);

    protected:
    -time_put_byname();
  }
}

272) Although the C programming language defines no modifiers, most vendors do.
273) Interpretation of the modifier argument is implementation-defined, but should follow POSIX conventions.
274) Implementations should refer to other standards such as POSIX for these definitions.
28.4.6 The monetary category

These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.

All specifications of member functions for `money_put` and `money_get` in the subclauses of 28.4.6 only apply to the specializations required in Tables 102 and 103 (28.3.1.1.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 28.4, and the `moneypunct<>` and `ctype<>` facets, to determine formatting details.

28.4.6.1 Class template money_get

```cpp
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class money_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;
            using string_type = basic_string<charT>;

            explicit money_get(size_t refs = 0);

            iter_type get(iter_type s, iter_type end, bool intl,
                          ios_base& f, ios_base::iostate& err,
                          long double& units) const;
            iter_type get(iter_type s, iter_type end, bool intl,
                          ios_base& f, ios_base::iostate& err,
                          string_type& digits) const;

            static locale::id id;

        protected:
            ~money_get();
            virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                                      ios_base::iostate& err, long double& units) const;
            virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                                      ios_base::iostate& err, string_type& digits) const;
    }
}
```

28.4.6.1.1 Members

```cpp
iter_type get(iter_type s, iter_type end, bool intl,
              ios_base& f, ios_base::iostate& err,
              long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl,
              ios_base& f, ios_base::iostate& err,
              string_type& quant) const;
```

Returns: `do_get(s, end, intl, f, err, quant)`.

28.4.6.1.2 Virtual functions

```cpp
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, string_type& digits) const;
```

Effects: Reads characters from `s` to parse and construct a monetary value according to the format specified by a `moneypunct<charT, Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()` and `str.flags()`.

If a valid sequence is recognized, does not change `err`; otherwise, sets `err` to `(err|str.failbit)`, or `(err|str.failbit|str.eofbit)` if no more characters are available, and does not change `units` or `digits`. Uses the pattern returned by `mp.neg_format()` to parse all values. The result is returned as an integral value stored in `units` or as a sequence of digits possibly preceded by a minus sign (as produced by `ct.widen(c)` where `c` is '-' or in the range from '0' through '9' (inclusive)) stored in `digits`. [Example: The sequence $1,056.23 in a common United States locale would yield, for `units`, 105623, or, for `digits`, "105623". — end example] If `mp.grouping()` indicates that no thousands
separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

Where `money_base::space` or `money_base::none` appears as the last element in the format pattern, no white space is consumed. Otherwise, where `money_base::space` appears in any of the initial elements of the format pattern, at least one white space character is required. Where `money_base::none` appears in any of the initial elements of the format pattern, white space is allowed but not required. If `(str.flags() & str.showbase)` is `false`, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.

If the first character (if any) in the string `pos` returned by `mp.positive_sign()` or the string `neg` returned by `mp.negative_sign()` is recognized in the position indicated by `sign` in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components. [Example: If `showbase` is off, then for a `neg` value of "()" and a currency symbol of "L", in "(100 L)" the "L" is consumed; but if `neg` is "-", the "L" in "-100 L" is not consumed. —end example] If `pos` or `neg` is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of `pos` or `neg`, and the result is given the corresponding sign. If the first character of `pos` is equal to the first character of `neg`, or if both strings are empty, the result is given a positive sign.

Digits in the numeric monetary component are extracted and placed in `digits`, or into a character buffer `buf1` for conversion to produce a value for `units`, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value `units` is produced as if by

```c
for (int i = 0; i < n; ++i)
    buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where `n` is the number of characters placed in `buf1`, `buf2` is a character buffer, and the values `src` and `atoms` are defined as if by

```c
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

Returns: An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

#### 28.4.6.2 Class template money_put

```c
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class money_put : public locale::facet {
    public:
        using char_type = charT;
        using iter_type = OutputIterator;
        using string_type = basic_string<charT>;

        explicit money_put(size_t refs = 0);

        iter_type put(iter_type s, bool intl, ios_base& f,
                      char_type fill, long double units) const;
        iter_type put(iter_type s, bool intl, ios_base& f,
                      char_type fill, const string_type& digits) const;

        static locale::id id;

    protected:
        ~money_put();
        virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                      long double units) const;
    }
```
virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill, const string_type& digits) const;
};

28.4.6.2.1 Members

iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;

Returns: do_put(s, intl, f, loc, quant).

28.4.6.2.2 Virtual functions

iter_type do_put(iter_type s, bool intl, ios_base& str, char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str, char_type fill, const string_type& digits) const;

Effects: Writes characters to s according to the format specified by a moneypunct<CharT, Intl> facet reference mp and the character mapping specified by a ctype<CharT> facet reference ct obtained from the locale returned by str.getloc(), and str.flags(). The argument units is transformed into a sequence of wide characters as if by
c.t widen(buf1, buf1 + sprintf(buf1, "%.0Lf", units), buf2)
for character buffers buf1 and buf2. If the first character in digits or buf2 is equal to c.t widen(’-’), then the pattern used for formatting is the result of mp.neg_format(); otherwise the pattern is the result of mp.pos_format(). Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in
digits or buf2. In digits, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to ct) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls str.width(0).

Remarks: The currency symbol is generated if and only if (str.flags() & str.showbase) is nonzero. If the number of characters generated for the specified format is less than the value returned by
str.width() on entry to the function, then copies of fill are inserted as necessary to pad to the specified
width. For the value af equal to (str.flags() & str.adjustfield), if (af == str.internal) is true, the fill characters are placed where none or space appears in the formatting pattern; otherwise if (af == str.left) is true, they are placed after the other characters; otherwise, they are placed
before the other characters. [Note: It is possible, with some combinations of format patterns and flag
values, to produce output that cannot be parsed using num_get<>::get. — end note]

Returns: An iterator pointing immediately after the last character produced.

28.4.6.3 Class template moneypunct

namespace std {
class money_base {
public:
enum part { none, space, symbol, sign, value };
struct pattern { char field[4]; };
};

template<class CharT, bool International = false>
class moneypunct : public locale::facet, public money_base {
public:
using char_type = CharT;
using string_type = basic_string<CharT>;
explicit moneypunct(size_t refs = 0);

CharT decimal_point() const;
CharT thousands_sep() const;
string grouping() const;
string_type curr_symbol() const;
string_type positive_sign() const;

§ 28.4.6.3 ©ISO/IEC 2020 – All rights reserved

The `moneypunct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value \( p \), such that the `part` value `static_cast<part>(p.field[i])` determines the \( i^{th} \) component of the format. In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.

Where `none` or `space` appears, white space is permitted in the format, except where `none` appears at the end, in which case no white space is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.

The format of the numeric monetary value is a decimal number:

\[
\text{value}: \quad \text{units fractional}_\text{opt} \quad \text{decimal-point digits} \\
\text{fractional}: \quad \text{decimal-point digits}_\text{opt}
\]

if `frac_digits()` returns a positive value, or

\[
\text{value}: \quad \text{units}
\]

otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

\[
\text{units}: \quad \text{digits} \\
\text{digits thousands-sep units} \\
\text{digits}: \quad \text{adigit digits}_\text{opt}
\]

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for \( c \) in the range ‘0’ through ‘9’ (inclusive) and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. White space characters are those characters \( c \) for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

276) An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.
The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `numpunct<>::do_grouping()`.

### 28.4.6.3.1 Members

```cpp
charT decimal_point() const;  // Returns: The radix separator to use in case `do_frac_digits()` is greater than zero.
charT thousands_sep() const;  // Returns: The digit group separator to use in case `do_grouping()` specifies a digit grouping pattern.
string grouping() const;     // Returns: A pattern defined identically as, but not necessarily equal to, the result of `numpunct<charT>::do_grouping()`.
string_type curr_symbol() const;  // Returns: A string to use as the currency identifier symbol. [Note: For specializations where the second template parameter is `true`, this is typically four characters long: a three-letter code as specified by ISO 4217 followed by a space. —end note]
string_type positive_sign() const;  // Returns: `do_positive_sign()` returns the string to use to indicate a positive monetary value.
string_type negative_sign() const;  // Returns: `do_negative_sign()` returns the string to use to indicate a negative value.
int frac_digits() const;   // Returns: The number of digits after the decimal radix separator, if any.
pattern pos_format() const;  // Returns: The specializations required in Table 103 (28.3.1.1.1), namely
pattern neg_format() const;
```

1. Each of these functions \( F \) returns the result of calling the corresponding virtual member function `do_F()`.

### 28.4.6.3.2 Virtual functions

```cpp
charT do_decimal_point() const;
charT do_thousands_sep() const;  // Returns: The digit group separator to use in case `do_grouping()` specifies a digit grouping pattern.
string do_grouping() const;     // Returns: A pattern defined identically as, but not necessarily equal to, the result of `numpunct<charT>::do_grouping()`.
string_type do_curr_symbol() const;  // Returns: A string to use as the currency identifier symbol. [Note: For specializations where the second template parameter is `true`, this is typically four characters long: a three-letter code as specified by ISO 4217 followed by a space. —end note]
string_type do_positive_sign() const;
string_type do_negative_sign() const;
int do_frac_digits() const;   // Returns: The number of digits after the decimal radix separator, if any.
pattern do_pos_format() const;
pattern do_neg_format() const;
```

1. In common U.S. locales this is ‘,’.
2. In common U.S. locales this is ‘,’.
3. To specify grouping by 3s, the value is “\003” not “3”.
4. This is usually the empty string.
5. In common U.S. locales, this is 2.
6. Note that the international symbol returned by `do_curr_symbol()` usually contains a space, itself; for example, “USD ”.

---

277) In common U.S. locales this is ‘,’.
278) In common U.S. locales this is ‘,’.
279) To specify grouping by 3s, the value is “\003” not “3”.
280) This is usually the empty string.
281) In common U.S. locales, this is 2.
282) Note that the international symbol returned by `do_curr_symbol()` usually contains a space, itself; for example, “USD ”.
28.4.6.4 Class template moneypunct_byname

namespace std {
    template<class charT, bool Intl = false>
    class moneypunct_byname : public moneypunct<charT, Intl> {
    public:
        using pattern = money_base::pattern;
        using string_type = basic_string<charT>;
        explicit moneypunct_byname(const char*, size_t refs = 0);
        explicit moneypunct_byname(const string&, size_t refs = 0);
    protected:
        ~moneypunct_byname();
    };
}

28.4.7 The message retrieval category

1 Class messages<charT> implements retrieval of strings from message catalogs.

28.4.7.1 Class template messages

namespace std {
    class messages_base {
    public:
        using catalog = unspecified signed integer type;
    }

    template<class charT>
    class messages : public locale::facet, public messages_base {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;
        explicit messages(size_t refs = 0);
        catalog open(const string& fn, const locale&) const;
        string_type get(catalog c, int set, intmsgid, const string_type& dfault) const;
        void close(catalog c) const;
        static locale::id id;
    protected:
        ~messages();
        virtual catalog do_open(const string&, const locale&) const;
        virtual string_type do_get(catalog, int set, intmsgid, const string_type& dfault) const;
        virtual void do_close(catalog) const;
    };
}

1 Values of type messages_base::catalog usable as arguments to members get and close can be obtained only by calling member open.

28.4.7.1.1 Members

catalog open(const string& name, const locale& loc) const;
1  Returns: do_open(name, loc).

string_type get(catalog cat, int set, intmsgid, const string_type& dfault) const;
2  Returns: do_get(cat, set,msgid, default).

void close(catalog cat) const;
3  Effects: Calls do_close(cat).

§ 28.4.7.1.1  ©ISO/IEC 2020 – All rights reserved
28.4.7.1.2 Virtual functions

catalog do_open(const string& name, const locale& loc) const;
1 Returns: A value that may be passed to get() to retrieve a message from the message catalog identified by the string name according to an implementation-defined mapping. The result can be used until it is passed to close().
2 Returns a value less than 0 if no such catalog can be opened.
3 Remarks: The locale argument loc is used for character set code conversion when retrieving messages, if needed.

string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;
4 Preconditions: cat is a catalog obtained from open() and not yet closed.
5 Returns: A message identified by arguments set, msgid, and default, according to an implementation-defined mapping. If no such message can be found, returns default.

void do_close(catalog cat) const;
6 Preconditions: cat is a catalog obtained from open() and not yet closed.
7 Effects: Releases unspecified resources associated with cat.
8 Remarks: The limit on such resources, if any, is implementation-defined.

28.4.7.2 Class template messages_byname

namespace std {
    template<class charT>
    class messages_byname : public messages<charT> {
    public:
        using catalog = messages_base::catalog;
        using string_type = basic_string<charT>;

        explicit messages_byname(const char*, size_t refs = 0);
        explicit messages_byname(const string&, size_t refs = 0);

        protected:
            ~messages_byname();
    };
}

28.5 C library locales

28.5.1 Header <clocale> synopsis

namespace std {
    struct lconv;

    char* setlocale(int category, const char* locale);
    lconv* localeconv();
}

#define NULL see 17.2.3
#define LC_ALL see below
#define LC_COLLATE see below
#define LC_CTYPE see below
#define LC_MONETARY see below
#define LC_NUMERIC see below
#define LC_TIME see below

1 The contents and meaning of the header <clocale> are the same as the C standard library header <locale.h>.
2 Calls to the function setlocale may introduce a data race (16.5.5.10) with other calls to setlocale or with calls to the functions listed in Table 114.

29 Input/output library

29.1 General

This Clause describes components that C++ programs may use to perform input/output operations.

The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in Table 115.

Table 115: Input/output library summary

3 [Note: Figure 7 illustrates relationships among various types described in this clause. A line from A to B indicates that A is an alias (e.g., a typedef) for B or that A is defined in terms of B.]

Figure 7: Stream position, offset, and size types

— end note —

29.2 Iostreams requirements

29.2.1 Imbue limitations

No function described in Clause 29 except for ios_base::imbue and basic_filebuf::pubimbue causes any instance of basic_ios::imbue or basic_streambuf::imbue to be called. If any user function called from a function declared in Clause 29 or as an overriding virtual function of any class declared in Clause 29 calls imbue, the behavior is undefined.
29.2.2 Positioning type limitations [iostreams.limits.pos]

1 The classes of Clause 29 with template arguments \texttt{charT} and \texttt{traits} behave as described if \texttt{traits::pos_-type} and \texttt{traits::off_type} are \texttt{streampos} and \texttt{streamoff} respectively. Except as noted explicitly below, their behavior when \texttt{traits::pos_type} and \texttt{traits::off_type} are other types is implementation-defined.

2 In the classes of Clause 29, a template parameter with name \texttt{charT} represents a member of the set of types containing \texttt{char}, \texttt{wchar_t}, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated.

29.2.3 Thread safety [iostreams.threadsafety]

1 Concurrent access to a stream object (29.8, 29.9), stream buffer object (29.6), or C Library stream (29.12) by multiple threads may result in a data race (6.9.2) unless otherwise specified (29.4). [\textit{Note: Data races result in undefined behavior (6.9.2).} — end note]

2 If one thread makes a library call \texttt{a} that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call \texttt{b} such that this does not result in a data race, then \texttt{a}’s write synchronizes with \texttt{b}’s read.

29.3 Forward declarations [iostream.forward]

29.3.1 Header \texttt{<iosfwd>} synopsis [iosfwd.syn]

```cpp
namespace std {
    template<class charT> struct char_traits;
    template<> struct char_traits<char>;
    template<> struct char_traits<char8_t>;
    template<> struct char_traits<char16_t>;

1 Default template arguments are described as appearing both in <iosfwd> and in the synopsis of other headers but it is well-formed to include both <iosfwd> and one or more of the other headers.284

284) It is the implementation’s responsibility to implement headers so that including <iosfwd> and other headers does not violate the rules about multiple occurrences of default arguments.
29.3.2 Overview

The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.

The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, and `basic_syncbuf`.

The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_istringstream` and `basic_ifstream`.

The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostringstream`, `basic_ofstream`, and `basic_osyncstream`.

The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`.

[Note: For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as charT (21.2). —end note]

Other typedef-names define instances of class templates specialized for char or wchar_t types.

Specializations of the class template fpos are used for specifying file position information. [Example: The types streampos and wstreampos are used for positioning streams specialized on char and wchar_t respectively. —end example]

[Note: This synopsis suggests a circularity between streampos and char_traits<char>. An implementation can avoid this circularity by substituting equivalent types. —end note]

29.4 Standard iostream objects

29.4.1 Header <iostream> synopsis

```cpp
#include <ios>    // see 29.5.1
#include <streambuf> // see 29.6.1
#include <istream>  // see 29.7.1
#include <ostream>  // see 29.7.2

namespace std {
    extern istream cin;
    extern ostream cout;
    extern ostream cerr;
    extern ostream clog;

    extern wistream wcin;
    extern wostream wcout;
    extern wostream wcerr;
    extern wostream wclog;
}
```

29.4.2 Overview

In this Clause, the type name FILE refers to the type FILE declared in <cstdio> (29.12.1).

The header <iostream> declares objects that associate objects with the standard C streams provided for by the functions declared in <cstdio>, and includes all the headers necessary to use these objects.

The objects are constructed and the associations are established at some time prior to or during the first time an object of class ios_base::Init is constructed, and in any case before the body of main (6.9.3.1) begins execution.284 The objects are not destroyed during program execution.285 The results of including <iostream> in a translation unit shall be as if <iostream> defined an instance of ios_base::Init with static storage duration.

Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing operations on FILEs, as specified in the C standard library.

284) If it is possible for them to do so, implementations should initialize the objects earlier than required.
285) Constructors and destructors for objects with static storage duration can access these objects to read input from stdin or write output to stdout or stderr.

§ 29.4.2 ©ISO/IEC 2020 – All rights reserved 1358
Concurrent access to a synchronized (29.5.3.4) standard iostream object’s formatted and unformatted input (29.7.4.1) and output (29.7.5.1) functions or a standard C stream by multiple threads does not result in a data race (6.9.2). [Note: Users must still synchronize concurrent use of these objects and streams by multiple threads if they wish to avoid interleaved characters. — end note]

See also: ISO C 7.21.2

29.4.3 Narrow stream objects

```cpp
#include <iostream>

using namespace std;

// narrow.stream.objects

istream cin;
1 The object cin controls input from a stream buffer associated with the object stdin, declared in <cstdio> (29.12.1).
2 After the object cin is initialized, cin.tie() returns &cout. Its state is otherwise the same as required for basic_ios<char>::init (29.5.5.2).

ostream cout;
3 The object cout controls output to a stream buffer associated with the object stdout, declared in <cstdio> (29.12.1).

ostream cerr;
4 The object cerr controls output to a stream buffer associated with the object stderr, declared in <cstdio> (29.12.1).
5 After the object cerr is initialized, cerr.flags() & unitbuf is nonzero and cerr.tie() returns &cout. Its state is otherwise the same as required for basic_ios<char>::init (29.5.5.2).

ostream clog;
6 The object clog controls output to a stream buffer associated with the object stderr, declared in <cstdio> (29.12.1).

29.4.4 Wide stream objects

```cpp
#include <wiostream>

using namespace std;

// wide.stream.objects

wistream wcin;
1 The object wcin controls input from a stream buffer associated with the object stdin, declared in <cstdio> (29.12.1).
2 After the object wcin is initialized, wcin.tie() returns &wcout. Its state is otherwise the same as required for basic_ios<wchar_t>::init (29.5.5.2).

wostream wcout;
3 The object wcout controls output to a stream buffer associated with the object stdout, declared in <cstdio> (29.12.1).

wostream wcerr;
4 The object wcerr controls output to a stream buffer associated with the object stderr, declared in <cstdio> (29.12.1).
5 After the object wcerr is initialized, wcerr.flags() & unitbuf is nonzero and wcerr.tie() returns &wcout. Its state is otherwise the same as required for basic_ios<wchar_t>::init (29.5.5.2).

wostream wclog;
6 The object wclog controls output to a stream buffer associated with the object stderr, declared in <cstdio> (29.12.1).

29.5 Iostreams base classes

29.5.1 Header <ios> synopsis

```cpp
#include <iosfwd> // see 29.3.1

namespace std {
    using streamoff = implementation-defined;
    using streamsize = implementation-defined;
}
```

```
template<class stateT> class fpos;

class ios_base;

// 29.5.6, manipulators
ios_base& boolalpha (ios_base& str);
ios_base& noboolalpha(ios_base& str);

ios_base& showbase (ios_base& str);
ios_base& noshowbase (ios_base& str);

ios_base& showpoint (ios_base& str);
ios_base& noshowpoint(ios_base& str);

ios_base& showpos (ios_base& str);
ios_base& noshowpos (ios_base& str);

ios_base& skipws (ios_base& str);
ios_base& noskipws (ios_base& str);

ios_base& uppercase (ios_base& str);
ios_base& nouppercase(ios_base& str);

ios_base& unitbuf (ios_base& str);
ios_base& nounitbuf (ios_base& str);

// 29.5.6.2, adjustfield
ios_base& internal (ios_base& str);
ios_base& left (ios_base& str);
ios_base& right (ios_base& str);

// 29.5.6.3, basefield
ios_base& dec (ios_base& str);
ios_base& hex (ios_base& str);
ios_base& oct (ios_base& str);

// 29.5.6.4, floatfield
ios_base& fixed (ios_base& str);
ios_base& scientific (ios_base& str);
ios_base& hexfloat (ios_base& str);
ios_base& defaultfloat(ios_base& str);

// 29.5.7, error reporting
enum class io_errc {
  stream = 1
};

template<> struct is_error_code_enum<io_errc> : public true_type { };  
exterior_error_code make_error_code(io_errc e) noexcept;
exception_error_condition make_error_condition(io_errc e) noexcept;
const error_category& iostream_category() noexcept;
}

29.5.2 Types

using streamoff = implementation-defined;

1 The type streamoff is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.286

286) Typically long long.
using streamsize = implementation-defined;

The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.  

### 29.5.3 Class `ios_base`

```cpp
namespace std {
    class ios_base {
    public:
        class failure; // see below

        // 29.5.3.1.2, fmtflags
        using fmtflags = T1;
        static constexpr fmtflags boolalpha = unspecified;
        static constexpr fmtflags dec = unspecified;
        static constexpr fmtflags fixed = unspecified;
        static constexpr fmtflags hex = unspecified;
        static constexpr fmtflags internal = unspecified;
        static constexpr fmtflags left = unspecified;
        static constexpr fmtflags oct = unspecified;
        static constexpr fmtflags right = unspecified;
        static constexpr fmtflags scientific = unspecified;
        static constexpr fmtflags showbase = unspecified;
        static constexpr fmtflags showpoint = unspecified;
        static constexpr fmtflags showpos = unspecified;
        static constexpr fmtflags skipws = unspecified;
        static constexpr fmtflags unitbuf = unspecified;
        static constexpr fmtflags uppercase = unspecified;
        static constexpr fmtflags adjustfield = see below;
        static constexpr fmtflags basefield = see below;
        static constexpr fmtflags floatfield = see below;

        // 29.5.3.1.3, iostate
        using iostate = T2;
        static constexpr iostate badbit = unspecified;
        static constexpr iostate eofbit = unspecified;
        static constexpr iostate failbit = unspecified;
        static constexpr iostate goodbit = see below;

        // 29.5.3.1.4, openmode
        using openmode = T3;
        static constexpr openmode app = unspecified;
        static constexpr openmode ate = unspecified;
        static constexpr openmode binary = unspecified;
        static constexpr openmode in = unspecified;
        static constexpr openmode out = unspecified;
        static constexpr openmode trunc = unspecified;

        // 29.5.3.1.5, seekdir
        using seekdir = T4;
        static constexpr seekdir beg = unspecified;
        static constexpr seekdir cur = unspecified;
        static constexpr seekdir end = unspecified;

        class Init;

        // 29.5.3.2, fmtflags state
        fmtflags flags() const;
        fmtflags flags(fmtflags fmtfl);
        fmtflags setf(fmtflags fmtfl);
        fmtflags setf(fmtflags fmtfl, fmtflags mask);
        void unsetf(fmtflags mask);
    }
}
```

---

287) `streamsize` is used in most places where ISO C would use `size_t`. 

§ 29.5.3 ©ISO/IEC 2020 – All rights reserved 1361
streamsize precision() const;
streamsize precision(streamsize prec);
streamsize width() const;
streamsize width(streamsize wide);

// 29.5.3.3, locales
locale imbue(const locale& loc);
locale getloc() const;

// 29.5.3.5, storage
static int xalloc();
long& iword(int idx);
void*& pword(int idx);

// destructor
virtual ~ios_base();

// 29.5.3.6, callbacks
enum event { erase_event, imbue_event, copyfmt_event };
using event_callback = void (*)(event, ios_base&, int idx);
void register_callback(event_callback fn, int idx);

ios_base(const ios_base&) = delete;
ios_base& operator=(const ios_base&) = delete;

static bool sync_with_stdio(bool sync = true);

protected:
    ios_base();

private:
    static int index;              // exposition only
    long* iarray;                  // exposition only
    void** parray;                 // exposition only
};

1 ios_base defines several member types:
   (1.1) — a type failure, defined as either a class derived from system_error or a synonym for a class derived from system_error;
   (1.2) — a class Init;
   (1.3) — three bitmask types, fmtflags, iostate, and openmode;
   (1.4) — an enumerated type, seekdir.

2 It maintains several kinds of data:
   (2.1) — state information that reflects the integrity of the stream buffer;
   (2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;
   (2.3) — additional information that is stored by the program for its private use.

3 [Note: For the sake of exposition, the maintained data is presented here as:
   (3.1) — static int index, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;
   (3.2) — long* iarray, points to the first element of an arbitrary-length long array maintained for the private use of the program;
   (3.3) — void** parray, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.
   — end note]
29.5.3.1 Types
[ios.types]

29.5.3.1.1 Class ios_base::failure
[ios.failure]

namespace std {

    class ios_base::failure : public system_error {
    public:
        explicit failure(const string& msg, const error_code& ec = io_errc::stream);
        explicit failure(const char* msg, const error_code& ec = io_errc::stream);
    }
}

An implementation is permitted to define ios_base::failure as a synonym for a class with equivalent functionality to class ios_base::failure shown in this subclause. [Note: When ios_base::failure is a synonym for another type, that type is required to provide a nested type failure to emulate the injected-class-name. — end note] The class failure defines the base class for the types of all objects thrown as exceptions, by functions in the iostreams library, to report errors detected during stream buffer operations.

When throwing ios_base::failure exceptions, implementations should provide values of ec that identify the specific reason for the failure. [Note: Errors arising from the operating system would typically be reported as system_category() errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as error_code(io_errc::stream, iostream_category()). — end note]

    explicit failure(const string& msg, const error_code& ec = io_errc::stream);

Effects: Constructs the base class with msg and ec.

    explicit failure(const char* msg, const error_code& ec = io_errc::stream);

Effects: Constructs the base class with msg and ec.

29.5.3.1.2 Type ios_base::fmtflags
[ios.fmtflags]

using fmtflags = T1;

The type fmtflags is a bitmask type (16.4.2.2.4). Setting its elements has the effects indicated in Table 116.

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolalpha</td>
<td>insert and extract bool type in alphabetic format</td>
</tr>
<tr>
<td>dec</td>
<td>converts integer input or generates integer output in decimal base</td>
</tr>
<tr>
<td>fixed</td>
<td>generate floating-point output in fixed-point notation</td>
</tr>
<tr>
<td>hex</td>
<td>converts integer input or generates integer output in hexadecimal base</td>
</tr>
<tr>
<td>internal</td>
<td>adds fill characters at a designated internal point in certain generated output, or identical to right if no such point is designated</td>
</tr>
<tr>
<td>left</td>
<td>adds fill characters on the right (final positions) of certain generated output</td>
</tr>
<tr>
<td>oct</td>
<td>converts integer input or generates integer output in octal base</td>
</tr>
<tr>
<td>right</td>
<td>adds fill characters on the left (initial positions) of certain generated output</td>
</tr>
<tr>
<td>scientific</td>
<td>generates floating-point output in scientific notation</td>
</tr>

</tbody>
</table>

29.5.3.1.3 **Type** `ios_base::iostate`  [ios.iostate]

using iostate = T2;

1  The type `iostate` is a bitmask type (16.4.2.2.4) that contains the elements indicated in Table 118.

Table 118: **iostate effects**  [tab:ios.iostate]

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>badbit</td>
<td>indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);</td>
</tr>
<tr>
<td>eofbit</td>
<td>indicates that an input operation reached the end of an input sequence;</td>
</tr>
<tr>
<td>failbit</td>
<td>indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.</td>
</tr>
</tbody>
</table>

2  Type `iostate` also defines the constant:

(2.1) — **goodbit**, the value zero.

29.5.3.1.4 **Type** `ios_base::openmode`  [ios.openmode]

using openmode = T3;

1  The type `openmode` is a bitmask type (16.4.2.2.4). It contains the elements indicated in Table 119.

Table 119: **openmode effects**  [tab:ios.openmode]

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>seek to end before each write</td>
</tr>
<tr>
<td>ate</td>
<td>open and seek to end immediately after opening</td>
</tr>
<tr>
<td>binary</td>
<td>perform input and output in binary mode (as opposed to text mode)</td>
</tr>
<tr>
<td>in</td>
<td>open for input</td>
</tr>
<tr>
<td>out</td>
<td>open for output</td>
</tr>
<tr>
<td>trunc</td>
<td>truncate an existing stream when opening</td>
</tr>
</tbody>
</table>

29.5.3.1.5 **Type** `ios_base::seekdir`  [ios.seekdir]

using seekdir = T4;

1  The type `seekdir` is an enumerated type (16.4.2.3.3) that contains the elements indicated in Table 120.

Table 120: **seekdir effects**  [tab:ios.seekdir]

<table>
<thead>
<tr>
<th>Element</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>beg</td>
<td>request a seek (for subsequent input or output) relative to the beginning of the stream</td>
</tr>
<tr>
<td>cur</td>
<td>request a seek relative to the current position within the sequence</td>
</tr>
<tr>
<td>end</td>
<td>request a seek relative to the current end of the sequence</td>
</tr>
</tbody>
</table>
29.5.3.1.6 Class ios_base::Init

namespace std {
    class ios_base::Init {
    public:
        Init();
        Init(const Init&) = default;
        ~Init();
        Init& operator=(const Init&) = default;
    private:
        static int init_cnt;  // exposition only
    };
}

1 The class Init describes an object whose construction ensures the construction of the eight objects declared in <iostream> (29.4) that associate file stream buffers with the standard C streams provided for by the functions declared in <cstdio> (29.12.1).

2 For the sake of exposition, the maintained data is presented here as:

— static int init_cnt, counts the number of constructor and destructor calls for class Init, initialized to zero.

   Init();

3 Effects: Constructs and initializes the objects cin, cout, cerr, clog, wcin, wcout, wcerr, and wclog if they have not already been constructed and initialized.

   ~Init();

4 Effects: If there are no other instances of the class still in existence, calls cout.flush(), cerr.flush(), clog.flush(), wcout.flush(), wcerr.flush(), wclog.flush().

29.5.3.2 State functions

fmtflags flags() const;

1 Returns: The format control information for both input and output.

fmtflags flags(fmtflags fmtfl);

2 Postconditions: fmtfl == flags().

3 Returns: The previous value of flags().

fmtflags setf(fmtflags fmtfl);

4 Effects: Sets fmtfl in flags().

5 Returns: The previous value of flags().

fmtflags setf(fmtflags fmtfl, fmtflags mask);

6 Effects: Clears mask in flags(), sets fmtfl & mask in flags().

7 Returns: The previous value of flags().

void unsetf(fmtflags mask);

8 Effects: Clears mask in flags().

streamsize precision() const;

9 Returns: The precision to generate on certain output conversions.

streamsize precision(streamsize prec);

10 Postconditions: prec == precision().

11 Returns: The previous value of precision().

streamsize width() const;

12 Returns: The minimum field width (number of characters) to generate on certain output conversions.
streamsize width(streamsize wide);

13 \hspace{1em} \textit{Postconditions:} \hspace{0.5em} \texttt{wide} == \texttt{width()).}

14 \hspace{1em} \textit{Returns:} The previous value of \texttt{width().}

29.5.3.3 Functions \hspace{1em} \texttt{[ios.base.locales]}

locale imbue(const locale& loc);

1 \hspace{1em} \textit{Effects:} Calls each registered callback pair (\texttt{fn, idx}) (29.5.3.6) as (*\texttt{fn})(\texttt{imbue_event}, *\texttt{this}, idx) at such a time that a call to \texttt{ios_base::getloc()} from within \texttt{fn} returns the new locale value \texttt{loc}.

2 \hspace{1em} \textit{Postconditions:} \texttt{loc} == \texttt{getloc().}

3 \hspace{1em} \textit{Returns:} The previous value of \texttt{getloc().}

locale getloc() const;

4 \hspace{1em} \textit{Returns:} If no locale has been imbued, a copy of the global C++ locale, \texttt{locale()}, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

29.5.3.4 Static members \hspace{1em} \texttt{[ios.members.static]}

static bool sync_with_stdio(bool sync = true);

1 \hspace{1em} \textit{Returns:} true if the previous state of the standard iostream objects (29.4) was synchronized and otherwise returns false. The first time it is called, the function returns true.

2 \hspace{1em} \textit{Effects:} If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a false argument, it allows the standard streams to operate independently of the standard C streams.

3 \hspace{1em} When a standard iostream object \texttt{str} is \textit{synchronized} with a standard stdio stream \texttt{f}, the effect of inserting a character \texttt{c} by

\begin{verbatim}
    fputc(f, c);
\end{verbatim}

is the same as the effect of

\begin{verbatim}
    str.rdbuf()->sputc(c);
\end{verbatim}

for any sequences of characters; the effect of extracting a character \texttt{c} by

\begin{verbatim}
    c = fgetc(f);
\end{verbatim}

is the same as the effect of

\begin{verbatim}
    c = str.rdbuf()->sbumpc();
\end{verbatim}

for any sequences of characters; and the effect of pushing back a character \texttt{c} by

\begin{verbatim}
    ungetc(c, f);
\end{verbatim}

is the same as the effect of

\begin{verbatim}
    str.rdbuf()->sputbackc(c);
\end{verbatim}

for any sequence of characters.\footnote{This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.}

29.5.3.5 Storage functions \hspace{1em} \texttt{[ios.base.storage]}

static int xalloc();

1 \hspace{1em} \textit{Returns:} \texttt{index ++.}

2 \hspace{1em} \textit{Remarks:} Concurrent access to this function by multiple threads does not result in a data race (6.9.2).

long& iword(int idx);

3 \hspace{1em} \textit{Preconditions:} \texttt{idx} is a value obtained by a call to \texttt{xalloc}.

4 \hspace{1em} \textit{Effects:} If \texttt{iarray} is a null pointer, allocates an array of \texttt{long} of unspecified size and stores a pointer to its first element in \texttt{iarray}. The function then extends the array pointed at by \texttt{iarray} as necessary
to include the element \texttt{iarray[idx]}. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operations on the object.\(^{289}\) However, the value of the storage referred to is retained, so that until the next call to \texttt{copyfmt}, calling \texttt{ivord} with the same index yields another reference to the same value. If the function fails\(^{289}\) and \*\texttt{this} is a base class subobject of a \texttt{basic_ios<>} object or subobject, the effect is equivalent to calling \texttt{basic_ios<>::setstate(badbit)} on the derived object (which may throw \texttt{failure}).

\textit{Returns:} On success \texttt{iarray[idx]}. On failure, a valid \texttt{long\&} initialized to 0.

\begin{verbatim}
void* & pword(int idx);
\end{verbatim}

\textit{Preconditions:} \(\texttt{idx}\) is a value obtained by a call to \texttt{xalloc}.

\textit{Effects:} If \texttt{parray} is a null pointer, allocates an array of pointers to \texttt{void} of unspecified size and stores a pointer to its first element in \texttt{parray}. The function then extends the array pointed at by \texttt{parray} as necessary to include the element \texttt{parray[idx]}. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operations on the object. However, the value of the storage referred to is retained, so that until the next call to \texttt{copyfmt}, calling \texttt{pword} with the same index yields another reference to the same value. If the function fails\(^{291}\) and \*\texttt{this} is a base class subobject of a \texttt{basic_ios<>} object or subobject, the effect is equivalent to calling \texttt{basic_ios<>::setstate(badbit)} on the derived object (which may throw \texttt{failure}).

\textit{Returns:} On success \texttt{parray[idx]}. On failure a valid \texttt{void*\&} initialized to 0.

\textit{Remarks:} After a subsequent call to \texttt{pword(int)} for the same object, the earlier return value may no longer be valid.

### 29.5.3.6 Callbacks

\begin{verbatim}
void register_callback(event_callback fn, int idx);
\end{verbatim}

\textit{Preconditions:} The function \texttt{fn} does not throw exceptions.

\textit{Effects:} Registers the pair \((\texttt{fn}, \texttt{idx})\) such that during calls to \texttt{imbue()} (29.5.3.3), \texttt{copyfmt()}, or \texttt{~ios_base()} (29.5.3.7), the function \texttt{fn} is called with argument \texttt{idx}. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

\textit{Remarks:} Identical pairs are not merged. A function registered twice will be called twice.

### 29.5.3.7 Constructors and destructor

\begin{verbatim}
ios_base();
\end{verbatim}

\textit{Effects:} Each \texttt{ios_base} member has an indeterminate value after construction. The object’s members shall be initialized by calling \texttt{basic_ios::init} before the object’s first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

\begin{verbatim}
~ios_base();
\end{verbatim}

\textit{Effects:} Calls each registered callback pair \((\texttt{fn}, \texttt{idx})\) (29.5.3.6) as \((\ast\texttt{fn})(\texttt{erase_event}, \ast\texttt{this}, \texttt{idx})\) at such time that any \texttt{ios_base} member function called from within \texttt{fn} has well-defined results.

### 29.5.4 Class template \texttt{fpos}

\begin{verbatim}
namespace std {
    template<class stateT> class fpos {
        public:
            // 29.5.4.1, members
            stateT state() const;
            void state(stateT);
        private:
            stateT st; // exposition only
    };
}
\end{verbatim}

\begin{enumerate}
\item \(^{289}\) An implementation is free to implement both the integer array pointed at by \texttt{iarray} and the pointer array pointed at by \texttt{parray} as sparse data structures, possibly with a one-element cache for each.
\item \(^{290}\) For example, because it cannot allocate space.
\item \(^{291}\) For example, because it cannot allocate space.
\end{enumerate}
29.5.4.1 Members

```c
void state(stateT s);
```

*Effects:* Assigns `s` to `st`.

```c
stateT state() const;
```

*Returns:* Current value of `st`.

29.5.4.2 Requirements

1. An `fpos` type specifies file position information. It holds a state object whose type is equal to the template parameter `stateT`. Type `stateT` shall meet the `Cpp17DefaultConstructible` (Table 27), `Cpp17CopyConstructible` (Table 29), `Cpp17CopyAssignable` (Table 31), and `Cpp17Destructible` (Table 32) requirements. If `is_trivially_copy_constructible_v<stateT>` is `true`, then `fpos<stateT>` has a trivial copy constructor. If `is_trivially_copyAssignable_v<stateT>` is `true`, then `fpos<stateT>` has a trivial copy assignment operator. If `is_trivially_destructible_v<stateT>` is `true`, then `fpos<stateT>` has a trivial destructor. All specializations of `fpos` meet the `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, `Cpp17CopyAssignable`, `Cpp17Destructible`, and `Cpp17EqualityComparable` (Table 25) requirements. In addition, the expressions shown in Table 121 are valid and have the indicated semantics. In that table,

-(1.1) — `P` refers to an instance of `fpos`,
-(1.2) — `p` and `q` refer to values of type `P` or `const P`,
-(1.3) — `pl` and `ql` refer to modifiable lvalues of type `P`,
-(1.4) — `0` refers to type `streamoff`, and
-(1.5) — `o` refers to a value of type `streamoff` or `const streamoff`.

</tbody>
</table>

2 Stream operations that return a value of type `traits::pos_type` return `P(0(-1))` as an invalid value to signal an error. If this value is used as an argument to any `istream`, `ostream`, or `streambuf` member that accepts a value of type `traits::pos_type` then the behavior of that function is undefined.

29.5.5 Class template basic_ios

29.5.5.1 Overview

```c
namespace std {
template<class charT, class traits = char_traits<charT>>
```
class basic_ios : public ios_base {
public:
    using char_type = charT;
    using int_type = typename traits::int_type;
    using pos_type = typename traits::pos_type;
    using off_type = typename traits::off_type;
    using traits_type = traits;

    // 29.5.5.4, flags functions
    explicit operator bool() const;
    bool operator!() const;
    iostate rdstate() const;
    void clear(iostate state = goodbit);
    void setstate(iostate state);
    bool good() const;
    bool eof() const;
    bool fail() const;
    bool bad() const;

    iostate exceptions() const;
    void exceptions(iostate except);

    // 29.5.5.2, constructor/destructor
    explicit basic_ios(basic_streambuf<charT, traits>* sb);
    virtual ~basic_ios();

    // 29.5.5.3, members
    basic_ostream<charT, traits>* tie() const;
    basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
    basic_streambuf<charT, traits>* rdbuf() const;
    basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);
    basic_ios& copyfmt(const basic_ios& rhs);
    char_type fill() const;
    char_type fill(char_type ch);
    locale imbue(const locale& loc);
    char narrow(char_type c, char dfault) const;
    char_type widen(char c) const;

    basic_ios(const basic_ios&) = delete;
    basic_ios& operator=(const basic_ios&) = delete;

protected:
    basic_ios();
    void init(basic_streambuf<charT, traits>* sb);
    void move(basic_ios& rhs);
    void move(basic_ios&& rhs);
    void swap(basic_ios& rhs) noexcept;
    void set_rdbuf(basic_streambuf<charT, traits>* sb);
};

29.5.5.2 Constructors

explicit basic_ios(basic_streambuf<charT, traits>* sb);

1 Effects: Assigns initial values to its member objects by calling init(sb).
basic_ios();

Effects: Leaves its member objects uninitialized. The object shall be initialized by calling basic_ios::init before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

~basic_ios();

Remarks: The destructor does not destroy rdbuf().

void init(basic_streambuf<charT, traits>* sb);

Postconditions: The postconditions of this function are indicated in Table 122.

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

29.5.5.3 Member functions

basic_ostream<charT, traits>* tie() const;

Returns: An output sequence that is tied to (synchronized with) the sequence controlled by the stream buffer.

basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tиestr);

Preconditions: If tиestr is not null, tиestr is not reachable by traversing the linked list of tied stream objects starting from tиestr->tie().

Postconditions: tиestr == tie().

Returns: The previous value of tie().

basic_streambuf<charT, traits>* rdbuf() const;

Returns: A pointer to the streambuf associated with the stream.

basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

Effects: Calls clear().

Postconditions: sb == rdbuf().

Returns: The previous value of rdbuf().

locale imbue(const locale& loc);

Effects: Calls ios_base::imbue(loc) (29.5.3.3) and if rdbuf() ! = 0 then rdbuf()->pubimbue(loc) (29.6.3.2.1).

Returns: The prior value of ios_base::imbue().

char narrow(char_type c, char dfault) const;

Returns: use_facet<ctype<char_type>>().narrow(c, dfault)
char_type widen(char c) const;

Returns: use_facet<ctype<char_type>>(getloc()).widen(c)

char_type fill() const;

Returns: The character used to pad (fill) an output conversion to the specified field width.

char_type fill(char_type fillch);

Postconditions: traits::eq(fillch, fill()).

Returns: The previous value of fill().

basic_ios& copyfmt(const basic_ios& rhs);

Effects: If (this == addressof(rhs)) is true does nothing. Otherwise assigns to the member objects of *this the corresponding member objects of rhs as follows:

(16.1) — calls each registered callback pair [(fn) erase_event, *this, idx);

(16.2) — then, assigns to the member objects of *this the corresponding member objects of rhs, except that

(16.2.1) — rdstate(), rdbuf(), and exceptions() are left unchanged;

(16.2.2) — the contents of arrays pointed at by pword and iword are copied, not the pointers themselves,\(^{292}\) and

(16.2.3) — if any newly stored pointer values in *this point at objects stored outside the object rhs and those objects are destroyed when rhs is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;

(16.3) — then, calls each callback pair that was copied from rhs as (*fn)[copyfmt_event, *this, idx];

(16.4) — then, calls exceptions(rhs.exceptions()).

[Note: The second pass through the callback pairs permits a copied pword value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken. — end note]

Postconditions: The postconditions of this function are indicated in Table 123.

Table 123: basic_ios::copyfmt() effects [tab:basic.ios.copyfmt]

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>rdbuf()</td>
<td>unchanged</td>
</tr>
<tr>
<td>tie()</td>
<td>rhs.tie()</td>
</tr>
<tr>
<td>rdstate()</td>
<td>unchanged</td>
</tr>
<tr>
<td>exceptions()</td>
<td>rhs.exceptions()</td>
</tr>
<tr>
<td>flags()</td>
<td>rhs.flags()</td>
</tr>
<tr>
<td>width()</td>
<td>rhs.width()</td>
</tr>
<tr>
<td>precision()</td>
<td>rhs.precision()</td>
</tr>
<tr>
<td>fill()</td>
<td>rhs.fill()</td>
</tr>
<tr>
<td>getloc()</td>
<td>rhs.getloc()</td>
</tr>
</tbody>
</table>

Returns: *this.

void move(basic_ios& rhs);
void move(basic_ios&& rhs);

Postconditions: *this has the state that rhs had before the function call, except that rdbuf() returns nullptr. rhs is in a valid but unspecified state, except that rhs.rdbuf() returns the same value as it returned before the function call, and rhs.tie() returns nullptr.

\(^{292}\) This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.
void swap(basic_ios& rhs) noexcept;

**Effects:** The states of \*this and rhs are exchanged, except that rdbuf() returns the same value as it returned before the function call, and rhs.rdbuf() returns the same value as it returned before the function call.

void set_rdbuf(basic_streambuf<charT, traits>* sb);

**Preconditions:** sb != nullptr is true.

**Effects:** Associates the basic_streambuf object pointed to by sb with this stream without calling clear().

**Postconditions:** rdbuf() == sb is true.

**Throws:** Nothing.

### 29.5.5.4 Flags functions

explicit operator bool() const;

**Returns:** !fail().

bool operator!() const;

**Returns:** fail().

iostate rdstate() const;

**Returns:** The error state of the stream buffer.

void clear(iostate state = goodbit);

**Postconditions:** If rdbuf() != 0 then state == rdstate(); otherwise rdstate() == (state | ios_base::badbit).

**Effects:** If ((state | (rdbuf() ? goodbit : badbit) & exceptions()) == 0, returns. Otherwise, the function throws an object of class ios_base::failure (29.5.3.1.1), constructed with implementation-defined argument values.

void setstate(iostate state);

**Effects:** Calls clear(rdstate() | state) (which may throw ios_base::failure (29.5.3.1.1)).

bool good() const;

**Returns:** rdstate() == 0

bool eof() const;

**Returns:** true if eofbit is set in rdstate().

bool fail() const;

**Returns:** true if failbit or badbit is set in rdstate().

bool bad() const;

**Returns:** true if badbit is set in rdstate().

iostate exceptions() const;

**Returns:** A mask that determines what elements set in rdstate() cause exceptions to be thrown.

void exceptions(iostate except);

**Postconditions:** except == exceptions().

**Effects:** Calls clear(rdstate()).

### 29.5.6 ios_base manipulators

#### 29.5.6.1 fmtflags manipulators

Each function specified in this subclause is a designated addressable function (16.5.4.2.1).

---

293) Checking badbit also for fail() is historical practice.
ios_base& boolalpha(ios_base& str);
  Effects: Calls str.setf(ios_base::boolalpha).
  Returns: str.

ios_base& noboolalpha(ios_base& str);
  Effects: Calls str.unsetf(ios_base::boolalpha).
  Returns: str.

ios_base& showbase(ios_base& str);
  Effects: Calls str.setf(ios_base::showbase).
  Returns: str.

ios_base& noshowbase(ios_base& str);
  Effects: Calls str.unsetf(ios_base::showbase).
  Returns: str.

ios_base& showpoint(ios_base& str);
  Effects: Calls str.setf(ios_base::showpoint).
  Returns: str.

ios_base& noshowpoint(ios_base& str);
  Effects: Calls str.unsetf(ios_base::showpoint).
  Returns: str.

ios_base& showpos(ios_base& str);
  Effects: Calls str.setf(ios_base::showpos).
  Returns: str.

ios_base& noshowpos(ios_base& str);
  Effects: Calls str.unsetf(ios_base::showpos).
  Returns: str.

ios_base& skipws(ios_base& str);
  Effects: Calls str.setf(ios_base::skipws).
  Returns: str.

ios_base& noskipws(ios_base& str);
  Effects: Calls str.unsetf(ios_base::skipws).
  Returns: str.

ios_base& uppercase(ios_base& str);
  Effects: Calls str.setf(ios_base::uppercase).
  Returns: str.

ios_base& nouppercase(ios_base& str);
  Effects: Calls str.unsetf(ios_base::uppercase).
  Returns: str.

ios_base& unitbuf(ios_base& str);
  Effects: Calls str.setf(ios_base::unitbuf).
  Returns: str.

ios_base& nounitbuf(ios_base& str);
  Effects: Calls str.unsetf(ios_base::unitbuf).
  Returns: str.
Returns: str.

29.5.6.2 adjustfield manipulators

Each function specified in this subclause is a designated addressable function (16.5.4.2.1).

ios_base& internal(ios_base& str);
"Effects: Calls str.setf(ios_base::internal, ios_base::adjustfield).
Returns: str.

ios_base& left(ios_base& str);
"Effects: Calls str.setf(ios_base::left, ios_base::adjustfield).
Returns: str.

ios_base& right(ios_base& str);
"Effects: Calls str.setf(ios_base::right, ios_base::adjustfield).
Returns: str.

29.5.6.3 basefield manipulators

Each function specified in this subclause is a designated addressable function (16.5.4.2.1).

ios_base& dec(ios_base& str);
"Effects: Calls str.setf(ios_base::dec, ios_base::basefield).
Returns: str.

ios_base& hex(ios_base& str);
"Effects: Calls str.setf(ios_base::hex, ios_base::basefield).
Returns: str.

ios_base& oct(ios_base& str);
"Effects: Calls str.setf(ios_base::oct, ios_base::basefield).
Returns: str.

29.5.6.4 floatfield manipulators

Each function specified in this subclause is a designated addressable function (16.5.4.2.1).

ios_base& fixed(ios_base& str);
"Effects: Calls str.setf(ios_base::fixed, ios_base::floatfield).
Returns: str.

ios_base& scientific(ios_base& str);
"Effects: Calls str.setf(ios_base::scientific, ios_base::floatfield).
Returns: str.

ios_base& hexfloat(ios_base& str);
"Effects: Calls str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield).
Returns: str.

[Note: The more obvious use of ios_base::hex to specify hexadecimal floating-point format would change
the meaning of existing well-defined programs. C++ 2003 gives no meaning to the combination of fixed and
scientific. — end note]

ios_base& defaultfloat(ios_base& str);
"Effects: Calls str.unsetf(ios_base::floatfield).
Returns: str.

294) The function signature dec(ios_base& can be called by the function signature basic_ostream & stream::operator<<(ios_base & (*)(ios_base&)) to permit expressions of the form cout << dec to change the format flags stored in cout.
29.5.7 Error reporting

```cpp
error_code make_error_code(io_errc e) noexcept;
```

*Returns:* `error_code(static_cast<int>(e), iostream_category())`.

```cpp
error_condition make_error_condition(io_errc e) noexcept;
```

*Returns:* `error_condition(static_cast<int>(e), iostream_category())`.

```cpp
const error_category& iostream_category() noexcept;
```

*Returns:* A reference to an object of a type derived from class `error_category`.

The object’s `default_error_condition` and `equivalent` virtual functions shall behave as specified for the class `error_category`. The object’s `name` virtual function shall return a pointer to the string "iostream".

29.6 Stream buffers

29.6.1 Header `<streambuf>` synopsis

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf;

    using streambuf = basic_streambuf<char>;
    using wstreambuf = basic_streambuf<wchar_t>;
}
```

*The header `<streambuf>` defines types that control input from and output to character sequences.*

29.6.2 Stream buffer requirements

Stream buffers can impose various constraints on the sequences they control. Some constraints are:

1. The controlled input sequence can be not readable.
2. The controlled output sequence can be not writable.
3. The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.
4. The controlled sequences can support operations directly to or from associated sequences.
5. The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.

Each sequence is characterized by three pointers which, if non-null, all point into the same `charT` array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:

- the *beginning pointer*, or lowest element address in the array (called `xbeg` here);
- the *next pointer*, or next element address that is a current candidate for reading or writing (called `xnext` here);
- the *end pointer*, or first element address beyond the end of the array (called `xend` here).

The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:

1. If `xnext` is not a null pointer, then `xbeg` and `xend` shall also be non-null pointers into the same `charT` array, as described above; otherwise, `xbeg` and `xend` shall also be null.
2. If `xnext` is not a null pointer and `xnext < xend` for an output sequence, then a *write position* is available. In this case, `*xnext` shall be assignable as the next element to write (to put, or to store a character value, into the sequence).
3. If `xnext` is not a null pointer and `xbeg < xnext` for an input sequence, then a *putback position* is available. In this case, `xnext[-1]` shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.
— If \texttt{xnext} is not a null pointer and \texttt{xnext < xend} for an input sequence, then a read position is available. In this case, \texttt{*xnext} shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

\section*{29.6.3 Class template \texttt{basic\_streambuf}}

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;
        virtual ~basic_streambuf();

        // 29.6.3.2.1, locales
        locale pubimbue(const locale& loc);
        locale getloc() const;

        // 29.6.3.2.2, buffer and positioning
        basic_streambuf* pubsetbuf(char_type* s, streamsize n);
        pos_type pubseekoff(off_type off, ios_base::seekdir way,
            ios_base::openmode which = ios_base::in | ios_base::out);
        pos_type pubseekpos(pos_type sp,

```

\section*{§ 29.6.3}
1 The class template basic_streambuf serves as an abstract base class for deriving various stream buffers whose objects each control two character sequences:

(1.1) — a character input sequence;
(1.2) — a character output sequence.

29.6.3.1 Constructors [streambuf.cons]

basic_streambuf();

Effects: Initializes:

— all pointer member objects to null pointers,
— the getloc() member to a copy the global locale, locale(), at the time of construction.

Remarks: Once the getloc() member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member imbue is called.

basic_streambuf(const basic_streambuf& rhs);

Postconditions:

— eback() == rhs.eback()
— gptr() == rhs.gptr()
— egptr() == rhs.egptr()
— pbeg() == rhs.pbeg()
— pptr() == rhs.pptr()
— epptr() == rhs.epptr()

295) The default constructor is protected for class basic_streambuf to assure that only objects for classes derived from this class may be constructed.
(3.7) getloc() == rhs.getloc()

Effects: None.

29.6.3.2 Public member functions

29.6.3.2.1 Locales

locale pubimbue(const locale& loc);

Effects: Calls imbue(loc).
Postconditions: loc == getloc().

Returns: Previous value of getloc().

locale getloc() const;

Returns: If pubimbue() has ever been called, then the last value of loc supplied, otherwise the current global locale, locale(), in effect at the time of construction. If called after pubimbue() has been called but before pubimbue has returned (i.e., from within the call of imbue()) then it returns the previous value.

29.6.3.2.2 Buffer management and positioning

basic_streambuf* pubsetbuf(char_type* s, streamsize n);
Returns: setbuf(s, n).

pos_type pubseekoff(off_type off, ios_base::seekdir way,
ios_base::openmode which = ios_base::in | ios_base::out);
Returns: seekoff(off, way, which).

pos_type pubseekpos(pos_type sp,
ios_base::openmode which = ios_base::in | ios_base::out);
Returns: seekpos(sp, which).

int pubsputc();
Returns: sync().

29.6.3.2.3 Get area

streamsize in_avail();
Returns: If a read position is available, returns egptr() - gpdr(). Otherwise returns showmanyc() (29.6.3.4.3).

int_type snextc();
Effects: Calls sbumpc().
Returns: If that function returns traits::eof(), returns traits::eof(). Otherwise, returns sgetc().

int_type sbumpc();
Effects: If the input sequence read position is not available, returns uflow(). Otherwise, returns traits::to_int_type(*gpdr()) and increments the next pointer for the input sequence.

Returns: If the input sequence read position is not available, returns underflow(). Otherwise, returns traits::to_int_type(*gpdr()).

streamsize sgetn(char_type* s, streamsize n);
Returns: xsgetn(s, n).
29.6.3.2.4 Putback

`int_type sputbackc(char_type c);`

**Effects:** If the input sequence putback position is not available, or if `traits::eq(c, gptr()[-1])` is false, returns `pbackfail(traits::to_int_type(c))`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

`int_type sungetc();`

**Effects:** If the input sequence putback position is not available, returns `pbackfail()` otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

29.6.3.2.5 Put area

`int_type sputc(char_type c);`

**Effects:** If the output sequence write position is not available, returns `overflow(traits::to_int_type(c))`. Otherwise, stores `c` at the next pointer for the output sequence, increments the pointer, and returns `traits::to_int_type(c)`.

`streamsize sputn(const char_type* s, streamsize n);`

**Returns:** `xsputn(s, n)`.

29.6.3.3 Protected member functions

29.6.3.3.1 Assignment

`basic_streambuf& operator=(const basic_streambuf& rhs);`

**Postconditions:**

1. `eback() == rhs.eback()`
2. `gptr() == rhs.gptr()`
3. `egptr() == rhs.egptr()`
4. `pbase() == rhs.pbase()`
5. `pptr() == rhs.pptr()`
6. `epptr() == rhs.epptr()`
7. `getloc() == rhs.getloc()`

**Returns:** `*this`.

`void swap(basic_streambuf& rhs);`

**Effects:** Swaps the data members of `rhs` and `*this`.

29.6.3.3.2 Get area access

`char_type* eback() const;`

**Returns:** The beginning pointer for the input sequence.

`char_type* gptr() const;`

**Returns:** The next pointer for the input sequence.

`char_type* egptr() const;`

**Returns:** The end pointer for the input sequence.

`void gbump(int n);`

**Effects:** Adds `n` to the next pointer for the input sequence.

`void setg(char_type* gbeg, char_type* gnext, char_type* gend);`

**Postconditions:** `gbeg == eback()`, `gnext == gptr()`, and `gend == egptr()` are all true.
29.6.3.3 Put area access

char_type* pbase() const;
Returns: The beginning pointer for the output sequence.

char_type* pptr() const;
Returns: The next pointer for the output sequence.

char_type* epptr() const;
Returns: The end pointer for the output sequence.

void pbump(int n);
Effects: Adds \( n \) to the next pointer for the output sequence.

void setp(char_type* pbeg, char_type* pend);
Postconditions: \( \text{pbeg} == \text{pbase()} \), \( \text{pbeg} == \text{pptr()} \), and \( \text{pend} == \text{epptr()} \) are all true.

29.6.3.4 Virtual functions

29.6.3.4.1 Locales

void imbue(const locale&);
Effects: Change any translations based on locale.
Remarks: Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.
Default behavior: Does nothing.

29.6.3.4.2 Buffer management and positioning

basic_streambuf* setbuf(char_type* s, streamsize n);
Effects: Influences stream buffering in a way that is defined separately for each class derived from basic_streambuf in this Clause (29.8.2.4, 29.9.2.4).
Default behavior: Does nothing. Returns this.

pos_type seekoff(off_type off, ios_base::seekdir way,
ios_base::openmode which
= ios_base::in | ios_base::out);
Effects: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from basic_streambuf in this Clause (29.8.2.4, 29.9.2.4).
Default behavior: Returns pos_type(off_type(-1)).

pos_type seekpos(pos_type sp,
ios_base::openmode which
= ios_base::in | ios_base::out);
Effects: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from basic_streambuf in this Clause (29.8.2, 29.9.2).
Default behavior: Returns pos_type(off_type(-1)).

int sync();
Effects: Synchronizes the controlled sequences with the arrays. That is, if \( \text{pbase()} \) is non-null the characters between \( \text{pbase()} \) and \( \text{pptr()} \) are written to the controlled sequence. The pointers may then be reset as appropriate.
Returns: -1 on failure. What constitutes failure is determined by each derived class (29.9.2.4).
Default behavior: Returns zero.
29.6.3.4.3  Get area

streamsize showmanyc();

Returns: An estimate of the number of characters available in the sequence, or -1. If it returns a positive value, then successive calls to underflow() will not return traits::eof() until at least that number of characters have been extracted from the stream. If showmanyc() returns -1, then calls to underflow() or uflow() will fail.

Default behavior: Returns zero.

Remarks: Uses traits::eof().

streamsize xsgetn(char_type* s, streamsize n);

Effects: Assigns up to n characters to successive elements of the array whose first element is designated by s. The characters assigned are read from the input sequence as if by repeated calls to sbumpc(). Assigning stops when either n characters have been assigned or a call to sbumpc() would return traits::eof().

Returns: The number of characters assigned.

Remarks: Uses traits::eof().

int_type underflow();

Remarks: The public members of basic_streambuf call this virtual function only if gptr() is null or gptr() >= egptr().

Returns: traits::to_int_type(c), where c is the first character of the pending sequence, without moving the input sequence position past it. If the pending sequence is null then the function returns traits::eof() to indicate failure.

The pending sequence of characters is defined as the concatenation of

— the empty sequence if gptr() is null, otherwise the characters in [gptr(), egptr()), followed by

— some (possibly empty) sequence of characters read from the input sequence.

The result character is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

The backup sequence is the empty sequence if eback() is null, otherwise the characters in [eback(), gptr()).

Effects: The function sets up the gptr() and egptr() such that if the pending sequence is non-empty, then egptr() is non-null and the characters in [gptr(), egptr()) are the characters in the pending sequence, otherwise either gptr() is null or gptr() == egptr().

If eback() and gptr() are non-null then the function is not constrained as to their contents, but the usual backup condition” is that either

— the backup sequence contains at least gptr() - eback() characters, in which case the characters in [eback(), gptr()) agree with the last gptr() - eback() characters of the backup sequence, or

— the characters in [gptr() - n, gptr()) agree with the backup sequence (where n is the length of the backup sequence).

Default behavior: Returns traits::eof().

int_type uflow();

Preconditions: The constraints are the same as for underflow(), except that the result character is transferred from the pending sequence to the backup sequence, and the pending sequence is not empty before the transfer.

296) The morphemes of showmanyc are “es-how-many-see”, not “show-manic”.

297) underflow or uflow might fail by throwing an exception prematurely. The intention is not only that the calls will not return eof() but that they will return “immediately”.

298) Classes derived from basic_streambuf can provide more efficient ways to implement xsgetn() and xsputn() by overriding these definitions from the base class.
ISO/IEC JTC1 SC22 WG21 N4860

Default behavior: Calls underflow(). If underflow() returns traits::eof(), returns traits::eof(). Otherwise, returns the value of traits::to_int_type(*gptr()) and increment the value of the next pointer for the input sequence.

Returns: traits::eof() to indicate failure.

29.6.3.4.4 Putback

int_type pbackfail(int_type c = traits::eof());

Remarks: The public functions of basic_streambuf call this virtual function only when gptr() is null, gptr() == eback(), or traits::eq(traits::to_char_type(c), gptr()[−1]) returns false. Other calls shall also satisfy that constraint.

The pending sequence is defined as for underflow(), with the modifications that

(1.1) — If traits::eq_int_type(c, traits::eof()) returns true, then the input sequence is backed up one character before the pending sequence is determined.

(1.2) — If traits::eq_int_type(c, traits::eof()) returns false, then c is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

Postconditions: On return, the constraints of gptr(), eback(), and pptr() are the same as for underflow().

Returns: traits::eof() to indicate failure. Failure may occur because the input sequence could not be backed up, or if for some other reason the pointers could not be set consistent with the constraints.

pbackfail() is called only when put back has really failed.

Returns some value other than traits::eof() to indicate success.

Default behavior: Returns traits::eof().

29.6.3.4.5 Put area

streamsize xsputn(const char_type* s, streamsize n);

Effects: Writes up to n characters to the output sequence as if by repeated calls to sputc(c). The characters written are obtained from successive elements of the array whose first element is designated by s. Writing stops when either n characters have been written or a call to sputc(c) would return traits::eof(). It is unspecified whether the function calls overflow() when pptr() == eptr() becomes true or whether it achieves the same effects by other means.

Returns: The number of characters written.

int_type overflow(int_type c = traits::eof());

Effects: Consumes some initial subsequence of the characters of the pending sequence. The pending sequence is defined as the concatenation of

(3.1) — the empty sequence if pbase() is null, otherwise the pptr() - pbase() characters beginning at pbase(), followed by

(3.2) — the empty sequence if traits::eq_int_type(c, traits::eof()) returns true, otherwise the sequence consisting of c.

Remarks: The member functions sputc() and sputn() call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

Preconditions: Every overriding definition of this virtual function obeys the following constraints:

(5.1) — The effect of consuming a character on the associated output sequence is specified.299

(5.2) — Let r be the number of characters in the pending sequence not consumed. If r is nonzero then pbase() and pptr() are set so that: pptr() - pbase() == r and the r characters starting at pbase() are the associated output stream. In case r is zero (all characters of the pending sequence have been consumed) then either pbase() is set to nullptr, or pbase() and pptr() are both set to the same non-null value.

299) That is, for each class derived from an instance of basic_streambuf in this Clause (29.8.2, 29.9.2), a specification of how consuming a character effects the associated output sequence is given. There is no requirement on a program-defined class.
The function may fail if either appending some character to the associated output stream fails or if it is unable to establish \texttt{pbase()} and \texttt{pptr()} according to the above rules.

\textit{Returns:} \texttt{traits::eof()} or throws an exception if the function fails. Otherwise, returns some value other than \texttt{traits::eof()} to indicate success.\footnote{Typically, \texttt{overflow} returns \texttt{c} to indicate success, except when \texttt{traits::eq_int_type(c, traits::eof())} returns true, in which case it returns \texttt{traits::not_eof(c)}.}

\textit{Default behavior:} Returns \texttt{traits::eof()}.

29.7.4 Input streams

The header <istream> defines two types and a function signature that control input from a stream buffer along with a function template that extracts from stream rvalues.

29.7.4.1 Class template basic_istream

namespace std {

template<class charT, class traits = char_traits<charT>>
class basic_istream : virtual public basic_ios<charT, traits> {
public:
    // types (inherited from basic_ios (29.5.5))
    using char_type = charT;
    using int_type = typename traits::int_type;
    using pos_type = typename traits::pos_type;
    using off_type = typename traits::off_type;
    using traits_type = traits;

    // 29.7.4.1.1, constructor/destructor
    explicit basic_istream(basic_streambuf<charT, traits>** sb);
    virtual ~basic_istream();

    // 29.7.4.1.3, prefix/suffix
    class sentry;

    // 29.7.4.2, formatted input
    basic_istream<charT, traits>&
        >> (basic_istream<charT, traits>& (*pf)(basic_istream<charT, traits>&&));
    basic_istream<charT, traits>&
        >> (basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&&));
    basic_istream<charT, traits>&
        >> (ios_base& (*pf)(ios_base&));

    basic_istream<charT, traits>& operator>>(bool& n);
    basic_istream<charT, traits>& operator>>(short& n);
    basic_istream<charT, traits>& operator>>(unsigned short& n);
    basic_istream<charT, traits>& operator>>(int& n);
    basic_istream<charT, traits>& operator>>(unsigned int& n);
    basic_istream<charT, traits>& operator>>(long& n);

charT, traits&
& operator>>(basic_istream<

1 The class template basic_istream defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.
Two groups of member function signatures share common properties: the formatted input functions (or extractors) and the unformatted input functions. Both groups of input functions are described as if they obtain (or extract) input characters by calling \texttt{rdbuf()\textemdash\textasciitilde sbumpc()} or \texttt{rdbuf()\textemdash\textasciitilde sgetc()}. They may use other public members of \texttt{istream}.

If \texttt{rdbuf()\textemdash\textasciitilde sbumpc()} or \texttt{rdbuf()\textemdash\textasciitilde sgetc()} returns \texttt{traits\textemdash::eof()}, then the input function, except as explicitly noted otherwise, completes its actions and does \texttt{setstate(eofbit)}, which may throw \texttt{ios\textemdash base\textemdash::failure} (29.5.5.4), before returning.

If one of these called functions throws an exception, then unless explicitly noted otherwise, the input function sets \texttt{badbit} in the error state. If \texttt{badbit} is set in \texttt{exceptions()}, the input function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

### 29.7.4.1.1 Constructors

**explicit basic_istream(basic_streambuf<charT, traits>* sb);**

*Effects:* Initializes the base class subobject with \texttt{basic_ios\textemdash::init(sb)} (29.5.5.2).

*Postconditions:* \texttt{gcount()} == 0.

### 29.7.4.1.2 Assignment and swap

**basic_istream& operator=(basic_istream&& rhs);**

*Effects:* Equivalent to: \texttt{swap(rhs)}.

*Returns:* \*\texttt{this}.

### 29.7.4.1.3 Class basic_istream::sentry

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream<charT, traits>::sentry {
        bool ok_;  // exposition only
    public:
        explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false);
        ~sentry();
        explicit operator bool() const { return ok_; }
        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}
```

The class \texttt{sentry} defines a class that is responsible for doing exception safe prefix and suffix operations.

**explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false);**

*Effects:* If \texttt{is\textemdash good()} is \texttt{false}, calls \texttt{is\textemdash setstate(failbit)}. Otherwise, prepares for formatted or unformatted input. First, if \texttt{is\textemdash tie()} is not a null pointer, the function calls \texttt{is\textemdash tie()}\textemdash\textasciitilde\textasciitilde\textasciitilde flush() to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of \texttt{is\textemdash tie()} is empty. Further an implementation is allowed to defer the call to \texttt{flush} until a call of \texttt{is\textemdash rdbuf()\textemdash\textasciitilde\textasciitilde\textasciitilde underflow()} occurs. If no such call occurs before

§ 29.7.4.1.3 ©ISO/IEC 2020 – All rights reserved
the `sentry` object is destroyed, the call to `flush` may be eliminated entirely.\footnote{301} If `noskipws` is zero and `is.flags()` \& `ios_base::skipws` is nonzero, the function extracts and discards each character as long as the next available input character `c` is a whitespace character. If `is.rdbuf()->sbumpc()` or `is.rdbuf()->sgetc()` returns `traits::eof()`, the function calls `setstate(failbit | eofbit)` (which may throw `ios_base::failure`).

Remarks: The constructor

```cpp
explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false)
```

uses the currently imbued locale in `is`, to determine whether the next input character is whitespace or not.

To decide if the character `c` is a whitespace character, the constructor performs as if it executes the following code fragment:

```cpp
const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
    // c is a whitespace character.
```

If, after any preparation is completed, `is.good()` is `true`, \`ok_` is `false` otherwise, \`ok_` is `false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure`).\footnote{302}

```cpp
~sentry();
```

Effects: None.

```cpp
explicit operator bool() const;
```

Returns: `ok_`.

### 29.7.4.2 Formatted input functions

Each formatted input function begins execution by constructing an object of class `sentry` with the `noskipws` (second) argument `false`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is turned on\footnote{303} in `*this`’s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

### 29.7.4.2.2 Arithmetic extractors

```cpp
operator>>(unsigned short& val);
operator>>(unsigned int& val);
operator>>(long& val);
operator>>(unsigned long& val);
operator>>(long long& val);
operator>>(unsigned long long& val);
operator>>(float& val);
operator>>(double& val);
operator>>(long double& val);
operator>>(bool& val);
operator>>(void*& val);
```

As in the case of the inserter, these extractors depend on the locale’s `num_get<>` (28.4.2.1) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 29.7.4.2.1). After a `sentry` object is constructed, the conversion occurs as if performed by the following code fragment:

```cpp
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iosstate err = iostate::goodbit;
use_facet<numget>(loc).get(*this, 0, *this, err, val);
setstate(err);
```
In the above fragment, `loc` stands for the private member of the `basic_ios` class. [Note: The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. — end note] Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

```cpp
operator>>(short& val);
```

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```cpp
class num_get{
public:
    using iterator = istreambuf_iterator<charT,traits>;
    template<class CharT>
    static bool extract(CharT& ch, const CharT*, CharT*);
    static bool extract(CharT& ch, CharT*, CharT*);
private:
    int extract(CharT& ch, const CharT*, CharT*);
    int extract(CharT& ch, CharT*, CharT*);
}
```

```cpp
iostate err = ios_base::goodbit;
long lval;
use_facet<num_get<charT, istreambuf_iterator<charT, traits>>>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<short>::min()) {
    err |= ios_base::failbit;
    val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
    err |= ios_base::failbit;
    val = numeric_limits<short>::max();
} else
    val = static_cast<short>(lval);
setstate(err);
```

```cpp
operator>>(int& val);
```

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```cpp
iostate err = ios_base::goodbit;
long lval;
use_facet<num_get<charT, istreambuf_iterator<charT, traits>>>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<int>::min()) {
    err |= ios_base::failbit;
    val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
    err |= ios_base::failbit;
    val = numeric_limits<int>::max();
} else
    val = static_cast<int>(lval);
setstate(err);
```

---

304 See, for example, the function signature `ws(basic_istream&)` (29.7.4.4).
305 See, for example, the function signature `dec(ios_base&)` (29.5.6.3).
template<class charT, class traits, size_t N>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);

Effects: Behaves like a formatted input member (as described in 29.7.4.2.1) of in. After a sentry object is constructed, \( \text{operator}>> \) extracts characters and stores them into \( s \). If \( \text{width}() \) is greater than zero, \( n \) is \( \min(\text{size}_T(\text{width}()), N) \). Otherwise \( n \) is \( N \). \( n \) is the maximum number of characters stored.

Characters are extracted and stored until any of the following occurs:

- (8.1) \( n-1 \) characters are stored;
- (8.2) end of file occurs on the input sequence;
- (8.3) \( \text{operator}>> \) then stores a null byte (\( \text{charT}() \)) in the next position, which may be the first position if no characters were extracted. \( \text{operator}>> \) then calls \( \text{width}(0) \).

If the function extracted no characters, it calls \( \text{setState(failbit)} \), which may throw \( \text{ios_base::failure} \) (29.5.5.4).

Returns: \( \text{in} \).

template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);

Effects: Behaves like a formatted input member (as described in 29.7.4.2.1) of \( \text{in} \). After a sentry object is constructed a character is extracted from \( \text{in} \), if one is available, and stored in \( c \). Otherwise, the function calls \( \text{in.setstate(failbit)} \).

Returns: \( \text{in} \).

template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);

Effects: Behaves as an unformatted input function (29.7.4.3). If \( \text{sb} \) is null, calls \( \text{setState(failbit)} \), which may throw \( \text{ios_base::failure} \) (29.5.5.4). After a sentry object is constructed, extracts characters from *this and inserts them in the output sequence controlled by \( \text{sb} \). Characters are extracted and inserted until any of the following occurs:

- (14.1) end-of-file occurs on the input sequence;
- (14.2) inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (14.3) an exception occurs (in which case the exception is caught).

If the function inserts no characters, it calls \( \text{setState(failbit)} \), which may throw \( \text{ios_base::failure} \) (29.5.5.4). If it inserted no characters because it caught an exception thrown while extracting characters from *this and failbit is set in exceptions() (29.5.5.4), then the caught exception is rethrown.

Returns: *this.

29.7.4.3 Unformatted input functions

Each unformatted input function begins execution by constructing an object of class sentry with the default argument noskipws (second) argument true. If the sentry object returns true, when converted to a value of type bool, the function endeavors to obtain the requested input. Otherwise, if the sentry constructor exits by throwing an exception or if the sentry object returns false, when converted to a value of type bool, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using charT()) in the first location of the array. If an exception is thrown during input then
ios_base::badbit is turned on in *this's error state. (Exceptions thrown from basic_ios<>::clear() are not caught or rethrown.) If (exceptions()&badbit) != 0 then the exception is rethrown. It also counts the number of characters extracted. If no exception has been thrown it ends by storing the count in a member object and returning the value specified. In any event the sentry object is destroyed before leaving the unformatted input function.

streamsize gcount() const;
Effects: None. This member function does not behave as an unformatted input function (as described above).
Returns: The number of characters extracted by the last unformatted input member function called for the object.

int_type get();
Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts a character c, if one is available. Otherwise, the function calls setstate(failbit), which may throw ios_base::failure (29.5.5.4).
Returns: c if available, otherwise traits::eof().

basic_istream<charT, traits>& get(char_type& c);
Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts a character c, if one is available, and assigns it to c. Otherwise, the function calls setstate(failbit) (which may throw ios_base::failure (29.5.5.4)).
Returns: *this.

basic_istream<charT, traits>& get(char_type* s, streamsize n, char_type delim);
Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and stores them into successive locations of an array whose first element is designated by s. Characters are extracted and stored until any of the following occurs:
- n is less than one or n - 1 characters are stored;
- end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit));
- traits::eq(c, delim) for the next available input character c (in which case c is not extracted).
If the function stores no characters, it calls setstate(failbit) (which may throw ios_base::failure (29.5.5.4)). In any case, if n is greater than zero it then stores a null character into the next successive location of the array.
Returns: *this.

basic_istream<charT, traits>& get(char_type* s, streamsize n);
Effects: Calls get(s, n, widen('\n')).
Returns: Value returned by the call.

basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb, char_type delim);
Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and inserts them in the output sequence controlled by sb. Characters are extracted and inserted until any of the following occurs:
- end-of-file occurs on the input sequence;
- inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- traits::eq(c, delim) for the next available input character c (in which case c is not extracted);
- an exception occurs (in which case, the exception is caught but not rethrown).
If the function inserts no characters, it calls setstate(failbit), which may throw ios_base::failure (29.5.5.4).

---

306 This is done without causing an ios_base::failure to be thrown.
307 Note that this function is not overloaded on types signed char and unsigned char.
308 Note that this function is not overloaded on types signed char and unsigned char.
Returns: *this.

basic_istream<
T, traits>& get(basic_streambuf<
char_type, traits>& sb);

Effects: Calls get(sb, widen(’\n’)).

Returns: Value returned by the call.

basic_istream<
T, traits>& getline(char_type* s, streamsize n, char_type delim);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry
object, extracts characters and stores them into successive locations of an array whose first element is
designated by s.309 Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit));
2. traits::eq(c, delim) for the next available input character c (in which case the input character
   is extracted but not stored);310
3. n is less than one or n - 1 characters are stored (in which case the function calls setstate(
   failbit)).

These conditions are tested in the order shown.311

If the function extracts no characters, it calls setstate(failbit) (which may throw ios_base::
failure (29.5.5.4)).312

In any case, if n is greater than zero, it then stores a null character (using charT()) into the next
successive location of the array.

Returns: *this.

[Example:

```c++
#include <iostream>

int main() {
    using namespace std;
    const int line_buffer_size = 100;

    char buffer[line_buffer_size];
    int line_number = 0;
    while (cin.getline(buffer, line_buffer_size, ’\n’) || cin.gcount()) {
        int count = cin.gcount();
        if (cin.eof())
            cout << "Partial final line";
        else if (cin.fail()) {
            cout << "Partial long line";
            cin.clear(cin.rdstate() & ~ios_base::failbit);
        } else {
            count--;
            cout << "Line " << ++line_number;
            cout << " (" << count << " chars): " << buffer << endl;
        }
    } // Don’t include newline in count

    basic_istream<
T, traits>& getline(char_type* s, streamsize n);

Returns: getline(s, n, widen(’\n’))
```

309) Note that this function is not overloaded on types signed char and unsigned char.
310) Since the final input character is “extracted”, it is counted in the gcount(), even though it is not stored.
311) This allows an input line which exactly fills the buffer, without setting failbit. This is different behavior than the historical
    AT&T implementation.
312) This implies an empty input line will not cause failbit to be set.

§ 29.7.4.3 ©ISO/IEC 2020 – All rights reserved 1391
basic_istream<charT, traits>& ignore(streamsize n = 1, int_type delim = traits::eof());

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and discards them. Characters are extracted until any of the following occurs:
(25.1) n != numeric_limits<streamsize>::max() (17.3.5) and n characters have been extracted so far
(25.2) end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit), which may throw ios_base::failure (29.5.5.4));
(25.3) traits::eq_int_type(traits::to_int_type(c), delim) for the next available input character c (in which case c is extracted).

Remarks: The last condition will never occur if traits::eq_int_type(delim, traits::eof()).

Returns: *this.

int_type peek();

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, reads but does not extract the current input character.

Returns: traits::eof() if good() is false. Otherwise, returns rdbuf()->sgetc().

basic_istream<charT, traits>& read(char_type* s, streamsize n);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s. Characters are extracted and stored until either of the following occurs:
(30.1) n characters are stored;
(30.2) end-of-file occurs on the input sequence (in which case the function calls setstate(failbit | eofbit), which may throw ios_base::failure (29.5.5.4)).

Returns: *this.

streamsize readsome(char_type* s, streamsize n);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s. If rdbuf()->in_avail() == -1, calls setstate(eofbit) (which may throw ios_base::failure (29.5.5.4)), and extracts no characters;
(32.1) If rdbuf()->in_avail() == 0, extracts no characters
(32.2) If rdbuf()->in_avail() > 0, extracts min(rdbuf()->in_avail(), n)).

Returns: The number of characters extracted.

basic_istream<charT, traits>& putback(char_type c);

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sputbackc(c). If rdbuf() is null, or if sputbackc returns traits::eof(), calls setstate(badbit) (which may throw ios_base::failure (29.5.5.4)). [Note: This function extracts no characters, so the value returned by the next call to gcount() is 0. — end note]

Returns: *this.

basic_istream<charT, traits>& unget();

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sungetc(). If rdbuf()
is null, or if `sungetc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure (29.5.5.4)`). [Note: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — end note]

37

Returns: *this.

```cpp
int sync();
```

38

Effects: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `rdbuf()` is a null pointer, returns -1. Otherwise, calls `rdbuf()->pubsync()` and, if that function returns -1 calls `setstate(badbit)` (which may throw `ios_base::failure (29.5.5.4)`), and returns -1. Otherwise, returns zero.

```cpp
pos_type tellg();
```

39

Effects: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`.

40

Returns: After constructing a sentry object, if `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, in)`.

```cpp
basic_istream<charT, traits>& seekg(pos_type pos);
```

41

Effects: Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `fail() != true`, executes `rdbuf()->pubseekoff(0, dir, in)`.

```cpp
basic_istream<charT, traits>& seekg(off_type off, ios_base::seekdir dir);
```

42

Effects: Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, in)`.

29.7.4.4 Standard basic_istream manipulators [istream.manip]

1 Each instantiation of the function template specified in this subclause is a designated addressable function (16.5.4.2.1).

```cpp
template<class charT, class traits>
basic_istream<charT, traits>&& ws(basic_istream<charT, traits>&& is);
```

2 Effects: Behaves as an unformatted input function (29.7.4.3), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `is.gcount()`. After constructing a sentry object extracts characters as long as the next available character is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by `sentry::sentry` (29.7.4.1.3). If `ws` stops extracting characters because there are no more available it sets `eofbit`, but not `failbit`.

```cpp
Returns: is.
```

29.7.4.5 Rvalue stream extraction [istream.rvalue]

```cpp
template<class Istream, class T>
Istream&& operator>>(Istream&& is, T&& x);
```

1 Constraints: The expression `is >> std::forward<T>(x)` is well-formed when treated as an unevaluated operand and `Istream` is publicly and unambiguously derived from `ios_base`.

2 Effects: Equivalent to:

```cpp
is >> std::forward<T>(x);
```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_iostream
        : public basic_istream<charT, traits>,
        public basic_ostream<charT, traits> {

  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, wchar_t) = delete;

template<class traits>
  basic_ostream<wchar_t, traits>& operator<<(basic_ostream<wchar_t, traits>&, char8_t) = delete;

template<class traits>
  basic_ostream<wchar_t, traits>& operator<<(basic_ostream<wchar_t, traits>&, char16_t) = delete;

template<class traits>
  basic_ostream<wchar_t, traits>& operator<<(basic_ostream<wchar_t, traits>&, char32_t) = delete;

template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, const charT*);

template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, const char8_t*);
template<class traits>
    basic_ostream<wchar_t, traits>&
    operator<<(basic_ostream<wchar_t, traits>&, const char32_t*) = delete;

The class template basic_ostream defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.

Two groups of member function signatures share common properties: the formatted output functions (or inserters) and the unformatted output functions. Both groups of output functions generate (or insert) output characters by actions equivalent to calling rdbuf()->sputc(int_type). They may use other public members of basic_ostream except that they shall not invoke any virtual members of rdbuf() except overflow(), xsputn(), and sync().

If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets badbit in the error state. If badbit is set in exceptions(), the output function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

[Note: The deleted overloads of operator<< prevent formatting characters as integers and strings as pointers. — end note]

29.7.5.1.1 Constructors

explicit basic_ostream(basic_streambuf<charT, traits>* sb);
1 Effects: Initializes the base class subobject with basic_ios<charT, traits>::init(sb) (29.5.5.2).
2 Postconditions: rdbuf() == sb.

basic_ostream(basic_ostream&& rhs);
3 Effects: Move constructs from the rvalue rhs. This is accomplished by default constructing the base class and calling basic_ios<charT, traits>::move(rhs) to initialize the base class.
4 virtual ~basic_ostream();
5 Remarks: Does not perform any operations on rdbuf().

29.7.5.1.2 Assignment and swap

basic_ostream& operator=(basic_ostream&& rhs);
1 Effects: Equivalent to: swap(rhs).
2 Returns: *this.

void swap(basic_ostream& rhs);
3 Effects: Calls basic_ios<charT, traits>::swap(rhs).

29.7.5.1.3 Class basic_ostream::sentry

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream<charT, traits>::sentry {
        bool ok_; // exposition only
    public:
        explicit sentry(basic_ostream<charT, traits>& os);
        ~sentry();
        explicit operator bool() const { return ok_; }
        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}
1 The class sentry defines a class that is responsible for doing exception safe prefix and suffix operations.

§ 29.7.5.1.3 ©ISO/IEC 2020 – All rights reserved 1397
explicit sentry(basic_ostream<charT, traits>& os);

If os.good() is nonzero, prepares for formatted or unformatted output. If os.tie() is not a null pointer, calls os.tie()->flush(). If, after any preparation is completed, os.good() is true, ok_ == true otherwise, ok_ == false. During preparation, the constructor may call setstate(failbit) (which may throw ios_base::failure (29.5.5.4)).

sentry();

If (os.flags() & ios_base::unitbuf) && !uncaught_exceptions() && os.good() is true, calls os.rdbuf()->pubsync(). If that function returns -1, sets badbit in os.rdstate() without propagating an exception.

explicit operator bool() const;

Effects: Returns ok_.

29.7.5.1.4 Seek members

Each seek member function begins execution by constructing an object of class sentry. It returns by destroying the sentry object.

pos_type tellp();

Returns: If fail() != false, returns pos_type(-1) to indicate failure. Otherwise, returns rdbuf()->pubseekoff(0, cur, out).

basic_ostream<charT, traits>& seekp(pos_type pos);

Effects: If fail() != true, executes rdbuf()->pubseekpos(pos, ios_base::out). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

Returns: *this.

basic_ostream<charT, traits>& seekp(off_type off, ios_base::seekdir dir);

Effects: If fail() != true, executes rdbuf()->pubseekoff(off, dir, ios_base::out). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

Returns: *this.

29.7.5.2 Formatted output functions

29.7.5.2.1 Common requirements

Each formatted output function begins execution by constructing an object of class sentry. If this object returns true when converted to a value of type bool, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does setstate(ios_base::failbit), which might throw an exception. If an exception is thrown during output, then ios_base::badbit is turned on in *this’s error state. If (exceptions()&badbit) != 0 then the exception is rethrown. Whether or not an exception is thrown, the sentry object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is *this.

The descriptions of the individual formatted output functions describe how they perform output and do not mention the sentry object.

If a formatted output function of a stream os determines padding, it does so as follows. Given a charT character sequence seq where charT is the character type of the stream, if the length of seq is less than os.width(), then enough copies of os.fill() are added to this sequence as necessary to pad to a width of os.width() characters. If (os.flags() & ios_base::adjustfield) == ios_base::left is true, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

29.7.5.2.2 Arithmetic inserters

operator<<(bool val);
operator<<(short val);

314) The call os.tie()->flush() does not necessarily occur if the function can determine that no synchronization is necessary.
315) The sentry constructor and destructor can also perform additional implementation-dependent operations.
316) without causing an ios_base::failure to be thrown.
1 Effects: The classes \texttt{num\_get<>} and \texttt{num\_put<>} handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued \texttt{locale} value to perform numeric formatting. When \texttt{val} is of type \texttt{bool, long, unsigned long, long long, unsigned long long, double, long double, or \texttt{const void*}}, the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<br>
    num\_put<charT, ostreambuf\_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(), val).failed();
```

When \texttt{val} is of type \texttt{short} the formatting conversion occurs as if it performed the following code fragment:

```cpp
ios\_base::fmtflags baseflags = ios\_base::flags() & ios\_base::basefield;
bool failed = use\_facets<br>
    num\_put<charT, ostreambuf\_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
    baseflags == ios\_base::oct || baseflags == ios\_base::hex
    ? static\_cast<long>(static\_cast<unsigned short>(val))
    : static\_cast<long>(val)).failed();
```

When \texttt{val} is of type \texttt{int} the formatting conversion occurs as if it performed the following code fragment:

```cpp
ios\_base::fmtflags baseflags = ios\_base::flags() & ios\_base::basefield;
bool failed = use\_facets<br>
    num\_put<charT, ostreambuf\_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
    baseflags == ios\_base::oct || baseflags == ios\_base::hex
    ? static\_cast<long>(static\_cast<unsigned int>(val))
    : static\_cast<long>(val)).failed();
```

When \texttt{val} is of type \texttt{unsigned short} or \texttt{unsigned int} the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use\_facets<br>
    num\_put<charT, ostreambuf\_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
    static\_cast<unsigned long>(val)).failed();
```

When \texttt{val} is of type \texttt{float} the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use\_facets<br>
    num\_put<charT, ostreambuf\_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
    static\_cast<double>(val)).failed();
```

The first argument provides an object of the \texttt{ostreambuf\_iterator<>} class which is an iterator for class \texttt{basic\_ostream<>.} It bypasses \texttt{ostreams} and uses \texttt{streambufs} directly. Class \texttt{locale} relies on these types as its interface to iostreams, since for flexibility it has been abstracted away from direct dependence on \texttt{ostream}. The second parameter is a reference to the base class subobject of type \texttt{ios\_base}. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If \texttt{failed} is \texttt{true} then does \texttt{setstate(badbit)}, which may throw an exception, and returns.

3 Returns: \texttt{*this}.
29.7.5.2.3 basic_ostream::operator<< [ostream.inserters]

basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& (*pf)(basic_ostream<charT, traits>&&));
1 Effects: None. Does not behave as a formatted output function (as described in 29.7.5.2.1).
2 Returns: pf(*this).317

basic_ostream<charT, traits>&
operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&&));
3 Effects: Calls pf(*this). This inserter does not behave as a formatted output function (as described
4 in 29.7.5.2.1).
5 Returns: *this.318

basic_ostream<charT, traits>& operator<<(ios_base& (*pf)(ios_base&));
6 Effects: Calls pf(*this). This inserter does not behave as a formatted output function (as described
7 in 29.7.5.2.1).
8 Returns: *this.

basic_ostream<charT, traits>& operator<<(basic_streambuf<charT, traits>* sb);
9 Effects: Behaves as an unformatted output function (29.7.5.3). After the sentry object is constructed,
10 if sb is null calls setstate(badbit) (which may throw ios_base::failure).
11 Gets characters from sb and inserts them in *this. Characters are read from sb and inserted until any
12 of the following occurs:
13 — end-of-file occurs on the input sequence;
14 — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
15 — an exception occurs while getting a character from sb.
16 If the function inserts no characters, it calls setstate(failbit) (which may throw ios_base::failure(29.5.5.4)). If an exception was thrown while extracting a character, the function sets failbit
17 in the error state, and if failbit is set in exceptions() the caught exception is rethrown.
18 Returns: *this.

basic_ostream<charT, traits>& operator<<(nullptr_t);
19 Effects: Equivalent to:
20 return *this << s;
21 where s is an implementation-defined NTCTS (16.3.18).

29.7.5.2.4 Character inserter function templates [ostream.inserters.character]

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);
1 Effects: Behaves as a formatted output function (29.7.5.2.1) of out. Constructs a character sequence
seq. If c has type char and the character type of the stream is not char, then seq consists of
out.widen(c); otherwise seq consists of c. Determines padding for seq as described in 29.7.5.2.1. Inserts seq into out. Calls os.width(0).
2 template<charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, char c);
3 template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, signed char c);
4 template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, unsigned char c);
5

317) See, for example, the function signature endl(basic_ostream&) (29.7.5.4).
318) See, for example, the function signature dec(ios_base&) (29.5.6.3).
Returns: out.

```
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT* s);
```

```
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const char* s);
```

```
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char* s);
```

```
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const signed char* s);
```

```
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const unsigned char* s);
```

Preconditions: s is not a null pointer.

Effects: Behaves like a formatted inserter (as described in 29.7.5.2.1) of out. Creates a character sequence seq of n characters starting at s, each widened using `out.widen()` (29.5.5.3), where n is the number that would be computed as if by:

1. `traits::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const charT*`, and also for the overload where the first argument is of type `basic_ostream<char, traits>&` and the second is of type `const char*`,
2. `char_traits<char>::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const char*`,
3. `traits::length(reinterpret_cast<const char*>(s))` for the other two overloads.

Determines padding for seq as described in 29.7.5.2.1. Inserts seq into out. Calls `width(0)`.

Returns: out.

29.7.5.3 Unformatted output functions

Each unformatted output function begins execution by constructing an object of class `sentry`. If this object returns `true`, while converting to a value of type `bool`, the function endeavors to generate the requested output. If an exception is thrown during output, then `ios_base::badbit` is turned on in `*this`’s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. In any case, the unformatted output function ends by destroying the sentry object, then, if no exception was thrown, returning the value specified for the unformatted output function.

```
basic_ostream<charT, traits>& put(char_type c);
```

Effects: Behaves as an unformatted output function (as described above). After constructing a sentry object, inserts the character c, if possible. Otherwise, calls `setstate(badbit)` (which may throw `ios_base::failure` (29.5.5.4)).

Returns: `*this`.

```
basic_ostream& write(const char_type* s, streamsize n);
```

Effects: Behaves as an unformatted output function (as described above). After constructing a sentry object, obtains characters to insert from successive locations of an array whose first element is designated by s. Characters are inserted until either of the following occurs:

1. n characters are inserted;
2. inserting in the output sequence fails (in which case the function calls `setstate(badbit)`, which may throw `ios_base::failure` (29.5.5.4)).

Returns: `*this`.

```
basic_ostream& flush();
```

Effects: Behaves as an unformatted output function (as described above). If `rdbuf()` is not a null pointer, constructs a sentry object. If this object returns `true` when converted to a value of type `bool`...
the function calls rdbuf()->pubsync(). If that function returns -1 calls setstate(badbit) (which may throw ios_base::failure (29.5.5.4)). Otherwise, if the sentry object returns false, does nothing.

Returns: *this.

29.7.5.4 Standard manipulators

Each instantiation of any of the function templates specified in this subclause is a designated addressable function (16.5.4.2.1).

```
template<class charT, class traits>
  basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>&& os);

Effects: Calls os.put(os.widen('\n')), then os.flush().

Returns: os.
```

```
template<class charT, class traits>
  basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>&& os);

Effects: Inserts a null character into the output sequence: calls os.put(charT()).

Returns: os.
```

```
template<class charT, class traits>
  basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>&& os);

Effects: Calls os.flush().

Returns: os.
```

```
template<class charT, class traits>
  basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>&& os);

Effects: If os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*; called buf for the purpose of exposition, calls buf->set_emit_on_sync(true). Otherwise this manipulator has no effect. [Note: To work around the issue that the Allocator template argument cannot be deduced, implementations can introduce an intermediate base class to basic_syncbuf that manages its emit_on_sync flag. — end note]

Returns: os.
```

```
template<class charT, class traits>
  basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>&& os);

Effects: If os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*; called buf for the purpose of exposition, calls buf->set_emit_on_sync(false). Otherwise this manipulator has no effect.

Returns: os.
```

```
template<class charT, class traits>
  basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>&& os);

Effects: Calls os.flush(). Then, if os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*; called buf for the purpose of exposition, calls buf->emit().

Returns: os.
```

29.7.5.5 Rvalue stream insertion

```
template<class Ostream, class T>
  Ostream&& operator<<(Ostream&& os, const T& x);

Constraints: The expression os << x is well-formed when treated as an unevaluated operand and Ostream is publicly and unambiguously derived from ios_base.

Effects: As if by: os << x;

Returns: std::move(os).
```

29.7.6 Standard manipulators

The header <iomanip> defines several functions that support extractors and inserters that alter information maintained by class ios_base and its derived classes.
unspecified resetiosflags(ios_base::fmtflags mask);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << resetiosflags(mask) behaves as if it called f(out, mask), or if in is an object of type basic_istream<charT, traits> then the expression in >> resetiosflags(mask) behaves as if it called f(in, mask), where the function f is defined as:322

```cpp
void f(ios_base& str, ios_base::fmtflags mask) {
  // reset specified flags
  str.setf(ios_base::fmtflags(0), mask);
}
```

The expression out << resetiosflags(mask) has type basic_ostream<charT, traits>& and value out. The expression in >> resetiosflags(mask) has type basic_istream<charT, traits>& and value in.

unspecified setiosflags(ios_base::fmtflags mask);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setiosflags(mask) behaves as if it called f(out, mask), or if in is an object of type basic_istream<charT, traits> then the expression in >> setiosflags(mask) behaves as if it called f(in, mask), where the function f is defined as:

```cpp
void f(ios_base& str, ios_base::fmtflags mask) {
  // set specified flags
  str.setf(mask);
}
```

The expression out << setiosflags(mask) has type basic_ostream<charT, traits>& and value out. The expression in >> setiosflags(mask) has type basic_istream<charT, traits>& and value in.

unspecified setbase(int base);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setbase(base) behaves as if it called f(out, base), or if in is an object of type basic_istream<charT, traits> then the expression in >> setbase(base) behaves as if it called f(in, base), where the function f is defined as:

```cpp
void f(ios_base& str, int base) {
  // set basefield
  str.setf(base == 8 ? ios_base::oct :
            base == 10 ? ios_base::dec :
            base == 16 ? ios_base::hex :
                          ios_base::fmtflags(0), ios_base::basefield);
}
```

The expression out << setbase(base) has type basic_ostream<charT, traits>& and value out. The expression in >> setbase(base) has type basic_istream<charT, traits>& and value in.

unspecified setfill(char_type c);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> and c has type charT then the expression out << setfill(c) behaves as if it called f(out, c), where the function f is defined as:

```cpp
template<class charT, class traits>
void f(basic_ostream<charT, traits>& str, charT c) {
  // set fill character
  str.fill(c);
}
```

The expression out << setfill(c) has type basic_ostream<charT, traits>& and value out.

322) The expression cin >> resetiosflags(ios_base::skipws) clears ios_base::skipws in the format flags stored in the basic_istream<charT, traits> object cin (the same as cin >> noskipws), and the expression cout << resetiosflags(ios_base::showbase) clears ios_base::showbase in the format flags stored in the basic_ostream<charT, traits> object cout (the same as cout << noshowbase).
unspecified setprecision(int n);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setprecision(n) behaves as if it called f(out, n), or if in is an object of type basic_istream<charT, traits> then the expression in >> setprecision(n) behaves as if it called f(in, n), where the function f is defined as:

void f(ios_base& str, int n) {
    // set precision
    str.precision(n);
}

The expression out << setprecision(n) has type basic_ostream<charT, traits>& and value out. The expression in >> setprecision(n) has type basic_istream<charT, traits>& and value in.

unspecified setw(int n);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setw(n) behaves as if it called f(out, n), or if in is an object of type basic_istream<charT, traits> then the expression in >> setw(n) behaves as if it called f(in, n), where the function f is defined as:

void f(ios_base& str, int n) {
    // set width
    str.width(n);
}

The expression out << setw(n) has type basic_ostream<charT, traits>& and value out. The expression in >> setw(n) has type basic_istream<charT, traits>& and value in.

29.7.7 Extended manipulators [ext.manip]

The header <iomanip> defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);

Mandates: The type moneyT is either long double or a specialization of the basic_string template (Clause 21).

Effects: The expression in >> get_money(mon, intl) described below behaves as a formatted input function (29.7.4.2.1).

Returns: An object of unspecified type such that if in is an object of type basic_istream<charT, traits> then the expression in >> get_money(mon, intl) behaves as if it called f(in, mon, intl), where the function f is defined as:

template<class charT, class traits, class moneyT>
void f(basic_ios_base<traits>& str, moneyT& mon, bool intl) {
    using Iter = istreambuf_iterator<charT, traits>;
    using MoneyGet = money_get<charT, Iter>;
    ios_base::iostate err = ios_base::goodbit;
    const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());
    mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);
    if (ios_base::goodbit != err)
        str.setstate(err);
}

The expression in >> get_money(mon, intl) has type basic_istream<charT, traits>& and value in.

template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);

Mandates: The type moneyT is either long double or a specialization of the basic_string template (Clause 21).
Returns: An object of unspecified type such that if \texttt{out} is an object of type `basic_ostream<charT, traits>` then the expression \texttt{out << put_money(mon, intl)} behaves as a formatted output function (29.7.5.2.1) that calls \texttt{f(out, mon, intl)}, where the function \texttt{f} is defined as:

\begin{verbatim}
 template<class charT, class traits, class moneyT>
 void f(basic_ios<charT, traits>& str, const moneyT& mon, bool intl) {
     using Iter = ostreambuf_iterator<charT, traits>;
     using MoneyPut = money_put<charT, Iter>;
     const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
     const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);
     if (end.failed())
         str.setstate(ios_base::badbit);
 }
\end{verbatim}

The expression \texttt{out << put_money(mon, intl)} has type `basic_ostream<charT, traits>&` and value \texttt{out}.

\begin{verbatim}
 template<class charT> unspecified get_time(struct tm* tmb, const charT* fmt);
\end{verbatim}

Preconditions: The argument \texttt{tmb} is a valid pointer to an object of type `struct tm`, and \texttt{[fmt, fmt + char_traits<charT>::length(fmt)]} is a valid range.

Returns: An object of unspecified type such that if \texttt{in} is an object of type `basic_istream<charT, traits>` then the expression \texttt{in >> get_time(tmb, fmt)} behaves as if it called \texttt{f(in, tmb, fmt)}, where the function \texttt{f} is defined as:

\begin{verbatim}
 template<class charT, class traits>
 void f(basic_ios<charT, traits>& str, struct tm* tmb, const charT* fmt) {
     using Iter = istreambuf_iterator<charT, traits>;
     using TimeGet = time_get<charT, Iter>;
     ios_base::iostate err = ios_base::goodbit;
     const TimeGet& tg = use_facet<TimeGet>(str.getloc());
     tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb,
            fmt, fmt + traits::length(fmt));
     if (err != ios_base::goodbit)
         str.setstate(err);
 }
\end{verbatim}

The expression \texttt{in >> get_time(tmb, fmt)} has type `basic_istream<charT, traits>&` and value \texttt{in}.

\begin{verbatim}
 template<class charT> unspecified put_time(const struct tm* tmb, const charT* fmt);
\end{verbatim}

Preconditions: The argument \texttt{tmb} is a valid pointer to an object of type `struct tm`, and \texttt{[fmt, fmt + char_traits<charT>::length(fmt)]} is a valid range.

Returns: An object of unspecified type such that if \texttt{out} is an object of type `basic_ostream<charT, traits>` then the expression \texttt{out << put_time(tmb, fmt)} behaves as if it called \texttt{f(out, tmb, fmt)}, where the function \texttt{f} is defined as:

\begin{verbatim}
 template<class charT, class traits>
 void f(basic_ios<charT, traits>& str, const struct tm* tmb, const charT* fmt) {
     using Iter = ostreambuf_iterator<charT, traits>;
     using TimePut = time_put<charT, Iter>;
     const TimePut& tp = use_facet<TimePut>(str.getloc());
     const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
                            fmt, fmt + traits::length(fmt));
     if (end.failed())
         str.setstate(ios_base::badbit);
 }
\end{verbatim}
The expression \texttt{out $\ll$ put\_time(tmb, fmt)} has type \texttt{basic\_ostream<charT, traits>&} and value \texttt{out}. 

### 29.7.8 Quoted manipulators [quoted.manip]

1. [*Note: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O. — end note*]

   \begin{verbatim}
   template<class charT>
   unspecified quoted(const charT* s, charT delim = charT('"'), charT escape = charT('\'));
   template<class charT, class traits, class Allocator>
   unspecified quoted(const basic_string<charT, traits, Allocator>& s, charT delim = charT('"'), charT escape = charT('\'));
   template<class charT, class traits>
   unspecified quoted(basic_string_view<charT, traits> s, charT delim = charT('"'), charT escape = charT('\'));
   \end{verbatim}

   Returns: An object of unspecified type such that if \texttt{out} is an instance of \texttt{basic\_ostream} with member type \texttt{char\_type} the same as \texttt{charT} and with member type \texttt{traits\_type}, which in the second and third forms is the same as \texttt{traits}, then the expression \texttt{out $\ll$ quoted(s, delim, escape)} behaves as a formatted output function (29.7.5.2.1) of \texttt{out}. This forms a character sequence \texttt{seq}, initially consisting of the following elements:

   1. \texttt{delim}.
   2. Each character in \texttt{s}. If the character to be output is equal to \texttt{escape} or \texttt{delim}, as determined by \texttt{traits\_type::eq}, first output \texttt{escape}.
   3. \texttt{delim}.

   Let \texttt{x} be the number of elements initially in \texttt{seq}. Then padding is determined for \texttt{seq} as described in 29.7.5.2.1, \texttt{seq} is inserted as if by calling \texttt{out.rdbuf()$\rightarrow$sputn(seq, n)}, where \texttt{n} is the larger of \texttt{out.width()} and \texttt{x}, and \texttt{out.width(0)} is called. The expression \texttt{out $\ll$ quoted(s, delim, escape)} has type \texttt{basic\_ostream<charT, traits>&} and value \texttt{out}.

   \begin{verbatim}
   template<class charT, class traits, class Allocator>
   unspecified quoted(basic_string<charT, traits, Allocator>& s, charT delim = charT('"'), charT escape = charT('\'));
   \end{verbatim}

   Returns: An object of unspecified type such that:

   1. If \texttt{in} is an instance of \texttt{basic\_istream} with member types \texttt{char\_type} and \texttt{traits\_type} the same as \texttt{charT} and \texttt{traits}, respectively, then the expression \texttt{in $\gg$ quoted(s, delim, escape)} behaves as if it extracts the following characters from \texttt{in} using \texttt{operator>>(basic\_istream<charT, traits>&, charT&)} (29.7.4.2.3) which may throw \texttt{ios\_base::failure} (29.5.3.1.1):

   1.1 If the first character extracted is equal to \texttt{delim}, as determined by \texttt{traits\_type::eq}, then:

   1.1.1 Turn off the \texttt{skipws} flag.
   1.1.2 \texttt{s.clear()}
   1.1.3 Until an unescaped \texttt{delim} character is reached or \texttt{!in}, extract characters from \texttt{in} and append them to \texttt{s}, except that if an \texttt{escape} is reached, ignore it and append the next character to \texttt{s}.
   1.1.4 Discard the final \texttt{delim} character.
   1.1.5 Restore the \texttt{skipws} flag to its original value.
   1.1.6 Otherwise, \texttt{in $\gg$ s}.

   1.2 If \texttt{out} is an instance of \texttt{basic\_ostream} with member types \texttt{char\_type} and \texttt{traits\_type} the same as \texttt{charT} and \texttt{traits}, respectively, then the expression \texttt{out $\ll$ quoted(s, delim, escape)} behaves as specified for the \texttt{const basic\_string<charT, traits, Allocator>&} overload of the \texttt{quoted} function.

   1.3 The expression \texttt{in $\gg$ quoted(s, delim, escape)} has type \texttt{basic\_istream<charT, traits>&} and value \texttt{in}.
The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

29.8 String-based streams

29.8.1 Header `<sstream>` synopsis

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringbuf;

    using stringbuf = basic_stringbuf<char>;
    using wstringbuf = basic_stringbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_istringstream;
    using istringstream = basic_istringstream<char>;
    using wistringstream = basic_istringstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_ostringstream;
    using ostringstream = basic_ostringstream<char>;
    using wostringstream = basic_ostringstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringstream;
    using stringstream = basic_stringstream<char>;
    using wstringstream = basic_stringstream<wchar_t>;
}
```

The header `<sstream>` defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 21.3.

29.8.2 Class template `basic_stringbuf`

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringbuf : public basic_streambuf<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using allocator_type = Allocator;

            // 29.8.2.1, constructors
            basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {}
            explicit basic_stringbuf(ios_base::openmode which);
            explicit basic_stringbuf(
                const basic_string<charT, traits, Allocator>& s,
                ios_base::openmode which = ios_base::in | ios_base::out);
            explicit basic_stringbuf(const Allocator& a)
                : basic_stringbuf(ios_base::in | ios_base::out, a) {}
            basic_stringbuf(ios_base::openmode which, const Allocator& a);
            explicit basic_stringbuf(
                basic_string<charT, traits, Allocator>&& s,
                ios_base::openmode which = ios_base::in | ios_base::out);

§ 29.8.2 ©ISO/IEC 2020 – All rights reserved 1407
The class `basic_stringbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence can be initialized from, or made available as, an object of class `basic_string`.

For the sake of exposition, the maintained data and internal pointer initialization is presented here as:
— ios_base::openmode mode, has in set if the input sequence can be read, and out set if the output sequence can be written.

— basic_string<CharT, traits, Allocator> buf contains the underlying character sequence.

— init_buf_ptrs() sets the base class’ get area (29.6.3.3.2) and put area (29.6.3.3.3) pointers after initializing, moving from, or assigning to buf accordingly.

29.8.2.1 Constructors

explicit basic_stringbuf(ios_base::openmode which);
1
Effects: Initializes the base class with basic_streambuf() (29.6.3.1), and mode with which. It is implementation-defined whether the sequence pointers (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) are initialized to null pointers.

Postconditions: str().empty() is true.

explicit basic_stringbuf(
    const basic_string<CharT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
3
Effects: Initializes the base class with basic_streambuf() (29.6.3.1), mode with which, and buf with s, then calls init_buf_ptrs().

basic_stringbuf(ios_base::openmode which, const Allocator &a);
4
Effects: Initializes the base class with basic_streambuf() (29.6.3.1), mode with which, and buf with a, then calls init_buf_ptrs().

Postconditions: str().empty() is true.

explicit basic_stringbuf(
    basic_string<CharT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
6
Effects: Initializes the base class with basic_streambuf() (29.6.3.1), mode with which, and buf with std::move(s), then calls init_buf_ptrs().

template<class SAlloc>
basic_stringbuf(
    const basic_string<CharT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
7
Effects: Initializes the base class with basic_streambuf() (29.6.3.1), mode with which, and buf with {s, a}, then calls init_buf_ptrs().

template<class SAlloc>
explicit basic_stringbuf(
    const basic_string<CharT, traits, SAlloc>&& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
8
Constraints: is_same_v<SAlloc, Allocator> is false.

Effects: Initializes the base class with basic_streambuf() (29.6.3.1), mode with which, and buf with s, then calls init_buf_ptrs().

basic_stringbuf(basic_stringbuf&& rhs);

basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);

Effects: Copy constructs the base class from rhs and initializes mode with rhs.mode. In the first form buf is initialized from std::move(rhs).str(). In the second form buf is initialized from {std::move(rhs).str(), a}. It is implementation-defined whether the sequence pointers in *this (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) obtain the values which rhs had.

Postconditions: Let rhs_p refer to the state of rhs just prior to this construction and let rhs_a refer to the state of rhs just after this construction.

— str() == rhs_p.str()
— gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
— egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
---

29.8.2.2 Assignment and swap

basic_stringbuf& operator=(basic_stringbuf&& rhs);

Effects: After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 29.8.2.1).

Returns: *this.

void swap(basic_stringbuf& rhs) noexcept;

Preconditions: allocator_traits<Allocator>::propagate_on_container_swap::value is true or get_allocator() == s.get_allocator() is true.

Effects: Exchanges the state of *this and rhs.

Remarks: The expression inside noexcept is equivalent to:
allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value.

template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x, basic_stringbuf<charT, traits, Allocator>& y) noexcept(x.swap(y));

Effects: Equivalent to: x.swap(y).

29.8.2.3 Member functions

The member functions getting the underlying character sequence all refer to a high_mark value, where high_mark represents the position past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the basic_stringbuf passing a basic_string argument, or by calling one of the str member functions passing a basic_string as an argument. In the latter case, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new basic_string).

void init_buf_ptrs(); // exposition only

Effects: Initializes the input and output sequences from buf according to mode.

Postconditions:

(3.1)  
— If ios_base::out is set in mode, pbase() points to buf.front() and eptr() >= pbase() + buf.size() is true;
(3.1.1)  
— in addition, if ios_base::ate is set in mode, pptr() >= pbase() + buf.size() is true,
(3.1.2)  
— otherwise pptr() == pbase() is true.
(3.2)  
— If ios_base::in is set in mode, eback() points to buf.front(), and (gptr() == eback() && egptr() == eback() + buf.size()) is true.
(3.3)  
— ppstr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
(3.4)  
— epstr() - pbase() == rhs_p.eptr() - rhs_p.pbase()
(3.5)  
— if (eback()) eback() != rhs_a.eback()
(3.6)  
— if (gptr()) gptr() != rhs_a.gptr()
(3.7)  
— if (egptr()) egptr() != rhs_a.egptr()
(3.8)  
— if (pbase()) pbase() != rhs_a.pbase()
(3.9)  
— if (pptr()) pptr() != rhs_a.pptr()
(3.10)  
— if (epptr()) epptr() != rhs_a.epptr()
(3.11)  
— getloc() == rhs_p.getloc()
(3.12)  
— rhs is empty but usable, as if std::move(rhs).str() was called.

[Note: For efficiency reasons, stream buffer operations might violate invariants of buf while it is held encapsulated in the basic_stringbuf, e.g., by writing to characters in the range [buf.data() + buf.size(), buf.data() + buf.capacity()). All operations retrieving a basic_string from buf ensure that the basic_string invariants hold on the returned value. — end note]
allocator_type get_allocator() const noexcept;

Returns: buf.get_allocator().

basic_string<charT, traits, Allocator> str() const &;

Effects: Equivalent to:

return basic_string<charT, traits, Allocator>(view(), get_allocator());

template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;

Constraints: SAlloc is a type that qualifies as an allocator (22.2.1).

Effects: Equivalent to:

return basic_string<charT, traits, SAlloc>(view(), sa);

basic_string<charT, traits, Allocator> str() &&;

Returns: A basic_string<charT, traits, Allocator> object move constructed from the basic_stringbuf’s underlying character sequence in buf. This can be achieved by first adjusting buf to have the same content as view().

Postconditions: The underlying character sequence buf is empty and pbase(), pptr(), epptr(), eback(), gptr(), and egptr() are initialized as if by calling init_buf_ptrs() with an empty buf.

basic_string_view<charT, traits> view() const noexcept;

Let sv be basic_string_view<charT, traits>.

Returns: A sv object referring to the basic_stringbuf’s underlying character sequence in buf:

(12.1) If ios_base::out is set in mode, then sv(pbase(), high_mark-pbase()) is returned.

(12.2) Otherwise, if ios_base::in is set in mode, then sv(eback(), egptr()-eback()) is returned.

(12.3) Otherwise, sv() is returned.

[Note: Using the returned sv object after destruction or invalidation of the character sequence underlying *this is undefined behavior, unless sv.empty() is true. — end note]

void str(const basic_string<charT, traits, Allocator>& s);

Effects: Equivalent to:

buf = s;
init_buf_ptrs();

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);

Constraints: is_same_v<SAlloc,Allocator> is false.

Effects: Equivalent to:

buf = s;
init_buf_ptrs();

void str(basic_string<charT, traits, Allocator>&& s);

Effects: Equivalent to:

buf = std::move(s);
init_buf_ptrs();

29.8.2.4 Overridden virtual functions

int_type underflow() override;

Returns: If the input sequence has a read position available, returns traits::to_int_type(*gptr()). Otherwise, returns traits::eof(). Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

int_type pbackfail(int_type c = traits::eof()) override;

Effects: Puts back the character designated by c to the input sequence, if possible, in one of three ways:
(2.1) If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `traits::eq(to_char_type(c), gptr()[−1])` returns `true`, assigns `gptr() - 1` to `gptr()`.
Returns: `c`.

(2.2) If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `mode & ios_base::out` is nonzero, assigns `c` to `*--gptr()`.
Returns: `c`.

(2.3) If `traits::eq_int_type(c, traits::eof())` returns `true` and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.
Returns: `traits::not_eof(c)`.

Returns: As specified above, or `traits::eof()` to indicate failure.
Remarks: If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

```cpp
int_type overflow(int_type c = traits::eof()) override;
```
Effects: Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

(5.1) If `traits::eq_int_type(c, traits::eof())` returns `false` and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.
Signals success by returning `c`.

(5.2) If `traits::eq_int_type(c, traits::eof())` returns `true`, there is no character to append.
Signals success by returning a value other than `traits::eof()`.

Remarks: The function can alter the number of write positions available as a result of any call.
Returns: As specified above, or `traits::eof()` to indicate failure.

The function can make a write position available only if `ios_base::out` is set in `mode`. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If `ios_base::in` is set in `mode`, the function alters the read end pointer `egptr()` to point just past the new write position.

```cpp
pos_type seekoff(off_type off, ios_base::seekdir way,
    ios_base::openmode which = ios_base::in | ios_base::out) override;
```
Effects: Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 124.

Table 124: `seekoff` positioning

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ios_base::in</code> is set in which</td>
<td>positions the input sequence</td>
</tr>
<tr>
<td><code>ios_base::out</code> is set in which</td>
<td>positions the output sequence</td>
</tr>
<tr>
<td>both <code>ios_base::in</code> and <code>ios_base::out</code></td>
<td>positions both the input and the output sequences</td>
</tr>
<tr>
<td>are set in which and either way == <code>ios_base::beg</code> or way == <code>ios_base::end</code></td>
<td></td>
</tr>
<tr>
<td>Otherwise</td>
<td>the positioning operation fails.</td>
</tr>
</tbody>
</table>

For a sequence to be positioned, the function determines `newoff` as indicated in Table 125. If the sequence’s next pointer (either `gptr()` or `pptr()`) is a null pointer and `newoff` is nonzero, the positioning operation fails.

If `(newoff + off) < 0`, or if `newoff + off` refers to an uninitialized character (29.8.2.3), the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.  

§ 29.8.2.4 ©ISO/IEC 2020 – All rights reserved 1412
Table 125: newoff values

<table>
<thead>
<tr>
<th>Condition</th>
<th>newoff Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>way == ios_base::beg</td>
<td>0</td>
</tr>
<tr>
<td>way == ios_base::cur</td>
<td>the next pointer minus the beginning pointer (xnext - xbeg).</td>
</tr>
<tr>
<td>way == ios_base::end</td>
<td>the high mark pointer minus the beginning pointer (high_mark - xbeg).</td>
</tr>
</tbody>
</table>

Returns: pos_type(newoff), constructed from the resultant offset newoff (of type off_type), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is pos_type(off_type(-1)).

pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;

Effects: Equivalent to seekoff(off_type(sp), ios_base::beg, which).

Returns: sp to indicate success, or pos_type(off_type(-1)) to indicate failure.

basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n);

Effects: implementation-defined, except that setbuf(0, 0) has no effect.

Returns: this.

29.8.3 Class template basic_istringstream

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_istringstream : public basic_istream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using allocator_type = Allocator;

            // 29.8.3.1, constructors
            basic_istringstream() : basic_istringstream(ios_base::in) {};
            explicit basic_istringstream(ios_base::openmode which);
            explicit basic_istringstream(
                const basic_string<charT, traits, Allocator>& s,
                ios_base::openmode which = ios_base::in);
            basic_istringstream(ios_base::openmode which, const Allocator& a);
            explicit basic_istringstream(
                basic_string<charT, traits, Allocator>&& s,
                ios_base::openmode which = ios_base::in);
            template<class SAlloc>
                basic_istringstream(
                    const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
                    : basic_istringstream(s, ios_base::in, a) {};
            template<class SAlloc>
                basic_istringstream(
                    const basic_string<charT, traits, SAlloc>& s,
                    ios_base::openmode which, const Allocator& a);
            template<class SAlloc>
                explicit basic_istringstream(
                    const basic_string<charT, traits, SAlloc>& s,
                    ios_base::openmode which = ios_base::in);
The class `basic_istringstream<charT, traits, Allocator>` supports reading objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

— `sb`, the `stringbuf` object.

### 29.8.3.1 Constructors

**explicit basic_istringstream(ios_base::openmode which);**

1. **Effects:** Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (29.7.4.1) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in)` (29.8.2.1).

**explicit basic_istringstream(****

- `const basic_string<charT, traits, Allocator>& s`,
- `ios_base::openmode which = ios_base::in`;

2. **Effects:** Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (29.7.4.1) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in)` (29.8.2.1).

`basic_istringstream(ios_base::openmode which, const Allocator& a);`

3. **Effects:** Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (29.7.4.1) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in, a)` (29.8.2.1).

`explicit basic_istringstream(****

- `basic_string<charT, traits, Allocator>&& s`,
- `ios_base::openmode which = ios_base::in`;

4. **Effects:** Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (29.7.4.1) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::in)` (29.8.2.1).

`template<class SAlloc>

- `basic_istringstream(****

- `const basic_string<charT, traits, SAlloc>& s`,
- `SAlloc a`,
ios_base::openmode which, const Allocator& a);

Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.1) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in, a) (29.8.2.1).

template<class SAlloc>
explicit basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in);

Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.1) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in) (29.8.2.1).

basic_istringstream(basic_istringstream&& rhs);

Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained basic_stringbuf. Then calls basic_istream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_stringbuf.

29.8.3.2 Assignment and swap

void swap(basic_istringstream& rhs);

Effects: Equivalent to:
    basic_istream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x,
    basic_istringstream<charT, traits, Allocator>& y);

Effects: Equivalent to: x.swap(y).

29.8.3.3 Member functions

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).

basic_string<charT, traits, Allocator> str() const &;

Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;

Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<charT,traits,Allocator> str() &&;

Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<charT, traits> view() const noexcept;

Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<charT, traits, Allocator>& s);

Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);

Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<charT, traits, Allocator>&& s);

Effects: Equivalent to: rdbuf()->str(std::move(s));
29.8.4 Class template `basic_ostringstream` [sstream]

namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_ostringstream : public basic_ostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using allocator_type = Allocator;

        // 29.8.4.1, constructors
        basic_ostringstream() : basic_ostringstream(ios_base::out) {}  
        explicit basic_ostringstream(ios_base::openmode which);
        explicit basic_ostringstream(
            const basic_string<charT, traits, Allocator>& s,
            ios_base::openmode which = ios_base::out);
        basic_ostringstream(ios_base::openmode which, const Allocator& a);
        explicit basic_ostringstream(
            basic_string<charT, traits, Allocator>&& s,
            ios_base::openmode which = ios_base::out);
        template<class SAlloc>
        basic_ostringstream(
            const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
            : basic_ostringstream(s, ios_base::out, a) {}  
        template<class SAlloc>
        basic_ostringstream(
            const basic_string<charT, traits, SAlloc>& s,
            ios_base::openmode which, const Allocator& a);
        template<class SAlloc>
        basic_ostringstream(  
            const basic_string<charT, traits, SAlloc>& s,
            ios_base::openmode which = ios_base::out);
        basic_ostringstream(const basic_ostringstream&) = delete;
        basic_ostringstream(basic_ostringstream&& rhs);

        // 29.8.4.2, assign and swap
        basic_ostringstream& operator=(const basic_ostringstream&) = delete;
        basic_ostringstream& operator=(basic_ostringstream&& rhs);
        void swap(basic_ostringstream& rhs);

        // 29.8.4.3, members
        basic_stringbuf<charT, traits, Allocator>& rdbuf() const;
        basic_string<charT, traits, Allocator> str() const &;
        template<class SAlloc>
        basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
        basic_string<charT, traits, Allocator> str() &&;
        basic_string_view<charT, traits> view() const noexcept;
        void str(const basic_string<charT, traits, Allocator>& s);
        template<class SAlloc>
        void str(const basic_string<charT, traits, SAlloc>& s);
        void str(basic_string<charT, traits, Allocator>&& s);

        private:
            basic_stringbuf<charT, traits, Allocator> sb;  // exposition only
    };
}
The class `basic_ostringstream<charT, traits, Allocator>` supports writing objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

\[ (1.1) \quad \text{sb}, \text{ the stringbuf object.} \]

### 29.8.4.1 Constructors

```cpp
explicit basic_ostringstream(ios_base::openmode which);
```

**Effects:** Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.1) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out)` (29.8.2.1).

```cpp
explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out);
```

**Effects:** Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.1) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (29.8.2.1).

```cpp
basic_ostringstream(ios_base::openmode which, const Allocator& a);
```

**Effects:** Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.1) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out, a)` (29.8.2.1).

```cpp
explicit basic_ostringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out);
```

**Effects:** Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.1) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::out)` (29.8.2.1).

```cpp
template<class SAlloc>
explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
```

**Effects:** Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.1) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out, a)` (29.8.2.1).

```cpp
template<class SAlloc>
explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>&& s,
    ios_base::openmode which = ios_base::out);
```

**Constraints:** `is_same_v<SAlloc, Allocator>` is false.

**Effects:** Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (29.7.5.1) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (29.8.2.1).

```cpp
basic_ostringstream(basic_ostringstream&& rhs);
```

**Effects:** Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.
29.8.4.2 Assignment and swap

void swap(basic_ostream& rhs);

Effects: Equivalent to:

basic_ostream<
charT, traits>::swap(rhs);
sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_ostream<
charT, traits, Allocator>& x,
basic_ostream<
charT, traits, Allocator>& y);

Effects: Equivalent to: x.swap(y).

29.8.4.3 Member functions

basic_stringbuf<
charT, traits, Allocator>* rdbuf() const;

Returns: const_cast<
basic_stringbuf<
charT, traits, Allocator>* >(addressof(sb)).

basic_string<
charT, traits, Allocator> str() const &;

Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<
charT, traits, SAlloc> str(const SAlloc& sa) const;

Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<
charT, traits> view() const noexcept;

Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<
charT, traits, Allocator>& s);

Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<
charT, traits, SAlloc>& s);

Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<
charT, traits, Allocator>&& s);

Effects: Equivalent to: rdbuf()->str(std::move(s));

29.8.5 Class template basic_stringstream

namespace std {

template<class charT, class traits = char_traits<charT>,
class Allocator = allocator<charT>>
class basic_stringstream : public basic_iostream<
charT, traits> {

public:

using char_type = charT;
using int_type = typename traits::int_type;
using pos_type = typename traits::pos_type;
using off_type = typename traits::off_type;
using traits_type = traits;
using allocator_type = Allocator;

// 29.8.5.1, constructors

basic_stringstream() : basic_stringstream(ios_base::out | ios_base::in) {} 
explicit basic_stringstream(ios_base::openmode which);
explicit basic_stringstream(
    const basic_string<
charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);

basic_stringstream(ios_base::openmode which, const Allocator& a);
explicit basic_stringstream(  
    basic_string<charT, traits, Allocator>&& s,  
    ios_base::openmode which = ios_base::out | ios_base::in);  

template<class SAlloc>  
basic_stringstream(  
    const basic_string<charT, traits, SAlloc>&& s, const Allocator& a)  
: basic_stringstream(s, ios_base::out | ios_base::in, a) {}  

template<class SAlloc>  
explicit basic_stringstream(  
    const basic_string<charT, traits, SAlloc>& s,  
    ios_base::openmode which, const Allocator& a);  

template<class SAlloc>  
basic_stringstream(  
    const basic_string<charT, traits, SAlloc>& s,  
    ios_base::openmode which = ios_base::out | ios_base::in);  
asic_stringstream(const basic_stringstream&) = delete;  

basic_stringstream(basic_stringstream&& rhs);  

// 29.8.5.2, assign and swap  

basic_stringstream& operator=(const basic_stringstream&) = delete;  

basic_stringstream& operator=(basic_stringstream&& rhs);  

void swap(basic_stringstream& rhs);  

// 29.8.5.3, members  

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;  

basic_string<charT, traits, Allocator> str() const &;  

template<class SAlloc>  
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;  

basic_string<charT, traits, Allocator> str() &&;  

basic_string_view<charT, traits> view() const noexcept;  

void str(const basic_string<charT, traits, Allocator>& s);  

template<class SAlloc>  
void str(const basic_string<charT, traits, SAlloc>& s);  

void str(basic_string<charT, traits, Allocator>&& s);  

private:  
    basic_stringbuf<charT, traits> sb; // exposition only  
};  

template<class charT, class traits, class Allocator>  
void swap(basic_stringstream<charT, traits, Allocator>& x,  
    basic_stringstream<charT, traits, Allocator>& y);  

1 The class template basic_stringstream<charT, traits> supports reading and writing from objects of class basic_string<charT, traits, Allocator>. It uses a basic_stringbuf<charT, traits, Allocator> object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

(1.1) — sb, the stringbuf object.

29.8.5.1 Constructors

explicit basic_stringstream(ios_base::openmode which);  

1 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.6.1) and sb with basic_stringbuf<charT, traits, Allocator>(which).

explicit basic_stringstream(  
    const basic_string<charT, traits, Allocator>&& s,  
    ios_base::openmode which = ios_base::out | ios_base::in);  

2 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.6.1) and sb with basic_stringbuf<charT, traits, Allocator>(s, which).
basic_stringstream(ios_base::openmode which, const Allocator& a);

    Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (29.7.4.6.1) and sb with basic_stringbuf<charT, traits, Allocator>(which, a) (29.8.2.1).

extric basic_stringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out | ios_base::in);

    Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (29.7.4.6.1) and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which) (29.8.2.1).

template<class SAlloc>
basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);

    Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (29.7.4.6.1) and sb with basic_stringbuf<charT, traits, Allocator>(s, which, a) (29.8.2.1).

template<class SAlloc>
explicit basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);

    Constraints: is_same_v<SAlloc,Allocator> is false.

    Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (29.7.4.6.1) and sb with basic_stringbuf<charT, traits, Allocator>(s, which) (29.8.2.1).

basic_stringstream(basic_stringstream&& rhs);

    Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained basic_stringbuf. Then calls basic_istream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_stringbuf.

29.8.5.2 Assignment and swap [stringstream.assign]

void swap(basic_stringstream& rhs);

    Effects: Equivalent to:
    basic_iostream<charT,traits>::swap(rhs);
    sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
    basic_stringstream<charT, traits, Allocator>& y);

    Effects: Equivalent to: x.swap(y).

29.8.5.3 Member functions [stringstream.members]

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

    Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).

basic_string<charT, traits, Allocator> str() const &;

    Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;

    Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<charT, traits, Allocator> str() &&;

    Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<charT, traits> view() const noexcept;

    Effects: Equivalent to: return rdbuf()->view();
void str(const basic_string<charT, traits, Allocator>& s);

Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);

Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<charT, traits, Allocator>&& s);

Effects: Equivalent to: rdbuf()->str(std::move(s));

29.9 File-based streams

29.9.1 Header <fstream> synopsis

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf;
    using filebuf = basic_filebuf<char>;
    using wfilebuf = basic_filebuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_ifstream;
    using ifstream = basic_ifstream<char>;
    using wifstream = basic_ifstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_ofstream;
    using ofstream = basic_ofstream<char>;
    using wofstream = basic_ofstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_fstream;
    using fstream = basic_fstream<char>;
    using wfstream = basic_fstream<wchar_t>;
}

1 The header <fstream> defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.

2 [Note: The class template basic_filebuf treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the basic_filebuf object converts those multibyte sequences into wide character sequences. —end note]

3 In subclause 29.9, member functions taking arguments of const filesystem::path::value_type* are only be provided on systems where filesystem::path::value_type (29.11.7) is not char. [Note: These functions enable class path support for systems with a wide native path character type, such as wchar_t. —end note]
The class `basic_filebuf<charT, traits>` associates both the input sequence and the output sequence with a file. The restrictions on reading and writing a sequence controlled by an object of class `basic_filebuf<charT, traits>` are the same as for reading and writing with the C standard library `FILE`s. In particular:

1. If the file is not open for reading the input sequence cannot be read.
2. If the file is not open for writing the output sequence cannot be written.
3. A joint file position is maintained for both the input sequence and the output sequence.

An instance of `basic_filebuf` behaves as described in §29.9.2 provided `traits::pos_type` is `fpos<typename traits::state_type>`. Otherwise the behavior is undefined.

In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as a `_codecvt` in following subclauses, obtained as if by

```cpp
const _codecvt<charT, char, typename traits::state_type>& a_codecvt = use_facet<_codecvt<charT, char, typename traits::state_type>>(getloc());
```

### 29.9.2.1 Constructors

**basic_filebuf();**

**Effects:** Initializes the base class with `basic_streambuf<charT, traits>()` (29.6.3.1).
Postconditions: is_open() == false.

basic_filebuf(basic_filebuf&& rhs);

Effects: It is implementation-defined whether the sequence pointers in *this (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) obtain the values which rhs had. Whether they do or not, *this and rhs reference separate buffers (if any at all) after the construction. Additionally *this references the file which rhs did before the construction, and rhs references no file after the construction. The openmode, locale and any other state of rhs is also copied.

Postconditions: Let rhs_p refer to the state of rhs just prior to this construction and let rhs_a refer to the state of rhs just after this construction.

(4.1) — is_open() == rhs_p.is_open()
(4.2) — rhs_a.is_open() == false
(4.3) — gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
(4.4) — egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
(4.5) — pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
(4.6) — epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()
(4.7) — if (eback()) eback() != rhs_a.eback()
(4.8) — if (gptr()) gptr() != rhs_a.gptr()
(4.9) — if (egptr()) egptr() != rhs_a.egptr()
(4.10) — if (pbase()) pbase() != rhs_a.pbase()
(4.11) — if (pptr()) pptr() != rhs_a.pptr()
(4.12) — if (epptr()) epptr() != rhs_a.epptr()

virtual ~basic_filebuf();

Effects: Calls close(). If an exception occurs during the destruction of the object, including the call to close(), the exception is caught but not rethrown (see 16.5.5.13).

Assignment and swap [filebuf.assign]

basic_filebuf& operator=(basic_filebuf&& rhs);

Effects: Calls close() then move assigns from rhs. After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 29.9.2.1).

Returns: *this.

void swap(basic_filebuf& rhs);

Effects: Exchanges the state of *this and rhs.

template<class charT, class traits>
void swap(basic_filebuf<charT, traits>& x,
          basic_filebuf<charT, traits>& y);

Effects: Equivalent to: x.swap(y).

Member functions [filebuf.members]

bool is_open() const;

Returns: true if a previous call to open succeeded (returned a non-null value) and there has been no intervening call to close.

basic_filebuf* open(const char* s, ios_base::openmode mode);

basic_filebuf* open(const filesystem::path::value_type* s,
                     ios_base::openmode mode); // wide systems only; see 29.9.1

Preconditions: s points to a NTCTS (16.3.18).

Effects: If is_open() ! = false, returns a null pointer. Otherwise, initializes the filebuf as required. It then opens the file to which s resolves, if possible, as if by a call to fopen with the second argument

§ 29.9.2.3 ©ISO/IEC 2020 – All rights reserved 1423
determined from `mode & ~ios_base::ate` as indicated in Table 126. If `mode` is not some combination of flags shown in the table then the open fails.

Table 126: File open modes

<table>
<thead>
<tr>
<th>ios_base flag combination</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>

<td>&quot;a+b&quot;</td>
</tr>
</tbody>
</table>

4 If the open operation succeeds and `ios_base::ate` is set in `mode`, positions the file to the end (as if by calling `fseek(file, 0, SEEK_END)`, where `file` is the pointer returned by calling `fopen`).

5 If the repositioning operation fails, calls `close()` and returns a null pointer to indicate failure.

6 Returns: this if successful, a null pointer otherwise.

    basic_filebuf* open(const string& s, ios_base::openmode mode);
    basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);

7 Returns: `open(s.c_str(), mode);`

8 Effects: If `is_open() == false`, returns a null pointer. If a put area exists, calls `overflow(traits::eof())` to flush characters. If the last virtual member function called on `*this` (between `underflow`, `overflow`, `seekoff`, and `seekpos`) was `overflow` then calls `a_codecvt.unshift` (possibly several times) to determine a termination sequence, inserts those characters and calls `overflow(traits::eof())` again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling `fclose(file)`). If any of the calls made by the function, including `fclose`, fails, `close` fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

9 Returns: this on success, a null pointer otherwise.

10 Postconditions: `is_open() == false`.

### 29.9.2.4 Overridden virtual functions

**streamsize showmanyc() override**;

1 Effects: Behaves the same as `basic_streambuf::showmanyc()` (29.6.3.4).

2 Remarks: An implementation might well provide an overriding definition for this function signature if it can determine that more characters can be read from the input sequence.

---

323) The macro `SEEK_END` is defined, and the function signatures `fopen(const char*, const char*)` and `fseek(FILE*, long, int)` are declared, in `<cstdio>` (29.12.1).
int_type underflow() override;

Effects: Behaves according to the description of basic_streambuf<charT, traits>::underflow(), with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer (extern_buf) and then as if by doing:

```c
char extern_buf[XSIZE];
char* extern_end;
charT intern_buf[ISIZE];
charT* intern_end;
codecvt_base::result r =
    a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
               intern_buf, intern_buf+ISIZE, intern_end);
```

This shall be done in such a way that the class can recover the position (fpos_t) corresponding to each character between intern_buf and intern_end. If the value of r indicates that a_codecvt.in() ran out of space in intern_buf, retry with a larger intern_buf.

int_type uflow() override;

Effects: Behaves according to the description of basic_streambuf<charT, traits>::uflow(), with the specialization that a sequence of characters is read from the input with the same method as used by underflow.

int_type pbackfail(int_type c = traits::eof()) override;

Effects: Puts back the character designated by c to the input sequence, if possible, in one of three ways:

(5.1) If traits::eq_int_type(c, traits::eof()) returns false and if the function makes a putback position available and if traits::eq(to_char_type(c), gptr()[-1]) returns true, decrements the next pointer for the input sequence, gptr().

Returns: c.

(5.2) If traits::eq_int_type(c, traits::eof()) returns false and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores c there.

Returns: c.

(5.3) If traits::eq_int_type(c, traits::eof()) returns true, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, gptr().

Returns: traits::not_eof(c).

Returns: As specified above, or traits::eof() to indicate failure.

Remarks: If is_open() == false, the function always fails.

The function does not put back a character directly to the input sequence.

If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

int_type overflow(int_type c = traits::eof()) override;

Effects: Behaves according to the description of basic_streambuf<charT, traits>::overflow(c), except that the behavior of “consuming characters” is performed by first converting as if by:

```c
charT b = pbase();
charT p = pptr();
charT* end;
char xbuf[XSIZE];
char* xbuf_end;
codecvt_base::result r =
    a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);
```

and then

(10.1) If r == codecvt_base::error then fail.

(10.2) If r == codecvt_base::noconv then output characters from b up to (and not including) p.
(10.3) If \( r == \text{codecvt\_base::partial} \) then output to the file characters from \( \text{xbuf} \) up to \( \text{xbuf\_end} \), and repeat using characters from \( \text{end} \) to \( \text{p} \). If output fails, fail (without repeating).

(10.4) Otherwise output from \( \text{xbuf} \) to \( \text{xbuf\_end} \), and fail if output fails. At this point if \( b != \text{p} \) and \( b == \text{end} \) (\( \text{xbuf} \) isn’t large enough) then increase \( \text{XSIZE} \) and repeat from the beginning.

Returns: \( \text{traits::not\_eof(c)} \) to indicate success, and \( \text{traits::eof()} \) to indicate failure. If \( \text{is\_-open()} == \text{false} \), the function always fails.

\[
\text{basic\_streambuf\_s setbuf(char\_type* s, streamsize n) override;}$

Effects: If \( \text{setbuf(0, 0)} \) is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. “Unbuffered” means that \( \text{pbase()} \) and \( \text{pptr()} \) always return null and output to the file should appear as soon as possible.

\[
\text{pos\_type seekoff(off\_type off, ios\_base::seekdir way,}
\begin{align*}
\quad & \text{ios\_base::openmode which} \\
\quad & \quad = \text{ios\_base::in | ios\_base::out} \text{ override;}$
\]

Effects: Let \( \text{width} \) denote \( \text{a\_codecvt\_encoding()}. \) If \( \text{is\_open()} == \text{false}, \) or \( \text{off} != 0 \) \&\& \( \text{width} \leq 0 \), then the positioning operation fails. Otherwise, if \( \text{way} != \text{basic\_ios::cur} \) or \( \text{off} != 0 \), and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if \( \text{width} > 0 \), call \( \text{fseek(file, width * off, whence)} \), otherwise call \( \text{fseek(file, 0, whence)} \).

Remarks: “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if \( \text{width} \) is less than zero then call \( \text{a\_codecvt\_unshift(state, xbuf, xbuf\_end, XSIZE, xbuf\_end)} \) and output the resulting unshift sequence. The function determines one of three values for the argument \( \text{ whence} \), of type \( \text{int} \), as indicated in Table 127.

<table>
<thead>
<tr>
<th>way</th>
<th>stdio Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic_ios_beg</td>
<td>SEEK_SET</td>
</tr>
<tr>
<td>basic_ios_cur</td>
<td>SEEK_CUR</td>
</tr>
<tr>
<td>basic_ios_end</td>
<td>SEEK_END</td>
</tr>
</tbody>
</table>

Returns: A newly constructed \( \text{pos\_type} \) object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns \( \text{pos\_type(off\_type(-1))} \).

\[
\text{pos\_type seekpos(pos\_type sp,}
\begin{align*}
\quad & \text{ios\_base::openmode which} \\
\quad & \quad = \text{ios\_base::in | ios\_base::out} \text{ override;}$
\]

Alters the file position, if possible, to correspond to the position stored in \( \text{sp} \) (as described below). Altering the file position performs as follows:

1. if \( \text{(om & ios\_base::out)} != 0 \), then update the output sequence and write any unshift sequence;
2. set the file position to \( \text{sp} \) as if by a call to \( \text{fsetpos} \);
3. if \( \text{(om & ios\_base::in)} != 0 \), then update the input sequence;

where \( \text{om} \) is the open mode passed to the last call to \( \text{open()} \). The operation fails if \( \text{is\_open()} \) returns \( \text{false} \).

If \( \text{sp} \) is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If \( \text{sp} \) has not been obtained by a previous successful call to one of the positioning functions \( \text{seekoff or seekpos} \) on the same file the effects are undefined.

Returns: \( \text{sp} \) on success. Otherwise returns \( \text{pos\_type(off\_type(-1))} \).

\[
\text{int sync() override;}
\]

Effects: If a put area exists, calls \( \text{filebuf::overflow} \) to write the characters to the file, then flushes the file as if by calling \( \text{fflush(file)} \). If a get area exists, the effect is implementation-defined.
void imbue(const locale& loc) override;

20

Preconditions: If the file is not positioned at its beginning and the encoding of the current
locale as
determined by `a_codecvt.encoding()` is state-dependent (28.4.1.4.2) then that facet is the same as
the corresponding facet of `loc`.

21

Effects: Causes characters inserted or extracted after this call to be converted according to `loc` until
another call of `imbue`.

22

Remarks: This may require reconversion of previously converted characters. This in turn may require
the implementation to be able to reconstruct the original contents of the file.

29.9.3 Class template `basic_ifstream` [ifstream]

namespace std {

    template<class charT, class traits = char_traits<charT>>
    class basic_ifstream : public basic_istream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 29.9.3.1, constructors
            basic_ifstream();
            explicit basic_ifstream(const char* s,       // 29.9.3.2, assign and swap
                        ios_base::openmode mode = ios_base::in);
            explicit basic_ifstream(const filesystem::path::value_type* s,       // wide systems only; see 29.9.1
                        ios_base::openmode mode = ios_base::in);
            explicit basic_ifstream(const string& s,       // wide systems only; see 29.9.1
                        ios_base::openmode mode = ios_base::in);
            explicit basic_ifstream(const filesystem::path& s,      // wide systems only; see 29.9.1
                        ios_base::openmode mode = ios_base::in);
            basic_ifstream(const basic_ifstream&) = delete;
            basic_ifstream(basic_ifstream&& rhs);

            // 29.9.3.2, assign and swap
            basic_ifstream& operator=(const basic_ifstream&) = delete;
            basic_ifstream& operator=(basic_ifstream&& rhs);
            void swap(basic_ifstream& rhs);

            // 29.9.3.3, members
            basic_filebuf<charT, traits>* rdbuf() const;
            bool is_open() const;
            void open(const char* s, ios_base::openmode mode = ios_base::in);
            void open(const filesystem::path::value_type* s,            // wide systems only; see 29.9.1
                        ios_base::openmode mode = ios_base::in);
            void open(const string& s, ios_base::openmode mode = ios_base::in);
            void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
            void close();

            private:
                basic_filebuf<charT, traits> sb;  // exposition only
            
        
    };

template<class charT, class traits>
    void swap(basic_ifstream<charT, traits>& x,
                basic_ifstream<charT, traits>& y);
};

1 The class `basic_ifstream<charT, traits>` supports reading from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

1.1 — `sb`, the `filebuf` object.
29.9.3.1 Constructors

basic_ifstream();

Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.1.1) and sb with basic_filebuf<charT, traits>() (29.9.2.1).

explicit basic_ifstream(const char* s,
   ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path::value_type* s,
   ios_base::openmode mode = ios_base::in); // wide systems only; see 29.9.1

Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (29.7.4.1.1) and sb with basic_filebuf<charT, traits>() (29.9.2.1), then calls rdbuf()->open(s, mode | ios_base::in). If that function returns a null pointer, calls setstate(failbit).

explicit basic_ifstream(const string& s,
   ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path& s,
   ios_base::openmode mode = ios_base::in);

Effects: Equivalent to: basic_ifstream(s.c_str(), mode).

basic_ifstream(basic_ifstream&& rhs);

Effects: Move constructs the base class, and the contained basic_filebuf. Then calls basic_istream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_filebuf.

29.9.3.2 Assignment and swap

void swap(basic_ifstream& rhs);

Effects: Exchanges the state of *this and rhs by calling basic_istream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).

template<class charT, class traits>
  void swap(basic_ifstream<charT, traits>& x,
             basic_ifstream<charT, traits>& y);

Effects: Equivalent to: x.swap(y).

29.9.3.3 Member functions

basic_filebuf<charT, traits>* rdbuf() const;

Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

bool is_open() const;

Returns: rdbuf()->is_open().

void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s,
   ios_base::openmode mode = ios_base::in); // wide systems only; see 29.9.1

Effects: Calls rdbuf()->open(s, mode | ios_base::in). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (29.5.5.4).

void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);

Effects: Calls open(s.c_str(), mode).

void close();

Effects: Calls rdbuf()->close() and, if that function returns a null pointer, calls setstate(failbit) (which may throw ios_base::failure) (29.5.5.4).
29.9.4 Class template basic_ofstream

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ofstream : public basic_ostream<charT, traits> {
      public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 29.9.4.1, constructors
        basic_ofstream();
        explicit basic_ofstream(const char* s,
                                 ios_base::openmode mode = ios_base::out);
        explicit basic_ofstream(const filesystem::path::value_type* s,
                                 // wide systems only; see 29.9.1
                                 ios_base::openmode mode = ios_base::out);
        explicit basic_ofstream(const string& s,
                                 ios_base::openmode mode = ios_base::out);
        explicit basic_ofstream(const filesystem::path& s,
                                 ios_base::openmode mode = ios_base::out);
        basic_ofstream(const basic_ofstream&) = delete;
        basic_ofstream(basic_ofstream&& rhs);

        // 29.9.4.2, assign and swap
        basic_ofstream& operator=(const basic_ofstream&) = delete;
        basic_ofstream& operator=(basic_ofstream&& rhs);
        void swap(basic_ofstream& rhs);

        // 29.9.4.3, members
        basic_filebuf<charT, traits>* rdbuf() const;
        bool is_open() const;
        void open(const char* s, ios_base::openmode mode = ios_base::out);
        void open(const filesystem::path::value_type* s,
                  // wide systems only; see 29.9.1
                  ios_base::openmode mode = ios_base::out);
        void open(const string& s, ios_base::openmode mode = ios_base::out);
        void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
        void close();
      private:
        basic_filebuf<charT, traits> sb; // exposition only
      }
    }

    template<class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x,
              basic_ofstream<charT, traits>& y);
}

The class basic_ofstream<charT, traits> supports writing to named files. It uses a basic_filebuf<charT, traits> object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

— sb, the filebuf object.

29.9.4.1 Constructors

basic_ofstream();

Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (29.7.5.1.1) and sb with basic_filebuf<charT, traits>{} (29.9.2.1).
explicit basic_ofstream(const filesystem::path::value_type* s, 
    ios_base::openmode mode = ios_base::out); // wide systems only; see 29.9.1

2 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (29.7.5.1.1) and sb with basic_filebuf<charT, traits>() (29.9.2.1), then calls rdbuf()->open(s, mode | ios_base::out). If that function returns a null pointer, calls setstate(failbit).

explicit basic_ofstream(const string& s, 
    ios_base::openmode mode = ios_base::out);

explicit basic_ofstream(const filesystem::path& s, 
    ios_base::openmode mode = ios_base::out);

3 Effects: Equivalent to: basic_ofstream(s.c_str(), mode).

basic_ofstream(basic_ofstream&& rhs);

4 Effects: Move constructs the base class, and the contained basic_filebuf. Then calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_filebuf.

29.9.4.2 Assignment and swap

void swap(basic_ofstream& rhs);

1 Effects: Exchanges the state of *this and rhs by calling basic_ostream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).

template<class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x, 
              basic_ofstream<charT, traits>& y);

2 Effects: Equivalent to: x.swap(y).

29.9.4.3 Member functions

basic_filebuf<charT, traits>* rdbuf() const;

1 Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

bool is_open() const;

2 Returns: rdbuf()->is_open().

void open(const char* s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path::value_type* s, 
    ios_base::openmode mode = ios_base::out); // wide systems only; see 29.9.1

3 Effects: Calls rdbuf()->open(s, mode | ios_base::out). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (29.5.5.4).

void close();

4 Effects: Calls rdbuf()->close() and, if that function fails (returns a null pointer), calls setstate(failbit) (which may throw ios_base::failure) (29.5.5.4).

void open(const string& s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);

5 Effects: Calls open(s.c_str(), mode).

29.9.5 Class template basic_fstream

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_fstream : public basic_iostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

§ 29.5 ©ISO/IEC 2020 – All rights reserved 1430
The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

\[ \text{sb, the basic_filebuf object.} \]  

### 29.9.5.1 Constructors

```cpp
basic_fstream();

Effects: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb)) (29.7.4.6.1)` and `sb` with `basic_filebuf<charT, traits>()`.  

explicit basic_fstream(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
```
explicit basic_fstream(
    const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 29.9.1

Effects: Initializes the base class with basic_iostream<
    charT, traits>(addressof(sb)) (29.7.4.6.1) and sb with basic_filebuf<
    charT, traits>(). Then calls rdbuf()->open(s, mode). If that function
returns a null pointer, calls setstate(failbit).

explicit basic_fstream(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);

explicit basic_fstream(
    const filesystem::path& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);

Effects: Equivalent to: basic_fstream(s.c_str(), mode).

basic_fstream(basic_fstream&& rhs);

Effects: Move constructs the base class, and the contained basic_filebuf. Then calls basic_istream<charT, traits>::
set_rdbuf(addressof(sb)) to install the contained basic_filebuf.

29.9.5.2 Assignment and swap

void swap(basic_fstream& rhs);

Effects: Exchanges the state of *this and rhs by calling basic_istream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).

template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x,
    basic_fstream<charT, traits>& y);

Effects: Equivalent to: x.swap(y).

29.9.5.3 Member functions

basic_filebuf<charT, traits>* rdbuf() const;

Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

bool is_open() const;

Returns: rdbuf()->is_open().

void open(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);

void open(
    const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 29.9.1

Effects: Calls rdbuf()->open(s, mode). If that function does not return a null pointer calls clear(),
otherwise calls setstate(failbit) (which may throw ios_base::failure) (29.5.5.4).

void open(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);

void open(
    const filesystem::path& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);

Effects: Calls open(s.c_str(), mode).

void close();

Effects: Calls rdbuf()->close() and, if that function returns a null pointer, calls setstate(failbit) (which may throw ios_base::failure) (29.5.5.4).
29.10 Synchronized output streams

29.10.1 Header <syncstream> synopsis

```c++
#include <ostream> // see 29.7.2

namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
        class basic_syncbuf;

    using syncbuf = basic_syncbuf<char>;
    using wsyncbuf = basic_syncbuf<wchar_t>;

template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_osyncstream;

    using osyncstream = basic_osyncstream<char>;
    using wosyncstream = basic_osyncstream<wchar_t>;
}
```

The header <syncstream> provides a mechanism to synchronize execution agents writing to the same stream.

29.10.2 Class template basic_syncbuf

29.10.2.1 Overview

```c++
namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
        class basic_syncbuf : public basic_streambuf<charT, traits> {
            public:
                using char_type = charT;
                using int_type = typename traits::int_type;
                using pos_type = typename traits::pos_type;
                using off_type = typename traits::off_type;
                using traits_type = traits;
                using allocator_type = Allocator;
                using streambuf_type = basic_streambuf<charT, traits>;

            // 29.10.2.2, construction and destruction
            basic_syncbuf() : basic_syncbuf(nullptr) {} 
            explicit basic_syncbuf(streambuf_type* obuf) : basic_syncbuf(obuf, Allocator()) {} 
            basic_syncbuf(streambuf_type*, const Allocator&);
            basic_syncbuf(basic_syncbuf&&);
            ~basic_syncbuf();

            // 29.10.2.3, assignment and swap
            basic_syncbuf& operator=(basic_syncbuf&&);
            void swap(basic_syncbuf&);

            // 29.10.2.4, member functions
            bool emit();
            streambuf_type* get_wrapped() const noexcept;
            allocator_type get_allocator() const noexcept;
            void set_emit_on_sync(bool) noexcept;

            protected:
                // 29.10.2.5, overridden virtual functions
                int sync() override;

            private:
                streambuf_type* wrapped; // exposition only
                bool emit_on_sync{}; // exposition only
                }
```

§ 29.10.2.1 ©ISO/IEC 2020 – All rights reserved 1433
Class template `basic_syncbuf` stores character data written to it, known as the associated output, into internal buffers allocated using the object’s allocator. The associated output is transferred to the wrapped stream buffer object `*wrapped` when `emit()` is called or when the `basic_syncbuf` object is destroyed. Such transfers are atomic with respect to transfers by other `basic_syncbuf` objects with the same wrapped stream buffer object.

### 29.10.2.2 Construction and destruction

```cpp
basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);
```

1. Effects: Sets `wrapped` to `obuf`.
2. Remarks: A copy of `allocator` is used to allocate memory for internal buffers holding the associated output.
3. Throws: Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.
4. Postconditions: `get_wrapped() == obuf` and `get_allocator() == allocator` are true.

```cpp
basic_syncbuf(basic_syncbuf&& other);
```

5. Postconditions: The value returned by `this->get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. Output stored in `other` prior to calling this constructor will be stored in `*this` afterwards. `other.rdbuf()->pbase() == other.rdbuf()->pptr()` and `other.get_wrapped() == nullptr` are true.
6. Remarks: This constructor disassociates `other` from its wrapped stream buffer, ensuring destruction of `other` produces no output.

```cpp
~basic_syncbuf();
```

7. Effects: Calls `emit()`.
8. Throws: Nothing. If an exception is thrown from `emit()`, the destructor catches and ignores that exception.

### 29.10.2.3 Assignment and swap

```cpp
basic_syncbuf& operator=(basic_syncbuf&& rhs) noexcept;
```

1. Effects: Calls `emit()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (29.10.2.2).
2. Returns: `*this`.
3. Postconditions:
   - `rhs.get_wrapped() == nullptr` is true.
   - `this->get_allocator() == rhs.get_allocator()` is true when
     ```cpp
     allocator_traits<Allocator>::propagate_on_container_move_assignment::value
     ```
     is true; otherwise, the allocator is unchanged.
4. Remarks: This assignment operator disassociates `rhs` from its wrapped stream buffer, ensuring destruction of `rhs` produces no output.

```cpp
void swap(basic_syncbuf& other) noexcept;
```

5. Preconditions: Either `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `this->get_allocator() == other.get_allocator()` is true.
6. Effects: Exchanges the state of `*this` and `other`.

§ 29.10.2.3 ©ISO/IEC 2020 – All rights reserved 1434
29.10.2.4 Member functions

```cpp
bool emit();
```

**Effects:** Atomically transfers the associated output of `*this` to the stream buffer `*wrapped`, so that it appears in the output stream as a contiguous sequence of characters. `wrapped->pubsync()` is called if and only if a call was made to `sync()` since the most recent call to `emit()`, if any.

**Returns:** `true` if all of the following conditions hold; otherwise `false`:

1. `wrapped` is `nullptr`.
2. All of the characters in the associated output were successfully transferred.
3. The call to `wrapped->pubsync()` (if any) succeeded.

**Postconditions:** On success, the associated output is empty.

**Synchronization:** All `emit()` calls transferring characters to the same stream buffer object appear to execute in a total order consistent with the “happens before” relation (6.9.2.1), where each `emit()` call synchronizes with subsequent `emit()` calls in that total order.

**Remarks:** May call member functions of `wrapped` while holding a lock uniquely associated with `wrapped`.

```cpp
streambuf_type* get_wrapped() const noexcept;
```

**Returns:** `wrapped`.

```cpp
allocator_type get_allocator() const noexcept;
```

**Returns:** A copy of the allocator that was set in the constructor or assignment operator.

```cpp
void set_emit_on_sync(bool b) noexcept;
```

**Effects:** `emit_on_sync = b`.

29.10.2.5 Overridden virtual functions

```cpp
int sync() override;
```

**Effects:** Records that the wrapped stream buffer is to be flushed. Then, if `emit_on_sync` is `true`, calls `emit()`. [Note: If `emit_on_sync` is `false`, the actual flush is delayed until a call to `emit()`. — end note]

**Returns:** If `emit()` was called and returned `false`, returns `-1`; otherwise `0`.

29.10.2.6 Specialized algorithms

```cpp
template<class charT, class traits, class Allocator>
void swap(basic_syncbuf<charT, traits, Allocator>& a,
          basic_syncbuf<charT, traits, Allocator>& b) noexcept;
```

**Effects:** Equivalent to `a.swap(b)`.

29.10.3 Class template basic_osyncstream

29.10.3.1 Overview

```cpp
namespace std {
  template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
  class basic_osyncstream : public basic_ostream<charT, traits> {
      public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;
        using allocator_type = Allocator;
        using streambuf_type = basic_streambuf<charT, traits>;
        using syncbuf_type = basic_syncbuf<charT, traits, Allocator>;
  }
}
```
29.10.3.2 Construction and destruction

basic_osyncstream(streambuf_type* buf, const Allocator& allocator);

Effects: Initializes sb from buf and allocator. Initializes the base class with basic_ostream<charT, traits>(addressof(sb)).

[Note: The member functions of the provided stream buffer might be called from emit() while a lock is held. Care should be taken to ensure that this does not result in deadlock. — end note]

Postconditions: get_wrapped() == buf is true.

basic_osyncstream(basic_osyncstream&& other) noexcept;

Effects: Move constructs the base class and sb from the corresponding subobjects of other, and calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)).

Postconditions: The value returned by get_wrapped() is the value returned by os.get_wrapped() prior to calling this constructor. nullptr == other.get_wrapped() is true.

29.10.3.3 Member functions

void emit();

Effects: Calls sb.emit(). If that call returns false, calls setstate(ios_base::badbit).

[Example: A flush on a basic_osyncstream does not flush immediately:}

Example: A named variable can be used within a block statement for streaming.

cout(std::cout) << "Hello, " << "World!"; // flush is noted
cout(std::cout) << "and more!\n"; // characters are transferred and cout is flushed
— end example]

Example: A temporary object can be used for streaming within a single statement.

cout(std::cout) << "Hello, " << "World!" << \n; // characters are transferred and cout is flushed

In this example, cout is not flushed. — end example]

```cpp
{  
    osyncstream bout(cout);  
    bout << "Hello," << '\n'; // no flush  
    bout.emit(); // characters transferred; cout not flushed  
    bout << "World!" << endl; // flush noted; cout not flushed  
    bout.emit(); // characters transferred; cout flushed  
    bout << "Greetings." << '\n'; // no flush  
}   // characters transferred; cout not flushed

—end example

Example: The function `emit()` can be used to handle exceptions from operations on the underlying stream.

```cpp
{  
    osyncstream bout(cout);  
    bout << "Hello, " << "World!" << '\n';  
    try {  
        bout.emit();  
    } catch (...) {  
        // handle exception  
    }  
}

—end example
```

streambuf_type* get_wrapped() const noexcept;

Returns: `sb.get_wrapped()`.

Example: Obtaining the wrapped stream buffer with `get_wrapped()` allows wrapping it again with an `osyncstream`. For example,

```cpp
{  
    osyncstream bout1(cout);  
    bout1 << "Hello, ";  
    {  
        osyncstream(bout1.get_wrapped()) << "Goodbye, " << "Planet!" << '\n';  
    }  
    bout1 << "World!" << '\n';  
}  
produces the uninterleaved output
Goodbye, Planet!
Hello, World!

—end example
```

29.11 File systems

29.11.1 General

Subclause 29.11 describes operations on file systems and their components, such as paths, regular files, and directories.

A `file system` is a collection of files and their attributes.

A `file` is an object within a file system that holds user or system data. Files can be written to, or read from, or both. A file has certain attributes, including type. File types include regular files and directories. Other types of files, such as symbolic links, may be supported by the implementation.

A `directory` is a file within a file system that acts as a container of directory entries that contain information about other files, possibly including other directory files. The `parent directory` of a directory is the directory that both contains a directory entry for the given directory and is represented by the dot-dot filename (29.11.7.1) in the given directory. The `parent directory` of other types of files is a directory containing a directory entry for the file under discussion.

A `link` is an object that associates a filename with a file. Several links can associate names with the same file. A `hard link` is a link to an existing file. Some file systems support multiple hard links to a file. If the last hard link to a file is removed, the file itself is removed. [Note: A hard link can be thought of as a shared-ownership
smart pointer to a file. — end note] A symbolic link is a type of file with the property that when the file is encountered during pathname resolution (29.11.7), a string stored by the file is used to modify the pathname resolution. [Note: Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the file pointed to does not exist, the symbolic link is said to be a “dangling” symbolic link. — end note]

### 29.11.2 Conformance [fs.conformance]

1 Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance subclauses take that into account.

#### 29.11.2.1 POSIX conformance [fs.conform.9945]

1 Some behavior is specified by reference to POSIX (29.11.3). How such behavior is actually implemented is unspecified. [Note: This constitutes an “as if” rule allowing implementations to call native operating system or other APIs. — end note]

2 Implementations should provide such behavior as it is defined by POSIX. Implementations shall document any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact POSIX behavior should provide behavior as close to POSIX behavior as is reasonable given the limitations of actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the implementation shall report an error as specified in 29.11.6. [Note: This allows users to rely on an exception being thrown or an error code being set when an implementation cannot provide any reasonable behavior. — end note]

3 Implementations are not required to provide behavior that is not supported by a particular file system. [Example: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system but instead are required to report an error as described above. — end example]

#### 29.11.2.2 Operating system dependent behavior conformance [fs.conform.os]

1 Behavior that is specified as being operating system dependent is dependent upon the behavior and characteristics of an operating system. The operating system an implementation is dependent upon is implementation-defined.

2 It is permissible for an implementation to be dependent upon an operating system emulator rather than the actual underlying operating system.

#### 29.11.2.3 File system race behavior [fs.race.behavior]

1 A file system race is the condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system. Behavior is undefined if calls to functions provided by subclause 29.11.2.3 introduce a file system race.

2 If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, Preconditions: is not specified for the function. [Note: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function. — end note]

### 29.11.3 Normative references [fs.norm.ref]

1 Subclause 29.11 mentions commercially available operating systems for purposes of exposition.\(^{324}\)

### 29.11.4 Requirements [fs.req]

1 Throughout subclause 29.11, char, wchar_t, char8_t, char16_t, and char32_t are collectively called encoded character types.

2 Functions with template parameters named EcharT shall not participate in overload resolution unless EcharT is one of the encoded character types.

3 Template parameters named InputIterator shall meet the Cpp17InputIterator requirements (23.3.5.2) and shall have a value type that is one of the encoded character types.

\(^{324}\) POSIX® is a registered trademark of The IEEE. Windows® is a registered trademark of Microsoft Corporation. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of these products.
5 Template parameters named Allocator shall meet the Cpp17Allocator requirements (Table 36).

29.11.4.1 Namespaces and headers

Unless otherwise specified, references to entities described in subclause 29.11 are assumed to be qualified with ::std::filesystem::.

29.11.5 Header <filesystem> synopsis

```cpp
#include <compare>
// see 17.11.1

namespace std::filesystem {

  // 29.11.7, paths
  class path;

  // 29.11.7.7, path non-member functions
  void swap(path& lhs, path& rhs) noexcept;
  size_t hash_value(const path& p) noexcept;

  // 29.11.8, filesystem errors
  class filesystem_error;

  // 29.11.11, directory entries
  class directory_entry;

  // 29.11.12, directory iterators
  class directory_iterator;

  // 29.11.12.2, range access for directory iterators
  directory_iterator begin(directory_iterator iter) noexcept;
  directory_iterator end(const directory_iterator&) noexcept;

  // 29.11.13, recursive directory iterators
  class recursive_directory_iterator;

  // 29.11.13.2, range access for recursive directory iterators
  recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;
  recursive_directory_iterator end(const recursive_directory_iterator&) noexcept;

  // 29.11.10, file status
  class file_status;

  struct space_info {
    uintmax_t capacity;
    uintmax_t free;
    uintmax_t available;

path proximate(const path& p, const path& base, error_code& ec);

path read_symlink(const path& p);
path read_symlink(const path& p, error_code& ec);

path relative(const path& p, error_code& ec);
path relative(const path& p, const path& base = current_path());
path relative(const path& p, const path& base, error_code& ec);

bool remove(const path& p);
bool remove(const path& p, error_code& ec) noexcept;

uintmax_t remove_all(const path& p);
uintmax_t remove_all(const path& p, error_code& ec);

void rename(const path& from, const path& to);
void rename(const path& from, const path& to, error_code& ec) noexcept;

void resize_file(const path& p, uintmax_t size);
void resize_file(const path& p, uintmax_t size, error_code& ec) noexcept;
Implementations should ensure that the resolution and range of `file_time_type` reflect the operating system dependent resolution and range of file time values.

### 29.11.6 Error reporting [fs.err.report]

Filesystem library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an `error_code`. [Note: This supports two common use cases:

(1.1) Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.

(1.2) Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.

— end note]

1 Functions not having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

(2.1) When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type `filesystem_error` shall be thrown. For functions with a single path argument, that argument shall be passed to the `filesystem_error` constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the `filesystem_error` constructor as the `path1` argument, and the second shall be passed as the `path2` argument. The `filesystem_error` constructor's `error_code` argument is set as appropriate for the specific operating system dependent error.

(2.2) Failure to allocate storage is reported by throwing an exception as described in 16.5.5.13.

(2.3) Destructors throw nothing.

2 Functions having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

(3.1) If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the `error_code&` argument is set as appropriate for the specific operating system dependent error. Otherwise, `clear()` is called on the `error_code&` argument.

### 29.11.7 Class path [fs.class.path]

An object of class `path` represents a path and contains a pathname. Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.

[Note: Class path is used to support the differences between the string types used by different operating systems to represent pathnames, and to perform conversions between encodings when necessary. — end note]
A path is a sequence of elements that identify the location of a file within a filesystem. The elements are the root-name_opt, root-directory_opt, and an optional sequence of filenames (29.11.7.1). The maximum number of elements in the sequence is operating system dependent (29.11.2.2).

An absolute path is a path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent. A relative path is a path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent. [Note: Pathnames “.” and “..” are relative paths. — end note]

A pathname is a character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar (29.11.7.1) or according to an operating system dependent native pathname format accepted by the host operating system.

Pathname resolution is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file. [Example: POSIX specifies the mechanism in section 4.11, Pathname resolution. — end example]

```cpp
namespace std::filesystem {
    class path {
        public:
            using value_type = see below;
            using string_type = basic_string<value_type>;
            static constexpr value_type preferred_separator = see below;

            // 29.11.9.1, enumeration format
            enum format;

            // 29.11.7.4.1, constructors and destructor
            path() noexcept;
            path(const path& p);
            path(path&& p) noexcept;
            path(string_type&& source, format fmt = auto_format);
            template<class Source>
                path(const Source& source, format fmt = auto_format);
            template<class InputIterator>
                path(InputIterator first, InputIterator last, format fmt = auto_format);
            ~path();

            // 29.11.7.4.2, assignments

7 value_type is a typedef for the operating system dependent encoded character type used to represent
pathnames.

8 The value of the preferred_separator member is the operating system dependent preferred-separator
character (29.11.7.1).

9 [Example: For POSIX-based operating systems, value_type is char and preferred_separator is the slash
character (‘/’). For Windows-based operating systems, value_type is wchar_t and preferred_separator
is the backslash character (L’\’). — end example]

29.11.7.1 Generic pathname format

pathname:
  root-name_opt root-directory_opt relative-path

root-name:
  operating system dependent sequences of characters
  implementation-defined sequences of characters

root-directory:
  directory-separator

relative-path:
  filename
  filename directory-separator relative-path
  an empty path
filename:
    non-empty sequence of characters other than directory-separator characters

directory-separator:
    preferred-separator directory-separator, opt
    fallback-separator directory-separator, opt

preferred-separator:
    operating system dependent directory separator character

fallback-separator:
    /, if preferred-separator is not /

1 A filename is the name of a file. The dot and dot-dot filenames, consisting solely of one and two period characters respectively, have special meaning. The following characteristics of filenames are operating system dependent:

(1.1) — The permitted characters. [Example: Some operating systems prohibit the ASCII control characters (0x00 – 0x1F) in filenames. — end example] [Note: For wide portability, users may wish to limit filename characters to the POSIX Portable Filename Character Set:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
a b c d e f g h i j k l m n o p q r s t u v w x y z
0 1 2 3 4 5 6 7 8 9 . _ - — end note]

(1.2) — The maximum permitted length.

(1.3) — Filenames that are not permitted.

(1.4) — Filenames that have special meaning.

(1.5) — Case awareness and sensitivity during path resolution.

(1.6) — Special rules that may apply to file types other than regular files, such as directories.

2 Except in a root-name, multiple successive directory-separator characters are considered to be the same as one directory-separator character.

3 The dot filename is treated as a reference to the current directory. The dot-dot filename is treated as a reference to the parent directory. What the dot-dot filename refers to relative to root-directory is implementation-defined. Specific filenames may have special meanings for a particular operating system.

4 A root-name identifies the starting location for pathname resolution (29.11.7). If there are no operating system dependent root-names, at least one implementation-defined root-name is required. [Note: Many operating systems define a name beginning with two directory-separator characters as a root-name that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier — a root-name identifying a specific device such as a disk drive. — end note]

5 If a root-name is otherwise ambiguous, the possibility with the longest sequence of characters is chosen. [Note: On a POSIX-like operating system, it is impossible to have a root-name and a relative-path without an intervening root-directory element. — end note]

6 Normalization of a generic format pathname means:

1. If the path is empty, stop.
2. Replace each slash character in the root-name with a preferred-separator.
3. Replace each directory-separator with a preferred-separator. [Note: The generic pathname grammar (29.11.7.1) defines directory-separator as one or more slashes and preferred-separators. — end note]
4. Remove each dot filename and any immediately following directory-separator.
5. As long as any appear, remove a non-dot-dot filename immediately followed by a directory-separator and a dot-dot filename, along with any immediately following directory-separator.
6. If there is a root-directory, remove all dot-dot filenames and any directory-separators immediately following them. [Note: These dot-dot filenames attempt to refer to nonexistent parent directories. — end note]
7. If the last filename is dot-dot, remove any trailing directory-separator.
8. If the path is empty, add a dot.

The result of normalization is a path in normal form, which is said to be normalized.
29.11.7.2 Conversions [fs.path.cvt]

29.11.7.2.1 Argument format conversions [fs.path.fmt.cvt]

1 [Note: The format conversions described in this subclause are not applied on POSIX-based operating systems because on these systems:

(1.1) — The generic format is acceptable as a native path.
(1.2) — There is no need to distinguish between native format and generic format in function arguments.
(1.3) — Paths for regular files and paths for directories share the same syntax.

— end note]

2 Several functions are defined to accept detected-format arguments, which are character sequences. A detected-format argument represents a path using either a pathname in the generic format (29.11.7.1) or a pathname in the native format (29.11.7). Such an argument is taken to be in the generic format if and only if it matches the generic format and is not acceptable to the operating system as a native path.

3 [Note: Some operating systems may have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. An implementation for an operating system where disambiguation is required is permitted to distinguish between the formats. — end note]

4 Pathnames are converted as needed between the generic and native formats in an operating-system-dependent manner. Let \( G(n) \) and \( N(g) \) in a mathematical sense be the implementation’s functions that convert native-to-generic and generic-to-native formats respectively. If \( g = G(n) \) for some \( n \), then \( G(N(g)) = g \); if \( n = N(g) \) for some \( g \), then \( N(G(n)) = n \). [Note: Neither \( G \) nor \( N \) need be invertible. — end note]

5 If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a directory-separator, otherwise it shall be treated as a path to a regular file.

6 [Note: A path stores a native format pathname (29.11.7.4.6) and acts as if it also stores a generic format pathname, related as given below. The implementation may generate the generic format pathname based on the native format pathname (and possibly other information) when requested. — end note]

7 When a path is constructed from or is assigned a single representation separate from any path, the other representation is selected by the appropriate conversion function (\( G \) or \( N \)).

8 When the (new) value \( p \) of one representation of a path is derived from the representation of that or another path, a value \( q \) is chosen for the other representation. The value \( q \) converts to \( p \) (by \( G \) or \( N \) as appropriate) if any such value does so; \( q \) is otherwise unspecified. [Note: If \( q \) is the result of converting any path at all, it is the result of converting \( p \). — end note]

29.11.7.2.2 Type and encoding conversions [fs.path.type.cvt]

1 The native encoding of an ordinary character string is the operating system dependent current encoding for pathnames (29.11.7). The native encoding for wide character strings is the implementation-defined execution wide-character set encoding (5.3).

2 For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from \texttt{path::value_type}. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:

(2.1) — \texttt{char}: The encoding is the native ordinary encoding. The method of conversion, if any, is operating system dependent. [Note: For POSIX-based operating systems \texttt{path::value_type} is \texttt{char} so no conversion from \texttt{char} value type arguments or to \texttt{char} value type return values is performed. For Windows-based operating systems, the native ordinary encoding is determined by calling a Windows API function. — end note] [Note: This results in behavior identical to other C and C++ standard library functions that perform file operations using ordinary character strings to identify paths. Changing this behavior would be surprising and error prone. — end note]

(2.2) — \texttt{wchar_t}: The encoding is the native wide encoding. The method of conversion is unspecified. [Note: For Windows-based operating systems \texttt{path::value_type} is \texttt{wchar_t} so no conversion from \texttt{wchar_t} value type arguments or to \texttt{wchar_t} value type return values is performed. — end note]

(2.3) — \texttt{char8_t}: The encoding is UTF-8. The method of conversion is unspecified.
ISO/IEC JTC1 SC22 WG21 N4860

(2.4) — char16_t: The encoding is UTF-16. The method of conversion is unspecified.

(2.5) — char32_t: The encoding is UTF-32. The method of conversion is unspecified.

3 If the encoding being converted to has no representation for source characters, the resulting converted
   characters, if any, are unspecified. Implementations should not modify member function arguments if already
   of type path::value_type.

29.11.7.3 Requirements [fs.path.req]

1 In addition to the requirements (29.11.4), function template parameters named Source shall be one of:

(1.1) — basic_string<EcharT, traits, Allocator>. A function argument const Source& source shall have an effective range [source.begin(), source.end()).

(1.2) — basic_string_view<EcharT, traits>. A function argument const Source& source shall have an effective range [source.begin(), source.end()).

(1.3) — A type meeting the Cpp17InputIterator requirements that iterates over a NTCTS. The value type
   shall be an encoded character type. A function argument const Source& source shall have an effective range [source, end) where end is the first iterator value with an element value equal to iterator_traits<Source>::value_type().

(1.4) — A character array that after array-to-pointer decay results in a pointer to the start of a NTCTS. The
   value type shall be an encoded character type. A function argument const Source& source shall have an effective range [source, end) where end is the first iterator value with an element value equal to iterator_traits<decay_t<Source>>::value_type().

2 Functions taking template parameters named Source shall not participate in overload resolution unless
   Source denotes a type other than path, and either

(2.1) — Source is a specialization of basic_string or basic_string_view, or

(2.2) — the qualified-id iterator_traits<decay_t<Source>>::value_type is valid and denotes a possibly
   const encoded character type (13.10.2).

3 [Note: See path conversions (29.11.7.2) for how the value types above and their encodings convert to
   path::value_type and its encoding. — end note]

4 Arguments of type Source shall not be null pointers.

29.11.7.4 Members [fs.path.member]

29.11.7.4.1 Constructors [fs.path.construct]

path() noexcept;

Postconditions: empty() == true.

path(const path& p);
path(path&& p) noexcept;

Effects: Constructs an object of class path having the same pathname in the native and generic formats,
respectivey, as the original value of p. In the second form, p is left in a valid but unspecified state.

path(string_type&& source, format fmt = auto_format);

Effects: Constructs an object of class path for which the pathname in the detected-format of source
has the original value of source (29.11.7.2.1), converting format if required (29.11.7.2.1). source is
left in a valid but unspecified state.

template<class Source>
path(const Source& source, format fmt = auto_format);

template<class InputIterator>
path(InputIterator first, InputIterator last, format fmt = auto_format);

Effects: Let s be the effective range of source (29.11.7.3) or the range [first, last), with the
encoding converted if required (29.11.7.2). Finds the detected-format of s (29.11.7.2.1) and constructs
an object of class path for which the pathname in that format is s.

template<class Source>
path(const Source& source, const locale& loc, format fmt = auto_format);
template<class InputIterator>
path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);

Mandates: The value type of Source and InputIterator is char.

Effects: Let s be the effective range of source or the range \([first, last)\), after converting the encoding as follows:

- If value_type is wchar_t, converts to the native wide encoding (29.11.7.2.2) using the codecvt<wchar_t, char, mbstate_t> facet of loc.
- Otherwise a conversion is performed using the codecvt<wchar_t, char, mbstate_t> facet of loc, and then a second conversion to the current ordinary encoding.

Finds the detected-format of \(s\) (29.11.7.2.1) and constructs an object of class path for which the pathname in that format is \(s\).

[Example: A string is to be read from a database that is encoded in ISO/IEC 8859-1, and used to create a directory:

```cpp
namespace fs = std::filesystem;
std::string latin1_string = read_latin1_data();
codecvt_8859_1<wchar_t> latin1_facet;
std::locale latin1_locale(std::locale(), latin1_facet);
fs::create_directory(fs::path(latin1_string, latin1_locale));
```

For POSIX-based operating systems, the path is constructed by first using latin1_facet to convert ISO/IEC 8859-1 encoded latin1_string to a wide character string in the native wide encoding (29.11.7.2.2). The resulting wide string is then converted to an ordinary character pathname string in the current ordinary encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native ordinary encoding is UTF-8, all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but for other native ordinary encodings some characters may have no representation.

For Windows-based operating systems, the path is constructed by using latin1_facet to convert ISO/IEC 8859-1 encoded latin1_string to a UTF-16 encoded wide character pathname string. All of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation.

— end example]

29.11.7.4.2 Assignments

path& operator=(const path& p);

Effects: If \(*this\) and \(p\) are the same object, has no effect. Otherwise, sets both respective pathnames of \(*this\) to the respective pathnames of \(p\).

Returns: \(*this\).

path& operator=(path&& p) noexcept;

Effects: If \(*this\) and \(p\) are the same object, has no effect. Otherwise, sets both respective pathnames of \(*this\) to the respective pathnames of \(p\). \(p\) is left in a valid but unspecified state. [Note: A valid implementation is swap(p). — end note]

Returns: \(*this\).

path& operator=(string_type&& source);
path& assign(string_type&& source);

Effects: Sets the pathname in the detected-format of \(source\) to the original value of \(source\). \(source\) is left in a valid but unspecified state.

Returns: \(*this\).
template<class InputIterator>
    path& assign(InputIterator first, InputIterator last);

Effects: Let s be the effective range of source (29.11.7.3) or the range [first, last), with the encoding converted if required (29.11.7.2). Finds the detected-format of s (29.11.7.2.1) and sets the pathname in that format to s.

Returns: *this.

29.11.7.4.3 Appends

The append operations use operator/= to denote their semantic effect of appending preferred-separator when needed.

path& operator/=(const path& p);

Effects: If p.is_absolute() || (p.has_root_name() & p.root_name() != root_name()), then operator=(p).

Otherwise, modifies *this as if by these steps:

— If p.has_root_directory(), then removes any root directory and relative path from the generic format pathname. Otherwise, if !has_root_directory() && is_absolute() is true or if has_root_name() is true, then appends path::preferred_separator to the generic format pathname.

— Then appends the native format pathname of p, omitting any root-name from its generic format pathname, to the native format pathname.

Example: Even if //host is interpreted as a root-name, both of the paths path("//host")/"foo" and path("//host")/"foo" equal "/host/foo" (although the former might use backslash as the preferred separator).

Expression examples:

    // On POSIX,
    path("foo") /= path(""); // yields path("foo")
    path("foo") /= path("/bar"); // yields path("/bar")

    // On Windows,
    path("foo") /= path(""); // yields path("foo")
    path("foo") /= path("/bar"); // yields path("/bar")
    path("foo") /= path("c:\bar"); // yields path("c:\bar")
    path("foo") /= path("c:"); // yields path("c:")
    path("c:" /= path("")); // yields path("c:")
    path("c:foo") /= path("/bar"); // yields path("c:bar")
    path("c:foo") /= path("c:bar"); // yields path("c:foo\bar")

— end example

Returns: *this.

template<class Source>
    path& operator/=(const Source& source);

template<class Source>
    path& append(const Source& source);

Effects: Equivalent to: return operator/=(path(source));

template<class InputIterator>
    path append(InputIterator first, InputIterator last);

Effects: Equivalent to: return operator/=(path(first, last));

29.11.7.4.4 Concatenation

path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);
template<class Source>
    path& operator+=(const Source& x);
template<class Source>
    path& concat(const Source& x);

    Effects: Appends path(x).native() to the pathname in the native format. [Note: This directly manipulates the value of native() and may not be portable between operating systems. — end note]

    Returns: *this.

    path& operator+=(value_type x);
    template<class EcharT>
        path& operator+=(EcharT x);

    Effects: Equivalent to: return *this += basic_string_view(&x, 1);

    template<class InputIterator>
        path& concat(InputIterator first, InputIterator last);

    Effects: Equivalent to: return *this += path(first, last);

29.11.7.4.5 Modifiers

    void clear() noexcept;

    Postconditions: empty() == true.

    path& make_preferred();

    Effects: Each directory-separator of the pathname in the generic format is converted to preferred-separator.

    Returns: *this.

    [Example:
        path p("foo/bar");
        std::cout << p << std::endl;
        p.make_preferred();
        std::cout << p << std::endl;
    ]

    path& remove_filename();

    Effects: Remove the generic format pathname of filename() from the generic format pathname.

    Postconditions: !has_filename().

    Returns: *this.

    [Example:
        path("foo/bar").remove_filename(); // yields "foo/
        path("foo/").remove_filename();     // yields "foo/
        path("/foo").remove_filename();     // yields "/
        path("/").remove_filename();       // yields "/
    ]

    path& replace_filename(const path& replacement);

    Effects: Equivalent to:
        remove_filename();
        operator/=(replacement);

    Returns: *this.

    [Example:
        path("/foo").replace_filename("bar");  // yields "/bar" on POSIX
path("/").replace_filename("bar"); // yields "/bar" on POSIX

— end example]

path& replace_extension(const path& replacement = path());

Effects:
(12.1) Any existing extension() (29.11.4.9) is removed from the pathname in the generic format, then
(12.2) If replacement is not empty and does not begin with a dot character, a dot character is appended
      to the pathname in the generic format, then
(12.3) operator+= (replacement);

Returns: *this.

void swap(path& rhs) noexcept;

Effects: Swaps the contents (in all formats) of the two paths.

Complexity: Constant time.

29.11.7.4.6 Native format observers [fs.path.native.obs]
The string returned by all native format observers is in the native pathname format (29.11.7).

const string_type& native() const noexcept;

Returns: The pathname in the native format.

const value_type* c_str() const noexcept;

Effects: Equivalent to: return native().c_str();

operator string_type() const;

Returns: native().

[Note: Conversion to string_type is provided so that an object of class path can be given as an
argument to existing standard library file stream constructors and open functions. — end note]

template<class EcharT, class traits = char_traits<EcharT>,
class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
string(const Allocator& a = Allocator()) const;

Returns: native().

Remarks: All memory allocation, including for the return value, shall be performed by a. Conversion,
if any, is specified by 29.11.7.2.

std::string string() const;
std::wstring wstring() const;
std::u16string u16string() const;
std::u32string u32string() const;

Returns: native().

Remarks: Conversion, if any, is performed as specified by 29.11.7.2.

29.11.7.4.7 Generic format observers [fs.path.generic.obs]
Generic format observer functions return strings formatted according to the generic pathname format
(29.11.7.1). A single slash ("/") character is used as the directory-separator.

[Example: On an operating system that uses backslash as its preferred-separator,
path("foo\bar").generic_string() returns "foo/bar". — end example]

template<class EcharT, class traits = char_traits<EcharT>,
class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
generic_string(const Allocator& a = Allocator()) const;

Returns: The pathname in the generic format.

Remarks: All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 29.11.7.2.

std::string generic_string() const;
std::wstring generic_wstring() const;
std::u8string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;

Returns: The pathname in the generic format.

Remarks: Conversion, if any, is specified by 29.11.7.2.

29.11.7.4.8 Compare

int compare(const path& p) const noexcept;

Returns:

(1.1) Let rootNameComparison be the result of this->root_name().native().compare(p.root_name().native()). If rootNameComparison is not 0, rootNameComparison.

(1.2) Otherwise, if !this->has_root_directory() and p.has_root_directory(), a value less than 0.

(1.3) Otherwise, if this->has_root_directory() and !p.has_root_directory(), a value greater than 0.

(1.4) Otherwise, if native() for the elements of this->relative_path() are lexicographically less than native() for the elements of p.relative_path(), a value less than 0.

(1.5) Otherwise, if native() for the elements of this->relative_path() are lexicographically greater than native() for the elements of p.relative_path(), a value greater than 0.

(1.6) Otherwise, 0.

Effects: Equivalent to: return compare(path(s));

29.11.7.4.9 Decomposition

path root_name() const;

Returns: root-name, if the pathname in the generic format includes root-name, otherwise path().

path root_directory() const;

Returns: root-directory, if the pathname in the generic format includes root-directory, otherwise path().

path root_path() const;

Returns: root_name() / root_directory().

path relative_path() const;

Returns: A path composed from the pathname in the generic format, if empty() is false, beginning with the first filename after root_path(). Otherwise, path().

path parent_path() const;

Returns: *this if has_relative_path() is false, otherwise a path whose generic format pathname is the longest prefix of the generic format pathname of *this that produces one fewer element in its iteration.

path filename() const;

Returns: relative_path().empty() ? path() : *--end().
Example:

```
path("/foo/bar.txt").filename(); // yields "bar.txt"
path("/foo/bar").filename();    // yields "bar"
path("/foo/bar/").filename();   // yields ""
path("/host").filename();       // yields ""
path(".").filename();           // yields "."  
path("..").filename();          // yields "."  
```

— end example

```
path stem() const;
```

Returns: Let $f$ be the generic format pathname of `filename()`. Returns a path whose pathname in the generic format is

- $f$, if it contains no periods other than a leading period or consists solely of one or two periods;
- otherwise, the prefix of $f$ ending before its last period.

Example:

```
std::cout << path("/foo/bar.txt").stem();   // outputs "bar"
path p = "foo.bar.baz.tar";
for (; !p.extension().empty(); p = p.stem())
  std::cout << p.extension() << \\
             // output: .tar          
             // .baz               
             // .bar
```

— end example

```
path extension() const;
```

Returns: A path whose pathname in the generic format is the suffix of `filename()` not included in `stem()`.

Example:

```
path("/foo/bar.txt").extension();  // yields ".txt" and stem() is "bar"
path("/foo/bar").extension();     // yields "" and stem() is "bar"
path("/foo/profile").extension(); // yields "" and stem() is "profile"
path(".bar").extension();        // yields "" and stem() is ".bar"
path("..ar").extension();       // yields ".bar" and stem() is "."
```

— end example

Note: The period is included in the return value so that it is possible to distinguish between no extension and an empty extension. — end note

Note: On non-POSIX operating systems, for a path $p$, it may not be the case that $p.stem() + p.extension() == p.filename()$, even though the generic format pathnames are the same. — end note

29.11.7.4.10 Query

```
[[nodiscard]] bool empty() const noexcept;
```

Returns: true if the pathname in the generic format is empty, otherwise false.

bool has_root_path() const;

Returns: !root_path().empty().

bool has_root_name() const;

Returns: !root_name().empty().

bool has_root_directory() const;

Returns: !root_directory().empty().

§ 29.11.7.4.10 © ISO/IEC 2020 – All rights reserved 1454
bool has_relative_path() const;
Returns: !relative_path().empty().

bool has_parent_path() const;
Returns: !parent_path().empty().

bool has_filename() const;
Returns: !filename().empty().

bool has_stem() const;
Returns: !stem().empty().

bool has_extension() const;
Returns: !extension().empty().

bool is_absolute() const;
Returns: true if the pathname in the native format contains an absolute path (29.11.7), otherwise false.

[Example: path("/").is_absolute() is true for POSIX-based operating systems, and false for Windows-based operating systems. — end example]

bool is_relative() const;
Returns: !is_absolute().

29.11.7.4.11 Generation [fs.path.gen]

path lexically_normal() const;
Returns: A path whose pathname in the generic format is the normal form (29.11.7.1) of the pathname in the generic format of *this.

[Example:
assert(path("foo/.bar/..").lexically_normal() == "foo/");
assert(path("foo/..bar/..").lexically_normal() == "foo/");
The above assertions will succeed. On Windows, the returned path’s directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. — end example]

path lexically_relative(const path& base) const;
Returns: *this made relative to base. Does not resolve (29.11.7) symlinks. Does not first normalize (29.11.7.1) *this or base.

Effects: If:
(4.1) root_name() != base.root_name() is true, or
(4.2) is_absolute() != base.is_absolute() is true, or
(4.3) !has_root_directory() && base.has_root_directory() is true, or
(4.4) any filename in relative_path() or base.relative_path() can be interpreted as a root-name, returns path(). [Note: On a POSIX implementation, no filename in a relative-path is acceptable as a root-name. — end note] Determines the first mismatched element of *this and base as if by:
auto [a, b] = mismatch(begin(), end(), base.begin(), base.end());
Then,
(4.5) if a == end() and b == base.end(), returns path("."); otherwise
(4.6) let n be the number of filename elements in [b, base.end()) that are not dot or dot-dot or empty, minus the number that are dot-dot. If n<0, returns path(); otherwise
(4.7) if n == 0 and (a == end() || a->empty()), returns path("."); otherwise
(4.8) returns an object of class path that is default-constructed, followed by
(4.8.1) application of operator/=(path("..") n times, and then
application of operator/= for each element in [a, end()).

Example:

```cpp
assert(path("/a/d").lexically_relative("/a/b/c") == "./.d");
assert(path("/a/b/c").lexically_relative("/a/d") == ".b/c");
assert(path("/a/b/c").lexically_relative("a") == "b/c");
assert(path("/a/b/c").lexically_relative("a/b/c/x/y") == "./.x/y");
assert(path("/a/b/c").lexically_relative("a/b/c") == ".");
assert(path("/a/b").lexically_relative("c/d") == "/../a/b");
```

The above assertions will succeed. On Windows, the returned path's directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. — end example

Note: If symlink following semantics are desired, use the operational function relative(). — end note

Note: If normalization (29.11.7.1) is needed to ensure consistent matching of elements, apply lexically_normal() to *this, base, or both. — end note

path lexically_proximate(const path& base) const;

Returns: If the value of lexically_relative(base) is not an empty path, return it. Otherwise return *this.

Note: If symlink following semantics are desired, use the operational function proximate(). — end note

Note: If normalization (29.11.7.1) is needed to ensure consistent matching of elements, apply lexically_normal() to *this, base, or both. — end note

29.11.7.5 Iterators

Path iterators iterate over the elements of the pathname in the generic format (29.11.7.1).

A path::iterator is a constant iterator meeting all the requirements of a bidirectional iterator (23.3.5.5) except that, for dereferenceable iterators a and b of type path::iterator with a == b, there is no requirement that *a and *b are bound to the same object. Its value_type is path.

Calling any non-const member function of a path object invalidates all iterators referring to elements of that object.

For the elements of the pathname in the generic format, the forward traversal order is as follows:

1. The root-name element, if present.
2. The root-directory element, if present. [Note: The generic format is required to ensure lexicographical comparison works correctly. — end note]
3. Each successive filename element, if present.
4. An empty element, if a trailing non-root directory-separator is present.

The backward traversal order is the reverse of forward traversal.

```
iterator begin() const;

Returns: An iterator for the first present element in the traversal list above. If no elements are present, the end iterator.
```

```
iterator end() const;

Returns: The end iterator.
```

29.11.7.6 Inserter and extractor

```
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const path& p);
```

Effects: Equivalent to os << quoted(p.string<charT, traits>().) [Note: The quoted function is described in 29.7.8. — end note]

Returns: os.
template<class charT, class traits>
friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, path& p);

Effects: Equivalent to:
    basic_string<charT, traits> tmp;
    is >> quoted(tmp);
    p = tmp;

Returns: is.

29.11.7.7 Non-member functions

void swap(path& lhs, path& rhs) noexcept;
Effects: Equivalent to lhs.swap(rhs).

size_t hash_value(const path& p) noexcept;
Returns: A hash value for the path p. If for two paths, p1 == p2 then hash_value(p1) == hash_value(p2).

friend bool operator==(const path& lhs, const path& rhs) noexcept;
Returns: lhs.compare(rhs) == 0.

[Note: Path equality and path equivalence have different semantics.

(4.1) — Equality is determined by the path non-member operator==, which considers the two paths’ lexical representations only. [Example: path("foo") == "bar" is never true. — end example]

(4.2) — Equivalence is determined by the equivalent() non-member function, which determines if two paths resolve (29.11.7) to the same file system entity. [Example: equivalent("foo", "bar") will be true when both paths resolve to the same file. — end example]

Programmers wishing to determine if two paths are “the same” must decide if “the same” means “the same representation” or “resolve to the same actual file”, and choose the appropriate function accordingly. — end note]

friend strong_ordering operator<=>(const path& lhs, const path& rhs) noexcept;
Returns: lhs.compare(rhs) <=> 0.

friend path operator/(const path& lhs, const path& rhs);
Effects: Equivalent to: return path(lhs) /= rhs;

29.11.8 Class filesystem_error

namespace std::filesystem {
    class filesystem_error : public system_error {
        public:
            filesystem_error(const string& what_arg, error_code ec);
            filesystem_error(const string& what_arg,
                const path& p1, error_code ec);
            filesystem_error(const string& what_arg,
                const path& p1, const path& p2, error_code ec);

            const path& path1() const noexcept;
            const path& path2() const noexcept;
            const char* what() const noexcept override;
    };
}

1 The class filesystem_error defines the type of objects thrown as exceptions to report file system errors from functions described in subclause 29.11.

29.11.8.1 Members

Constructors are provided that store zero, one, or two paths associated with an error.

§ 29.11.8.1 ©ISO/IEC 2020 – All rights reserved
filesystem_error(const string& what_arg, error_code ec);

**Postconditions:**
- code() == ec,
- path1().empty() == true,
- path2().empty() == true, and
- string_view(what()).find(what_arg.c_str()) != string_view::npos.

filesystem_error(const string& what_arg, const path& p1, error_code ec);

**Postconditions:**
- code() == ec,
- path1() returns a reference to the stored copy of p1,
- path2().empty() == true, and
- string_view(what()).find(what_arg.c_str()) != string_view::npos.

filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);

**Postconditions:**
- code() == ec,
- path1() returns a reference to the stored copy of p1,
- path2() returns a reference to the stored copy of p2, and
- string_view(what()).find(what_arg.c_str()) != string_view::npos.

const path& path1() const noexcept;

**Returns:** A reference to the copy of p1 stored by the constructor, or, if none, an empty path.

const path& path2() const noexcept;

**Returns:** A reference to the copy of p2 stored by the constructor, or, if none, an empty path.

const char* what() const noexcept override;

**Returns:** An NTBS that incorporates the what_arg argument supplied to the constructor. The exact format is unspecified. Implementations should include the system_error::what() string and the pathnames of path1 and path2 in the native format in the returned string.

29.11.9 Enumerations

29.11.9.1 Enum path::format

This enum specifies constants used to identify the format of the character sequence, with the meanings listed in Table 128.

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>native_format</td>
<td>The native pathname format.</td>
</tr>
<tr>
<td>generic_format</td>
<td>The generic pathname format.</td>
</tr>
<tr>
<td>auto_format</td>
<td>The interpretation of the format of the character sequence is implementation-defined. The implementation may inspect the content of the character sequence to determine the format. [Note: For POSIX-based systems, native and generic formats are equivalent and the character sequence should always be interpreted in the same way. — end note]</td>
</tr>
</tbody>
</table>

29.11.9.2 Enum class file_type

This enum class specifies constants used to identify file types, with the meanings listed in Table 129. The values of the constants are distinct.
### Table 129: Enum class file_type

<table>
<thead>
<tr>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>The type of the file has not been determined or an error occurred while trying to determine the type.</td>
</tr>
<tr>
<td>not_found</td>
<td>Pseudo-type indicating the file was not found. [Note: The file not being found is not considered an error while determining the type of a file. —end note]</td>
</tr>
<tr>
<td>regular</td>
<td>Regular file</td>
</tr>
<tr>
<td>directory</td>
<td>Directory file</td>
</tr>
<tr>
<td>symlink</td>
<td>Symbolic link file</td>
</tr>
<tr>
<td>block</td>
<td>Block special file</td>
</tr>
<tr>
<td>character</td>
<td>Character special file</td>
</tr>
<tr>
<td>fifo</td>
<td>FIFO or pipe file</td>
</tr>
<tr>
<td>socket</td>
<td>Socket file</td>
</tr>
<tr>
<td>implementation-defined</td>
<td>Implementations that support file systems having file types in addition to the above file_type types shall supply implementation-defined file_type constants to separately identify each of those additional file types</td>
</tr>
<tr>
<td>unknown</td>
<td>The file exists but the type could not be determined</td>
</tr>
</tbody>
</table>

#### 29.11.9.3 Enum class copy_options

The enum class type copy_options is a bitmask type (16.4.2.2.4) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in Table 130. The constant none represents the empty bitmask, and is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Every other constant in the table represents a distinct bitmask element.

<table>
<thead>
<tr>
<th>Option group controlling copy_file function effects for existing target files</th>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>(Default) Error; file already exists.</td>
<td></td>
</tr>
<tr>
<td>skip_existing</td>
<td>Do not overwrite existing file, do not report an error.</td>
<td></td>
</tr>
<tr>
<td>overwrite_existing</td>
<td>Overwrite the existing file.</td>
<td></td>
</tr>
<tr>
<td>update_existing</td>
<td>Overwrite the existing file if it is older than the replacement file.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option group controlling copy function effects for sub-directories</th>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>(Default) Do not copy sub-directories.</td>
<td></td>
</tr>
<tr>
<td>recursive</td>
<td>Recursively copy sub-directories and their contents.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option group controlling copy function effects for symbolic links</th>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>(Default) Follow symbolic links.</td>
<td></td>
</tr>
<tr>
<td>copy_symlinks</td>
<td>Copy symbolic links as symbolic links rather than copying the files that they point to.</td>
<td></td>
</tr>
<tr>
<td>skip_symlinks</td>
<td>Ignore symbolic links.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option group controlling copy function effects for choosing the form of copying</th>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>(Default) Copy content.</td>
<td></td>
</tr>
<tr>
<td>directories_only</td>
<td>Copy directory structure only, do not copy non-directory files.</td>
<td></td>
</tr>
<tr>
<td>create_symlinks</td>
<td>Make symbolic links instead of copies of files. The source path shall be an absolute path unless the destination path is in the current directory.</td>
<td></td>
</tr>
<tr>
<td>create_hard_links</td>
<td>Make hard links instead of copies of files.</td>
<td></td>
</tr>
</tbody>
</table>
29.11.9.4 Enum class perms

The enum class type perms is a bitmask type (16.4.2.2.4) that specifies bitmask constants used to identify file permissions, with the meanings listed in Table 131.

<table>
<thead>
<tr>
<th>Name</th>
<th>Value (octal)</th>
<th>POSIX macro</th>
<th>Definition or notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>0</td>
<td>S_IRUSR</td>
<td>There are no permissions set for the file.</td>
</tr>
<tr>
<td>owner_read</td>
<td>0400</td>
<td>S_IWUSR</td>
<td>Read permission, owner</td>
</tr>
<tr>
<td>owner_write</td>
<td>0200</td>
<td>S_IXUSR</td>
<td>Write permission, owner</td>
</tr>
<tr>
<td>owner_exec</td>
<td>0100</td>
<td>S_IRWXU</td>
<td>Execute/search permission, owner</td>
</tr>
<tr>
<td>owner_all</td>
<td>0700</td>
<td>S_IRWXU</td>
<td>Read, write, execute/search by owner:</td>
</tr>
<tr>
<td>group_read</td>
<td>040</td>
<td>S_IRGRP</td>
<td>Read permission, group</td>
</tr>
<tr>
<td>group_write</td>
<td>020</td>
<td>S_IWGRP</td>
<td>Write permission, group</td>
</tr>
<tr>
<td>group_exec</td>
<td>010</td>
<td>S_IXGRP</td>
<td>Execute/search permission, group</td>
</tr>
<tr>
<td>group_all</td>
<td>070</td>
<td>S_IRWXG</td>
<td>Read, write, execute/search by group;</td>
</tr>
<tr>
<td>others_read</td>
<td>04</td>
<td>S_IROTH</td>
<td>Read permission, others</td>
</tr>
<tr>
<td>others_write</td>
<td>02</td>
<td>S_IWOTH</td>
<td>Write permission, others</td>
</tr>
<tr>
<td>others_exec</td>
<td>01</td>
<td>S_IXOTH</td>
<td>Execute/search permission, others</td>
</tr>
<tr>
<td>others_all</td>
<td>07</td>
<td>S_IRWXO</td>
<td>Read, write, execute/search by others;</td>
</tr>
<tr>
<td>all</td>
<td>0777</td>
<td>owner_all</td>
<td>owner_all</td>
</tr>
<tr>
<td>set_uid</td>
<td>04000</td>
<td>S_ISUID</td>
<td>Set-user-ID on execution</td>
</tr>
<tr>
<td>set_gid</td>
<td>02000</td>
<td>S_ISGID</td>
<td>Set-group-ID on execution</td>
</tr>
<tr>
<td>sticky_bit</td>
<td>01000</td>
<td>S_ISVTX</td>
<td>Operating system dependent.</td>
</tr>
<tr>
<td>mask</td>
<td>07777</td>
<td>all</td>
<td>set_uid</td>
</tr>
</tbody>
</table>

29.11.9.5 Enum class perm_options

The enum class type perm_options is a bitmask type (16.4.2.2.4) that specifies bitmask constants used to control the semantics of permissions operations, with the meanings listed in Table 132. The bitmask constants are bitmask elements. In Table 132 perm denotes a value of type perms passed to permissions.

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>replace</td>
<td>permissions shall replace the file’s permission bits with perm</td>
</tr>
<tr>
<td>add</td>
<td>permissions shall replace the file’s permission bits with the bitwise OR of perm and the file’s current permission bits.</td>
</tr>
<tr>
<td>remove</td>
<td>permissions shall replace the file’s permission bits with the bitwise AND of the complement of perm and the file’s current permission bits.</td>
</tr>
<tr>
<td>nofollow</td>
<td>permissions shall change the permissions of a symbolic link itself rather than the permissions of the file the link resolves to.</td>
</tr>
</tbody>
</table>

29.11.9.6 Enum class directory_options

The enum class type directory_options is a bitmask type (16.4.2.2.4) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 133. The constant none represents the empty bitmask; every other constant in the table represents a distinct bitmask element.
Table 133: Enum class directory_options  

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>(Default) Skip directory symlinks, permission denied is an error.</td>
</tr>
<tr>
<td>follow_directory_symlink</td>
<td>Follow rather than skip directory symlinks.</td>
</tr>
<tr>
<td>skip_permission_denied</td>
<td>Skip directories that would otherwise result in permission denied.</td>
</tr>
</tbody>
</table>

29.11.10 Class file_status  

namespace std::filesystem {
  class file_status {
    public:
      // 29.11.10.1, constructors and destructor
      file_status() noexcept : file_status(file_type::none) {}
      explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;
      file_status(const file_status&) noexcept = default;
      file_status(file_status&&) noexcept = default;
      ~file_status();

      // assignments
      file_status& operator=(const file_status&) noexcept = default;
      file_status& operator=(file_status&&) noexcept = default;

      // 29.11.10.3, modifiers
      void type(file_type ft) noexcept;
      void permissions(perms prms) noexcept;

      // 29.11.10.2, observers
      file_type type() const noexcept;
      perms permissions() const noexcept;

      friend bool operator==(const file_status& lhs, const file_status& rhs) noexcept {
        return lhs.type() == rhs.type() && lhs.permissions() == rhs.permissions();
      }
  }
}

1 An object of type file_status stores information about the type and permissions of a file.

29.11.10.1 Constructors  

explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;
1 Postconditions: type() == ft and permissions() == prms.

29.11.10.2 Observers  

file_type type() const noexcept;
1 Returns: The value of type() specified by the postconditions of the most recent call to a constructor, operator=, or type(file_type) function.
perms permissions() const noexcept;
2 Returns: The value of permissions() specified by the postconditions of the most recent call to a constructor, operator=, or permissions(perms) function.

29.11.10.3 Modifiers  

void type(file_type ft) noexcept;
1 Postconditions: type() == ft.
void permissions(perms prms) noexcept;

Postconditions: permissions() == prms.

29.11.11 Class directory_entry

namespace std::filesystem {
    class directory_entry {
        public:
            // 29.11.11.1, constructors and destructor
            directory_entry() noexcept = default;
            directory_entry(const directory_entry&) = default;
            directory_entry(directory_entry&&) noexcept = default;
            explicit directory_entry(const filesystem::path& p);
            directory_entry(const filesystem::path& p, error_code& ec);
            ~directory_entry();

            // assignments
            directory_entry& operator=(const directory_entry&) = default;
            directory_entry& operator=(directory_entry&&) noexcept = default;

            // 29.11.11.2, modifiers
            void assign(const filesystem::path& p);
            void assign(const filesystem::path& p, error_code& ec);
            void replace_filename(const filesystem::path& p);
            void replace_filename(const filesystem::path& p, error_code& ec);
            void refresh();
            void refresh(error_code& ec) noexcept;

            // 29.11.11.3, observers
            const filesystem::path& path() const noexcept;
            operator const filesystem::path&() const noexcept;
            bool exists() const;
            bool exists(error_code& ec) const noexcept;
            bool is_block_file() const;
            bool is_block_file(error_code& ec) const noexcept;
            bool is_character_file() const;
            bool is_character_file(error_code& ec) const noexcept;
            bool is_directory() const;
            bool is_directory(error_code& ec) const noexcept;
            bool is_fifo() const;
            bool is_fifo(error_code& ec) const noexcept;
            bool is_other() const;
            bool is_other(error_code& ec) const noexcept;
            bool is_regular_file() const;
            bool is_regular_file(error_code& ec) const noexcept;
            bool is_socket() const;
            bool is_socket(error_code& ec) const noexcept;
            bool is_syalink() const;
            bool is_syalink(error_code& ec) const noexcept;
            uintmax_t file_size() const;
            uintmax_t file_size(error_code& ec) const noexcept;
            uintmax_t hard_link_count() const;
            uintmax_t hard_link_count(error_code& ec) const noexcept;
            file_time_type last_write_time() const;
            file_time_type last_write_time(error_code& ec) const noexcept;
            file_status status() const;
            file_status status(error_code& ec) const noexcept;
            file_status syalink_status() const;
            file_status syalink_status(error_code& ec) const noexcept;

bool operator==(const directory_entry& rhs) const noexcept;
strong_ordering operator<=>(const directory_entry& rhs) const noexcept;
private:
    filesystem::path pathobject;   // exposition only
friend class directory_iterator; // exposition only
};

A directory_entry object stores a path object and may store additional objects for file attributes such as
hard link count, status, symlink status, file size, and last write time.

Implementations should store such additional file attributes during directory iteration if their values are avail-
able and storing the values would allow the implementation to eliminate file system accesses by directory_-entry observer functions (29.11.14). Such stored file attribute values are said to be cached.

[Note: For purposes of exposition, class directory_iterator (29.11.12) is shown above as a friend of class directory_entry. Friendship allows the directory_iterator implementation to cache already available attribute values directly into a directory_entry object without the cost of an unneeded call to refresh(). — end note]

Example:
using namespace std::filesystem;

    // use possibly cached last write time to minimize disk accesses
    for (auto&& x : directory_iterator(".
        \{   std::cout << x.path() << " " << x.last_write_time() << std::endl;
    }    // call refresh() to refresh a stale cache
            for (auto&& x : directory_iterator(".
    {   lengthy_function(x.path());    // cache becomes stale
        x.refresh();
        std::cout << x.path() << " " << x.last_write_time() << std::endl;
    }

On implementations that do not cache the last write time, both loops will result in a potentially expensive
call to the std::filesystem::last_write_time function. On implementations that do cache the last write
time, the first loop will use the cached value and so will not result in a potentially expensive call to the
std::filesystem::last_write_time function. The code is portable to any implementation, regardless of
whether or not it employs caching. — end example]

29.11.11.1 Constructors

explicit directory_entry(const filesystem::path& p);
directory_entry(const filesystem::path& p, error_code& ec);

    Effects: Calls refresh() or refresh(ec), respectively.

    Postconditions: path() == p if no error occurs, otherwise path() == filesystem::path().

    Throws: As specified in 29.11.6.

29.11.11.2 Modifiers

void assign(const filesystem::path& p);
void assign(const filesystem::path& p, error_code& ec);

    Effects: Equivalent to pathobject = p, then refresh() or refresh(ec), respectively. If an error
ocurs, the values of any cached attributes are unspecified.

    Throws: As specified in 29.11.6.

void replace_filename(const filesystem::path& p);
void replace_filename(const filesystem::path& p, error_code& ec);

    Effects: Equivalent to pathobject.replace_filename(p), then refresh() or refresh(ec), respecti-
tively. If an error occurs, the values of any cached attributes are unspecified.

    Throws: As specified in 29.11.6.
void refresh();
void refresh(error_code& ec) noexcept;

4 Effects: Stores the current values of any cached attributes of the file p resolves to. If an error occurs, an error is reported (29.11.6) and the values of any cached attributes are unspecified.

5 Throws: As specified in 29.11.6.

6 [Note: Implementations of directory_iterator (29.11.12) are prohibited from directly or indirectly calling the refresh function since it must access the external file system, and the objective of caching is to avoid unnecessary file system accesses. — end note]

29.11.11.3 Observers [fs.dir.entry.obs]

1 Unqualified function names in the Returns: elements of the directory_entry observers described below refer to members of the std::filesystem namespace.

const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;

2 Returns: pathobject.

bool exists() const;
bool exists(error_code& ec) const noexcept;

3 Returns: exists(this->status()) or exists(this->status(ec)), respectively.

4 Throws: As specified in 29.11.6.

bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;

5 Returns: is_block_file(this->status()) or is_block_file(this->status(ec)), respectively.

6 Throws: As specified in 29.11.6.

bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;

7 Returns: is_character_file(this->status()) or is_character_file(this->status(ec)), respectively.

8 Throws: As specified in 29.11.6.

bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;

9 Returns: is_directory(this->status()) or is_directory(this->status(ec)), respectively.

10 Throws: As specified in 29.11.6.

bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;

11 Returns: is_fifo(this->status()) or is_fifo(this->status(ec)), respectively.

12 Throws: As specified in 29.11.6.

bool is_other() const;
bool is_other(error_code& ec) const noexcept;

13 Returns: is_other(this->status()) or is_other(this->status(ec)), respectively.

14 Throws: As specified in 29.11.6.

bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;

15 Returns: is_regular_file(this->status()) or is_regular_file(this->status(ec)), respectively.

16 Throws: As specified in 29.11.6.

bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;
\[
\text{Returns: } \text{is_socket(this->status()) or is_socket(this->status(ec)), respectively.}
\]
\textbf{Throws: } As specified in 29.11.6.

bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
\[
\text{Returns: } \text{is_symlink(this->symlink_status()) or is_symlink(this->symlink_status(ec)), respectively.}
\]
\textbf{Throws: } As specified in 29.11.6.

uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;
\[
\text{Returns: } \text{If cached, the file size attribute value. Otherwise, file_size(path()) or file_size(path(), ec), respectively.}
\]
\textbf{Throws: } As specified in 29.11.6.

uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;
\[
\text{Returns: } \text{If cached, the hard link count attribute value. Otherwise, hard_link_count(path()) or hard_link_count(path(), ec), respectively.}
\]
\textbf{Throws: } As specified in 29.11.6.

file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;
\[
\text{Returns: } \text{If cached, the last write time attribute value. Otherwise, last_write_time(path()) or last_write_time(path(), ec), respectively.}
\]
\textbf{Throws: } As specified in 29.11.6.

file_status status() const;
file_status status(error_code& ec) const noexcept;
\[
\text{Returns: } \text{If cached, the status attribute value. Otherwise, status(path()) or status(path(), ec), respectively.}
\]
\textbf{Throws: } As specified in 29.11.6.

file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;
\[
\text{Returns: } \text{If cached, the symlink status attribute value. Otherwise, symlink_status(path()) or symlink_status(path(), ec), respectively.}
\]
\textbf{Throws: } As specified in 29.11.6.

bool operator==(const directory_entry& rhs) const noexcept;
\[
\text{Returns: } \text{pathobject == rhs.pathobject.}
\]

strong_ordering operator<=>(const directory_entry& rhs) const noexcept;
\[
\text{Returns: } \text{pathobject <=> rhs.pathobject.}
\]

29.11.12 Class directory_iterator

An object of type directory_iterator provides an iterator for a sequence of directory_entry elements representing the path and any cached attribute values (29.11.11) for each file in a directory or in an implementation-defined directory-like file type. [Note: For iteration into sub-directories, see class recursive_directory_iterator (29.11.13). — end note]

namespace std::filesystem {
class directory_iterator {
  public:
    using iterator_category = input_iterator_tag;
    using value_type = directory_entry;

  29.11.12 Class directory_iterator

namespace std::filesystem {
class directory_iterator {
  public:
    using iterator_category = input_iterator_tag;
    using value_type = directory_entry;

```cpp
    bool is_socket(error_code& ec) const noexcept;
```

Returns: is_socket(this->status()) or is_socket(this->status(ec)), respectively.

Throws: As specified in 29.11.6.

bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;

Returns: is_symlink(this->symlink_status()) or is_symlink(this->symlink_status(ec)), respectively.

Throws: As specified in 29.11.6.

uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;

Returns: If cached, the file size attribute value. Otherwise, file_size(path()) or file_size(path(), ec), respectively.

Throws: As specified in 29.11.6.

uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;

Returns: If cached, the hard link count attribute value. Otherwise, hard_link_count(path()) or hard_link_count(path(), ec), respectively.

Throws: As specified in 29.11.6.

file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;

Returns: If cached, the last write time attribute value. Otherwise, last_write_time(path()) or last_write_time(path(), ec), respectively.

Throws: As specified in 29.11.6.

file_status status() const;
file_status status(error_code& ec) const noexcept;

Returns: If cached, the status attribute value. Otherwise, status(path()) or status(path(), ec), respectively.

Throws: As specified in 29.11.6.

file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;

Returns: If cached, the symlink status attribute value. Otherwise, symlink_status(path()) or symlink_status(path(), ec), respectively.

Throws: As specified in 29.11.6.

bool operator==(const directory_entry& rhs) const noexcept;

Returns: pathobject == rhs.pathobject.

strong_ordering operator<=>(const directory_entry& rhs) const noexcept;

Returns: pathobject <=> rhs.pathobject.
```
using difference_type  = ptrdiff_t;
using pointer        = const directory_entry*;
using reference      = const directory_entry&;

// 29.11.12.1, member functions
directory_iterator() noexcept;
edirected_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options,
                    error_code& ec);
directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;
~directory_iterator();
directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;
const directory_entry& operator*() const;
const directory_entry* operator->() const;
directory_iterator& operator++();
directory_iterator& increment(error_code& ec);

// other members as required by 23.3.5.2, input iterators
};
}
directory_iterator meets the Cpp17InputIterator requirements (23.3.5.2).

If an iterator of type directory_iterator reports an error or is advanced past the last directory element,
that iterator shall become equal to the end iterator value. The directory_iterator default constructor
shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end
condition.

The end iterator is not dereferenceable.

Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.

The result of calling the path() member of the directory_entry object obtained by dereferencing a
directory_iterator is a reference to a path object composed of the directory argument from which the
iterator was constructed with filename of the directory entry appended as if by operator/=.

Directory iteration shall not yield directory entries for the current (dot) and parent (dot-dot) directories.

The order of directory entries obtained by dereferencing successive increments of a directory_iterator is
unspecified.

Constructors and non-const directory_iterator member functions store the values of any cached attributes (29.11.11) in the directory_entry element returned by operator*(). directory_iterator member functions shall not directly or indirectly call any directory_entry refresh function. [Note: The exact mechanism for storing cached attribute values is not exposed to users. For exposition, class directory_iterator is shown in 29.11.11 as a friend of class directory_entry. — end note]

[Note: Programs performing directory iteration may wish to test if the path obtained by dereferencing a
directory iterator actually exists. It could be a symbolic link to a non-existent file. Programs recursively
walking directory trees for purposes of removing and renaming entries may wish to avoid following symbolic
links. — end note]

[Note: If a file is removed from or added to a directory after the construction of a directory_iterator for
the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an
iterator referencing the removed or added directory entry. See POSIX readdir_r. — end note]

29.11.12.1 Members

directory_iterator() noexcept;

Effects: Constructs the end iterator.
explicit directory_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options, error_code& ec);

Effects: For the directory that \( p \) resolves to, constructs an iterator for the first element in a sequence of directory_entry elements representing the files in the directory, if any; otherwise the end iterator. However, if

\[(\text{options} \& \text{directory_options::skip_permission_denied}) \neq \text{directory_options::none}\]

and construction encounters an error indicating that permission to access \( p \) is denied, constructs the end iterator and does not report an error.

Throws: As specified in 29.11.6.

[Note: To iterate over the current directory, use directory_iterator(".") rather than directory_iterator(""). — end note]

directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;

Postconditions: \*this has the original value of \( \text{rhs} \).

directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;

Effects: If \*this and \text{rhs} are the same object, the member has no effect.

Postconditions: \*this has the original value of \text{rhs}.

Returns: \*this.

directory_iterator& operator++();
directory_iterator& increment(error_code& ec);

Effects: As specified for the prefix increment operation of Input iterators (23.3.5.2).

Returns: \*this.

Throws: As specified in 29.11.6.

29.11.12.2 Non-member functions

These functions enable range access for directory_iterator.

directory_iterator begin(directory_iterator iter) noexcept;

Returns: \text{iter}.

directory_iterator end(const directory_iterator&) noexcept;

Returns: directory_iterator().

29.11.13 Class recursive_directory_iterator

An object of type recursive_directory_iterator provides an iterator for a sequence of directory_entry elements representing the files in a directory or in an implementation-defined directory-like file type, and its sub-directories.

namespace std::filesystem {

class recursive_directory_iterator {

public:

using iterator_category = input_iterator_tag;
using value_type = directory_entry;
using difference_type = ptrdiff_t;
using pointer = const directory_entry*;
using reference = const directory_entry&;

// 29.11.13.1, constructors and destructor
recursive_directory_iterator() noexcept;
explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);

} // namespace std::filesystem

}}}
recursive_directory_iterator(const path& p, directory_options options, error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);
recursive_directory_iterator(const recursive_directory_iterator& rhs);
recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
~recursive_directory_iterator();

// 29.11.13.1, observers
directory_options options() const;
int depth() const;
bool recursion_pending() const;

const directory_entry& operator*() const;
const directory_entry* operator->() const;

// 29.11.13.1, modifiers
recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);
recursive_directory_iterator& operator=(recursive_directory_iterator&& rhs) noexcept;
recursive_directory_iterator& operator++();
recursive_directory_iterator& increment(error_code& ec);

void pop();
void pop(error_code& ec);
void disable_recursion_pending();

// other members as required by 23.3.5.2, input iterators
};

2 Calling options, depth, recursion_pending, pop or disable_recursion_pending on an iterator that is not dereferenceable results in undefined behavior.

3 The behavior of a recursive_directory_iterator is the same as a directory_iterator unless otherwise specified.

4 [Note: If the directory structure being iterated over contains cycles then the end iterator may be unreachable. —end note]

29.11.13.1 Members

recursive_directory_iterator() noexcept;

1 Effects: Constructs the end iterator.

explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options, error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);

2 Effects: Constructs an iterator representing the first entry in the directory to which p resolves, if any; otherwise, the end iterator. However, if

(options & directory_options::skip_permission_denied) != directory_options::none

and construction encounters an error indicating that permission to access p is denied, constructs the end iterator and does not report an error.

3 Postconditions: options() == options for the signatures with a directory_options argument, otherwise options() == directory_options::none.

4 Throws: As specified in 29.11.6.

5 [Note: To iterate over the current directory, use recursive_directory_iterator(".") rather than recursive_directory_iterator(""). —end note]
[Note: By default, recursive_directory_iterator does not follow directory symlinks. To follow directory symlinks, specify options as directory_options::follow_directory_symlink. —end note]

recursive_directory_iterator(const recursive_directory_iterator& rhs);

Postconditions:

(7.1) options() == rhs.options()
(7.2) depth() == rhs.depth()
(7.3) recursion_pending() == rhs.recursion_pending()

recursive_directory_iterator(const recursive_directory_iterator& rhs) noexcept;

Postconditions: options(), depth(), and recursion_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion_pending(), respectively, had before the function call.

recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);

Effects: If *this and rhs are the same object, the member has no effect.

Postconditions:

(10.1) options() == rhs.options()
(10.2) depth() == rhs.depth()
(10.3) recursion_pending() == rhs.recursion_pending()

Returns: *this.

recursive_directory_iterator& operator=(recursive_directory_iterator& rhs) noexcept;

Effects: If *this and rhs are the same object, the member has no effect.

Postconditions: options(), depth(), and recursion_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion_pending(), respectively, had before the function call.

Returns: *this.

directory_options options() const;

Returns: The value of the argument passed to the constructor for the options parameter, if present, otherwise directory_options::none.

Throws: Nothing.

int depth() const;

Returns: The current depth of the directory tree being traversed. [Note: The initial directory is depth 0, its immediate subdirectories are depth 1, and so forth. —end note]

Throws: Nothing.

bool recursion_pending() const;

Returns: true if disable_recursion_pending() has not been called subsequent to the prior construction or increment operation, otherwise false.

Throws: Nothing.

recursive_directory_iterator& operator++();
recursive_directory_iterator& increment(error_code& ec);

Effects: As specified for the prefix increment operation of Input iterators (23.3.5.2), except that:

(21.1) If there are no more entries at the current depth, then if depth() != 0 iteration over the parent directory resumes; otherwise *this = recursive_directory_iterator().

(21.2) Otherwise if recursion_pending() && is_directory(*this) && (!is_symlink(*this) || options() & directory_options::follow_directory_symlink) != directory_options::none)

then either directory (*this)->path() is recursively iterated into or, if
and an error occurs indicating that permission to access directory (*this)->path() is denied, then directory (*this)->path() is treated as an empty directory and no error is reported.

Returns: *this.

Throws: As specified in 29.11.6.

void pop();
void pop(error_code& ec);

Effects: If depth() == 0, set *this to recursive_directory_iterator(). Otherwise, cease iteration of the directory currently being iterated over, and continue iteration over the parent directory.

Throws: As specified in 29.11.6.

Remarks: Any copies of the previous value of *this are no longer required to be dereferenceable nor to be in the domain of ==.

void disable_recursion_pending();

Postconditions: recursion_pending() == false.

[Note: disable_recursion_pending() is used to prevent unwanted recursion into a directory. — end note]

29.11.13.2 Non-member functions

These functions enable use of recursive_directory_iterator with range-based for statements.

recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;

Returns: iter.

recursive_directory_iterator end(const recursive_directory_iterator&) noexcept;

Returns: recursive_directory_iterator().

29.11.14 Filesystem operation functions

Filesystem operation functions query or modify files, including directories, in external storage.

[Note: Because hardware failures, network failures, file system races (29.11.2.3), and many other kinds of errors occur frequently in file system operations, users should be aware that any filesystem operation function, no matter how apparently innocuous, may encounter an error; see 29.11.6. — end note]

29.11.14.1 Absolute

path absolute(const path& p);
path absolute(const path& p, error_code& ec);

Effects: Composes an absolute path referencing the same file system location as p according to the operating system (29.11.2.2).

Returns: The composed path. The signature with argument ec returns path() if an error occurs.

[Note: For the returned path, rp, rp.is_absolute() is true unless an error occurs. — end note]

Throws: As specified in 29.11.6.

[Note: To resolve symlinks, or perform other sanitization which might require queries to secondary storage, such as hard disks, consider canonical (29.11.14.2). — end note]

[Note: Implementations are strongly encouraged to not query secondary storage, and not consider !exists(p) an error. — end note]

[Example: For POSIX-based operating systems, absolute(p) is simply current_path()/p. For Windows-based operating systems, absolute might have the same semantics as GetFullPathNameW. — end example]

29.11.14.2 Canonical

path canonical(const path& p);
path canonical(const path& p, error_code& ec);

**Effects:** Converts p to an absolute path that has no symbolic link, dot, or dot-dot elements in its path name in the generic format.

**Returns:** A path that refers to the same file system object as absolute(p). The signature with argument ec returns path() if an error occurs.

**Throws:** As specified in 29.11.6.

**Remarks:** !exists(p) is an error.

### 29.11.14.3 Copy

void copy(const path& from, const path& to);

**Effects:** Equivalent to copy(from, to, copy_options::none).

void copy(const path& from, const path& to, error_code& ec);

**Effects:** Equivalent to copy(from, to, copy_options::none, ec).

void copy(const path& from, const path& to, copy_options options);

void copy(const path& from, const path& to, copy_options options, error_code& ec);

**Preconditions:** At most one element from each option group (29.11.9.3) is set in options.

**Effects:** Before the first use of f and t:

1. If
   - (options & copy_options::create_symlinks) != copy_options::none ||
   - (options & copy_options::skip_symlinks) != copy_options::none
     then auto f = symlink_status(from) and if needed auto t = symlink_status(to).
2. Otherwise, if
   - (options & copy_options::copy_symlinks) != copy_options::none
     then auto f = symlink_status(from) and if needed auto t = status(to).
3. Otherwise, auto f = status(from) and if needed auto t = status(to).

**Effects are then as follows:**

4. If f.type() or t.type() is an implementation-defined file type (29.11.9.2), then the effects are implementation-defined.

5. Otherwise, an error is reported as specified in 29.11.6 if:
   - exists(f) is false, or
   - equivalent(from, to) is true, or
   - is_other(f) || is_other(t) is true, or
   - is_directory(f) && is_regular_file(t) is true.

6. Otherwise, if is_symlink(f), then:
   - If (options & copy_options::skip_symlinks) != copy_options::none then return.
   - Otherwise if
     - !exists(t) && (options & copy_options::copy_symlinks) != copy_options::none then copy_symlink(from, to).
   - Otherwise report an error as specified in 29.11.6.

7. Otherwise, if is_regular_file(f), then:
   - If (options & copy_options::directories_only) != copy_options::none, then return.
   - Otherwise, if (options & copy_options::create_symlinks) != copy_options::none, then create a symbolic link to the source file.
   - Otherwise, if (options & copy_options::create_hard_links) != copy_options::none, then create a hard link to the source file.
(4.7.4) Otherwise, if `is_directory(t)`, then `copy_file(from, to/from.filename(), options)`.

(4.7.5) Otherwise, `copy_file(from, to, options)`.

(4.8) Otherwise, if

```cpp
is_directory(f) &&
(options & copy_options::create_symlinks) != copy_options::none
```

then report an error with an `error_code` argument equal to `make_error_code(errc::is_a_directory)`.

(4.9) Otherwise, if

```cpp
is_directory(f) &&
((options & copy_options::recursive) != copy_options::none ||
 options == copy_options::none)
```

then:

(4.9.1) If `exists(t)` is `false`, then `create_directory(to, from)`.

(4.9.2) Then, iterate over the files in `from`, as if by

```cpp
for (const directory_entry& x : directory_iterator(from))
    copy(x.path(), to/x.path().filename(),
         options | copy_options::in-recursive-copy);
```

where `in-recursive-copy` is a bitmask element of `copy_options` that is not one of the elements in 29.11.9.3.

(4.10) Otherwise, for the signature with argument `ec`, `ec.clear()`.

(4.11) Otherwise, no effects.

5 **Throws:** As specified in 29.11.6.

6 **Remarks:** For the signature with argument `ec`, any library functions called by the implementation shall have an `error_code` argument if applicable.

7 [Example: Given this directory structure:

```
/dirl
  file1
  file2
  dir2
  file3
```

Calling `copy("/dirl", "/dirl")` would result in:

```
/dirl
  file1
  file2
  dir2
  file3
```

Alternatively, calling `copy("/dirl", "/dirl", copy_options::recursive)` would result in:

```
/dirl
  file1
  file2
  dir2
  file3
```
```
/dirl
  file1
  file2
  dir2
  file3
```

— end example]
29.11.14.4 Copy file

Returns: copy_file(from, to, copy_options::none) or
          copy_file(from, to, copy_options::none, ec), respectively.

Throws: As specified in 29.11.6.

Preconditions: At most one element from each option group (29.11.9.3) is set in options.

Effects: As follows:

(4.1) Report an error as specified in 29.11.6 if:

(4.1.1) is_regular_file(from) is false, or
(4.1.2) exists(to) is true and is_regular_file(to) is false, or
(4.1.3) exists(to) is true and equivalent(from, to) is true, or
(4.1.4) exists(to) is true and
          (options & (copy_options::skip_existing |
                     copy_options::overwrite_existing |
                     copy_options::update_existing)) == copy_options::none

(4.2) Otherwise, copy the contents and attributes of the file from resolves to, to the file to resolves to, if:

(4.2.1) exists(to) is false, or
(4.2.2) (options & copy_options::overwrite_existing) != copy_options::none, or
(4.2.3) (options & copy_options::update_existing) != copy_options::none and from is more recent than to, determined as if by use of the last_write_time function (29.11.14.25).

(4.3) Otherwise, no effects.

Returns: true if the from file was copied, otherwise false. The signature with argument ec returns false if an error occurs.

Throws: As specified in 29.11.6.

Complexity: At most one direct or indirect invocation of status(to).

29.11.14.5 Copy symlink

Effects: Equivalent to function(read_symlink(existing_symlink), new_symlink) or
          function(read_symlink(existing_symlink, ec), new_symlink, ec), respectively, where in each case function is create_symlink or create_directory_symlink as appropriate.

Throws: As specified in 29.11.6.

29.11.14.6 Create directories

Effects: Calls create_directory() for each element of p that does not exist.

Returns: true if a new directory was created for the directory p resolves to, otherwise false.

Throws: As specified in 29.11.6.

Complexity: $O(n)$ where $n$ is the number of elements of p.
29.11.4.7 Create directory

```cpp
bool create_directory(const path& p);
bool create_directory(const path& p, error_code& ec) noexcept;
```

**Effects:** Creates the directory `p` resolves to, as if by POSIX `mkdir` with a second argument of `static_cast<int>(perms::all)`. If `mkdir` fails because `p` resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

**Returns:** `true` if a new directory was created, otherwise `false`.

**Throws:** As specified in 29.11.6.

```cpp
bool create_directory(const path& p, const path& existing_p);
bool create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;
```

**Effects:** Creates the directory `p` resolves to, with attributes copied from directory `existing_p`. The set of attributes copied is operating system dependent. If `mkdir` fails because `p` resolves to an existing directory, no error is reported. Otherwise on failure an error is reported. [Note: For POSIX-based operating systems, the attributes are those copied by native API `stat(existing_p.c_str(), &attributes_stat)` followed by `mkdir(p.c_str(), attributes_stat.st_mode)`. For Windows-based operating systems, the attributes are those copied by native API `CreateDirectoryExW(existing_p.c_str(), p.c_str(), 0)`. —end note]

**Returns:** `true` if a new directory was created with attributes copied from directory `existing_p`, otherwise `false`.

**Throws:** As specified in 29.11.6.

29.11.14.8 Create directory symlink

```cpp
void create_directory_symlink(const path& to, const path& new_symlink);
void create_directory_symlink(const path& to, const path& new_symlink, error_code& ec) noexcept;
```

**Effects:** Establishes the postcondition, as if by POSIX `symlink()`.

**Postconditions:** `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

**Throws:** As specified in 29.11.6.

[Note: Some operating systems require symlink creation to identify that the link is to a directory. Portable code should use `create_directory_symlink()` to create directory symlinks rather than `create_symlink()` —end note]

[Note: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. —end note]

29.11.14.9 Create hard link

```cpp
void create_hard_link(const path& to, const path& new_hard_link);
void create_hard_link(const path& to, const path& new_hard_link, error_code& ec) noexcept;
```

**Effects:** Establishes the postcondition, as if by POSIX `link()`.

**Postconditions:**

(2.1) `exists(to) && exists(new_hard_link) && equivalent(to, new_hard_link)`

(2.2) The contents of the file or directory `to` resolves to are unchanged.

**Throws:** As specified in 29.11.6.

[Note: Some operating systems do not support hard links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some file systems limit the number of links per file. —end note]

29.11.14.10 Create symlink

```cpp
void create_symlink(const path& to, const path& new_symlink);
```
void create_symlink(const path& to, const path& new_symlink,  
    error_code& ec) noexcept;
1  Effects: Establishes the postcondition, as if by POSIX symlink().
2  Postconditions: new_symlink resolves to a symbolic link file that contains an unspecified representation
3  of to.
4  Throws: As specified in 29.11.6.
5  [Note: Some operating systems do not support symbolic links at all or support them only for regular
6  files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the
7  operating system. — end note]

29.11.14.11 Current path

path current_path();
path current_path(error_code& ec);
1  Returns: The absolute path of the current working directory, whose pathname in the native format is
2  obtained as if by POSIX getcwd(). The signature with argument ec returns path() if an error occurs.
3  Throws: As specified in 29.11.6.
4  Remarks: The current working directory is the directory, associated with the process, that is used as
5  the starting location in pathname resolution for relative paths.
6  [Note: The current_path() name was chosen to emphasize that the returned value is a path, not just
7  a single directory name. — end note]
8  [Note: The current path as returned by many operating systems is a dangerous global variable. It may
9  be changed unexpectedly by third-party or system library functions, or by another thread. — end note]

void current_path(const path& p);
void current_path(const path& p, error_code& ec) noexcept;
1  Effects: Establishes the postcondition, as if by POSIX chdir().
2  Postconditions: equivalent(p, current_path()).
3  Throws: As specified in 29.11.6.
4  [Note: The current path for many operating systems is a dangerous global state. It may be changed
5  unexpectedly by a third-party or system library functions, or by another thread. — end note]

29.11.14.12 Equivalent

bool equivalent(const path& p1, const path& p2);
bool equivalent(const path& p1, const path& p2, error_code& ec) noexcept;
1  Returns: true, if p1 and p2 resolve to the same file system entity, otherwise false. The signature with
2  argument ec returns false if an error occurs.
3  Two paths are considered to resolve to the same file system entity if two candidate entities reside on the
4  same device at the same location. [Note: On POSIX platforms, this is determined as if by the values of
5  the POSIX stat class, obtained as if by stat() for the two paths, having equal st_dev values and
6  equal st_ino values. — end note]
7  Remarks: !exists(p1) || !exists(p2) is an error.
8  Throws: As specified in 29.11.6.

29.11.14.13 Exists

bool exists(file_status s) noexcept;
1  Returns: status_known(s) && s.type() != file_type::not_found.

bool exists(const path& p);
bool exists(const path& p, error_code& ec) noexcept;
1  Let s be a file_status, determined as if by status(p) or status(p, ec), respectively.
2  Effects: The signature with argument ec calls ec.clear() if status_known(s).
Returns: `exists(s)`.

Throws: As specified in 29.11.6.

### 29.11.14.14 File size

```cpp
uintmax_t file_size(const path& p);
uintmax_t file_size(const path& p, error_code& ec) noexcept;
```

**Effects:** If `exists(p)` is `false`, an error is reported (29.11.6).

**Returns:**

1. If `is_regular_file(p)`, the size in bytes of the file `p` resolves to, determined as if by the value of the POSIX `stat` class member `st_size` obtained as if by POSIX `stat()`.
2. Otherwise, the result is implementation-defined.

The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

Throws: As specified in 29.11.6.

### 29.11.14.15 Hard link count

```cpp
uintmax_t hard_link_count(const path& p);
uintmax_t hard_link_count(const path& p, error_code& ec) noexcept;
```

**Returns:** The number of hard links for `p`. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

Throws: As specified in 29.11.6.

### 29.11.14.16 Is block file

```cpp
bool is_block_file(file_status s) noexcept;
bool is_block_file(const path& p);
bool is_block_file(const path& p, error_code& ec) noexcept;
```

**Returns:** `s.type() == file_type::block`.

The signature with argument `ec` returns `false` if an error occurs.

Throws: As specified in 29.11.6.

### 29.11.14.17 Is character file

```cpp
bool is_character_file(file_status s) noexcept;
bool is_character_file(const path& p);
bool is_character_file(const path& p, error_code& ec) noexcept;
```

**Returns:** `s.type() == file_type::character`.

The signature with argument `ec` returns `false` if an error occurs.

Throws: As specified in 29.11.6.

### 29.11.14.18 Is directory

```cpp
bool is_directory(file_status s) noexcept;
bool is_directory(const path& p);
bool is_directory(const path& p, error_code& ec) noexcept;
```

**Returns:** `s.type() == file_type::directory`.

The signature with argument `ec` returns `false` if an error occurs.

Throws: As specified in 29.11.6.
29.11.14.19  **Is empty**  

bool is_empty(const path& p);
bool is_empty(const path& p, error_code& ec);

1  **Effects:**
(1.1) Determine `file_status` `s`, as if by `status(p)` or `status(p, ec)`, respectively.
(1.2) For the signature with argument `ec`, return false if an error occurred.
(1.3) Otherwise, if `is_directory(s):
(1.3.1) Create a variable `itr`, as if by `directory_iterator itr(p)` or `directory_iterator itr(p, ec)`, respectively.
(1.3.2) For the signature with argument `ec`, return false if an error occurred.
(1.3.3) Otherwise, return `itr == directory_iterator()`.
(1.4) Otherwise:
(1.4.1) Determine `uintmax_t sz`, as if by `file_size(p)` or `file_size(p, ec)`, respectively.
(1.4.2) For the signature with argument `ec`, return false if an error occurred.
(1.4.3) Otherwise, return `sz == 0`.

2  **Throws:** As specified in 29.11.6.

29.11.14.20  **Is fifo**

bool is_fifo(file_status s) noexcept;

1  **Returns:** `s.type()` == `file_type::fifo`.

bool is_fifo(const path& p);
bool is_fifo(const path& p, error_code& ec) noexcept;

1  **Returns:** `is_fifo(status(p))` or `is_fifo(status(p, ec))`, respectively. The signature with argument `ec` returns false if an error occurs.

2  **Throws:** As specified in 29.11.6.

29.11.14.21  **Is other**

bool is_other(file_status s) noexcept;

1  **Returns:** `exists(s) && !is_regular_file(s) && !is_directory(s) && !is_symlink(s)`.

bool is_other(const path& p);
bool is_other(const path& p, error_code& ec) noexcept;

1  **Returns:** `is_other(status(p))` or `is_other(status(p, ec))`, respectively. The signature with argument `ec` returns false if an error occurs.

2  **Throws:** As specified in 29.11.6.

29.11.14.22  **Is regular file**

bool is_regular_file(file_status s) noexcept;

1  **Returns:** `s.type()` == `file_type::regular`.

bool is_regular_file(const path& p);

1  **Returns:** `is_regular_file(status(p))`.

2  **Throws:** `filesystem_error` if `status(p)` would throw `filesystem_error`.

bool is_regular_file(const path& p, error_code& ec) noexcept;

4  **Effects:** Sets `ec` as if by `status(p, ec)`. [Note: `file_type::none`, `file_type::not_found` and `file_type::unknown` cases set `ec` to error values. To distinguish between cases, call the `status` function directly. — end note]

5  **Returns:** `is_regular_file(status(p, ec))`. Returns false if an error occurs.
29.11.14.23  Is socket

bool is_socket(file_status s) noexcept;

Returns: s.type() == file_type::socket.

bool is_socket(const path& p);
bool is_socket(const path& p, error_code& ec) noexcept;

Returns: is_socket(status(p)) or is_socket(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 29.11.6.

29.11.14.24  Is symlink

bool is_symlink(file_status s) noexcept;

Returns: s.type() == file_type::symlink.

bool is_symlink(const path& p);
bool is_symlink(const path& p, error_code& ec) noexcept;

Returns: is_symlink(symlink_status(p)) or is_symlink(symlink_status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 29.11.6.

29.11.14.25  Last write time

file_time_type last_write_time(const path& p);
file_time_type last_write_time(const path& p, error_code& ec) noexcept;

Returns: The time of last data modification of p, determined as if by the value of the POSIX stat class member st_mtime obtained as if by POSIX stat(). The signature with argument ec returns file_time_type::min() if an error occurs.

Throws: As specified in 29.11.6.

void last_write_time(const path& p, file_time_type new_time);
void last_write_time(const path& p, file_time_type new_time,
error_code& ec) noexcept;

Effects: Sets the time of last data modification of the file resolved to by p to new_time, as if by POSIX futimens().

Throws: As specified in 29.11.6.

[Note: A postcondition of last_write_time(p) == new_time is not specified since it might not hold for file systems with coarse time granularity. —end note]

29.11.14.26  Permissions

void permissions(const path& p, perms prms, perm_options opts=perm_options::replace);
void permissions(const path& p, perms prms, error_code& ec) noexcept;
void permissions(const path& p, perms prms, perm_options opts, error_code& ec);

Preconditions: Exactly one of the perm_options constants replace, add, or remove is present in opts.

Remarks: The second signature behaves as if it had an additional parameter perm_options opts with an argument of perm_options::replace.

Effects: Applies the action specified by opts to the file p resolves to, or to file p itself if p is a symbolic link and perm_options::nofollow is set in opts. The action is applied as if by POSIX fchmodat().

[Note: Conceptually permissions are viewed as bits, but the actual implementation may use some other mechanism. —end note]

Throws: As specified in 29.11.6.

29.11.14.27  Proximate

path proximate(const path& p, error_code& ec);

Returns: proximate(p, current_path(), ec).
2  Throws: As specified in 29.11.6.

path proximate(const path& p, const path& base = current_path());
path proximate(const path& p, const path& base, error_code& ec);

3  Returns: For the first form:
weakly_canonical(p).lexically_proximate(weakly_canonical(base));
For the second form:
weakly_canonical(p, ec).lexically_proximate(weakly_canonical(base, ec));
or path() at the first error occurrence, if any.

4  Throws: As specified in 29.11.6.

29.11.14.28 Read symlink  [fs.op.read.symlink]

path read_symlink(const path& p);
path read_symlink(const path& p, error_code& ec);

1  Returns: If p resolves to a symbolic link, a path object containing the contents of that symbolic link.
The signature with argument ec returns path() if an error occurs.

2  Throws: As specified in 29.11.6. [Note: It is an error if p does not resolve to a symbolic link. — end note]

29.11.14.29 Relative  [fs.op.relative]

path relative(const path& p, error_code& ec);

1  Returns: relative(p, current_path(), ec).

2  Throws: As specified in 29.11.6.

path relative(const path& p, const path& base = current_path());
path relative(const path& p, const path& base, error_code& ec);

3  Returns: For the first form:
weakly_canonical(p).lexically_relative(weakly_canonical(base));
For the second form:
weakly_canonical(p, ec).lexically_relative(weakly_canonical(base, ec));
or path() at the first error occurrence, if any.

4  Throws: As specified in 29.11.6.

29.11.14.30 Remove  [fs.op.remove]

bool remove(const path& p);
bool remove(const path& p, error_code& ec) noexcept;

1  Effects: If exists(symlink_status(p, ec)), the file p is removed as if by POSIX remove(). [Note: A symbolic link is itself removed, rather than the file it resolves to. — end note]

2  Postconditions: exists(symlink_status(p)) is false.

3  Returns: false if p did not exist, otherwise true. The signature with argument ec returns false if an error occurs.

4  Throws: As specified in 29.11.6.

29.11.14.31 Remove all  [fs.op.remove.all]

uintmax_t remove_all(const path& p);
uintmax_t remove_all(const path& p, error_code& ec);

1  Effects: Recursively deletes the contents of p if it exists, then deletes file p itself, as if by POSIX remove(). [Note: A symbolic link is itself removed, rather than the file it resolves to. — end note]

2  Postconditions: exists(symlink_status(p)) is false.

3  Returns: The number of files removed. The signature with argument ec returns static_cast<uintmax_t>(-1) if an error occurs.
Throws: As specified in 29.11.6.

29.11.14.32 Rename

void rename(const path& old_p, const path& new_p);
void rename(const path& old_p, const path& new_p, error_code& ec) noexcept;

Effects: Renames old_p to new_p, as if by POSIX rename().

[Note:
(1.1) If old_p and new_p resolve to the same existing file, no action is taken.
(1.2) Otherwise, the rename may include the following effects:
(1.2.1) if new_p resolves to an existing non-directory file, new_p is removed; otherwise,
(1.2.2) if new_p resolves to an existing directory, new_p is removed if empty on POSIX compliant
operating systems but may be an error on other operating systems.
A symbolic link is itself renamed, rather than the file it resolves to. — end note]

Throws: As specified in 29.11.6.

29.11.14.33 Resize file

void resize_file(const path& p, uintmax_t new_size);
void resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;

Effects: Causes the size that would be returned by file_size(p) to be equal to new_size, as if by
POSIX truncate().

Throws: As specified in 29.11.6.

29.11.14.34 Space

space_info space(const path& p);
space_info space(const path& p, error_code& ec) noexcept;

Returns: An object of type space_info. The value of the space_info object is determined as if
by using POSIX statvfs to obtain a POSIX struct statvfs, and then multiplying its f_blocks,
f_bfree, and f_bavail members by its f_frsize member, and assigning the results to the capacity,
free, and available members respectively. Any members for which the value cannot be determined
shall be set to static_cast<uintmax_t>(-1). For the signature with argument ec, all members are
set to static_cast<uintmax_t>(-1) if an error occurs.

Throws: As specified in 29.11.6.

Remarks: The value of member space_info::available is operating system dependent. [Note:
available may be less than free. — end note]

29.11.14.35 Status

file_status status(const path& p);

Effects: As if:

error_code ec;
file_status result = status(p, ec);
if (result.type() == file_type::none)
    throw filesystem_error(implementation-supplied-message, p, ec);
return result;

Returns: See above.

Throws: filesystem_error. [Note: result values of file_status(file_type::not_found) and
file_status(file_type::unknown) are not considered failures and do not cause an exception to be
thrown. — end note]

file_status status(const path& p, error_code& ec) noexcept;

Effects: If possible, determines the attributes of the file p resolves to, as if by using POSIX stat() to
obtain a POSIX struct stat. If, during attribute determination, the underlying file system API
reports an error, sets ec to indicate the specific error reported. Otherwise, ec.clear(). [Note: This
allows users to inspect the specifics of underlying API errors even when the value returned by \texttt{status()} is not \texttt{file_status(file_type::none)}. — end note]

Let \texttt{prms} denote the result of \texttt{(m & perms::mask)}, where \(m\) is determined as if by converting the \texttt{st_mode} member of the obtained \texttt{struct stat} to the type \texttt{perms}.

\textbf{Returns:}

\begin{enumerate}[label=(6.1),itemsep=0pt]
  \item If \texttt{ec} != \texttt{error_code():}
    \begin{enumerate}[label=(6.1.1),itemsep=0pt]
      \item If the specific error indicates that \(p\) cannot be resolved because some element of the path does not exist, returns \texttt{file_status(file_type::not_found)}.
      \item Otherwise, if the specific error indicates that \(p\) can be resolved but the attributes cannot be determined, returns \texttt{file_status(file_type::unknown)}.
      \item Otherwise, returns \texttt{file_status(file_type::none)}.
    \end{enumerate}

[Note: These semantics distinguish between \(p\) being known not to exist, \(p\) existing but not being able to determine its attributes, and there being an error that prevents even knowing if \(p\) exists. These distinctions are important to some use cases. — end note]

\item Otherwise,
  \begin{enumerate}[label=(6.2),itemsep=0pt]
    \item If the attributes indicate a regular file, as if by POSIX \texttt{S_ISREG}, returns \texttt{file_status(file_type::regular, prms)}. [Note: \texttt{file_type::regular} implies appropriate \texttt{<fstream>} operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of \texttt{file_type::regular} does not necessarily imply \texttt{<fstream>} operations would fail on a directory. — end note]
    \item Otherwise, if the attributes indicate a directory, as if by POSIX \texttt{S_ISDIR}, returns \texttt{file_status(file_type::directory, prms)}. [Note: \texttt{file_type::directory} implies that calling \texttt{directory_iterator(p)} would succeed. — end note]
    \item Otherwise, if the attributes indicate a block special file, as if by POSIX \texttt{S_ISBLK}, returns \texttt{file_status(file_type::block, prms)}.
    \item Otherwise, if the attributes indicate a character special file, as if by POSIX \texttt{S_ISCHR}, returns \texttt{file_status(file_type::character, prms)}.
    \item Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX \texttt{S_ISFIFO}, returns \texttt{file_status(file_type::fifo, prms)}.
    \item Otherwise, if the attributes indicate a socket, as if by POSIX \texttt{S_ISSOCK}, returns \texttt{file_status(file_type::socket, prms)}.
    \item Otherwise, if the attributes indicate an implementation-defined file type (29.11.9.2), returns \texttt{file_status(file_type::A, prms)}, where \(A\) is the constant for the implementation-defined file type.
    \item Otherwise, returns \texttt{file_status(file_type::unknown, prms)}.
  \end{enumerate}

\begin{enumerate}[label=(6.2.8),itemsep=0pt]
\end{enumerate}

\textit{Remarks:} If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

29.11.14.36 \textbf{Status known} \[fs.op.status.known\]

\begin{verbatim}
bool status_known(file_status s) noexcept;
\end{verbatim}

\textit{Returns:} \texttt{s.type()} != \texttt{file_type::none}.

29.11.14.37 \textbf{Symlink status} \[fs.op.symlink.status\]

\begin{verbatim}
file_status symlink_status(const path& p);
file_status symlink_status(const path& p, error_code& ec) noexcept;
\end{verbatim}

\textit{Effects:} Same as \texttt{status()}, above, except that the attributes of \(p\) are determined as if by using POSIX \texttt{lstat()} to obtain a POSIX \texttt{struct stat}.

Let \texttt{prms} denote the result of \texttt{(m & perms::mask)}, where \(m\) is determined as if by converting the \texttt{st_mode} member of the obtained \texttt{struct stat} to the type \texttt{perms}.

\footnotesize
\hspace{1em}$\S$ 29.11.14.37 ©ISO/IEC 2020 – All rights reserved 1481
Returns: Same as status(), above, except that if the attributes indicate a symbolic link, as if by POSIX S_ISLNK, returns file_status(file_type::symlink, prms). The signature with argument ec returns file_status(file_type::none) if an error occurs.

Remarks: Pathname resolution terminates if p names a symbolic link.

Throws: As specified in 29.11.6.

29.11.14.38 Temporary directory path

path temp_directory_path();
path temp_directory_path(error_code& ec);

Let p be an unspecified directory path suitable for temporary files.

Effects: If exists(p) is false or is_directory(p) is false, an error is reported (29.11.6).

Returns: The path p. The signature with argument ec returns path() if an error occurs.

Throws: As specified in 29.11.6.

[Example: For POSIX-based operating systems, an implementation might return the path supplied by the first environment variable found in the list TMPDIR, TMP, TEMP, TEMPDIR, or if none of these are found, "/tmp".
For Windows-based operating systems, an implementation might return the path reported by the Windows GetTempPath API function. — end example]

29.11.14.39 Weakly canonical

path weakly_canonical(const path& p);
path weakly_canonical(const path& p, error_code& ec);

Returns: p with symlinks resolved and the result normalized (29.11.7.1).

Effects: Using status(p) or status(p, ec), respectively, to determine existence, return a path composed by operator/= from the result of calling canonical() with a path argument composed of the leading elements of p that exist, if any, followed by the elements of p that do not exist, if any. For the first form, canonical() is called without an error_code argument. For the second form, canonical() is called with ec as an error_code argument, and path() is returned at the first error occurrence, if any.

Postconditions: The returned path is in normal form (29.11.7.1).

Remarks: Implementations should avoid unnecessary normalization such as when canonical has already been called on the entirety of p.

Throws: As specified in 29.11.6.

The contents and meaning of the header `<cinttypes>` are the same as the C standard library header `<inttypes.h>`, with the following changes:

1. The header `<cinttypes>` includes the header `<cstdint>` (17.4.1) instead of `<stdint.h>`, and
2. if and only if the type `intmax_t` designates an extended integer type (6.8.1), the following function signatures are added:
   ```c
   intmax_t abs(intmax_t);
   imaxdiv_t div(intmax_t, intmax_t);
   ```

which shall have the same semantics as the function signatures `intmax_t imaxabs(intmax_t)` and `imaxdiv_t imaxdiv(intmax_t, intmax_t)`, respectively.

30 Regular expressions library [re]

30.1 General [re.general]

1 This Clause describes components that C++ programs may use to perform operations involving regular expression matching and searching.

2 The following subclauses describe a basic regular expression class template and its traits that can handle char-like (21.1) template arguments, two specializations of this class template that handle sequences of char and wchar_t, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as summarized in Table 134.

30.2 Definitions [re.def]

1 The following definitions shall apply to this Clause:

30.2.1 collating element [defns.regex.collating.element]
a sequence of one or more characters within the current locale that collate as if they were a single character.

30.2.2 finite state machine [defns.regex.finite.state.machine]
an unspecified data structure that is used to represent a regular expression, and which permits efficient matches against the regular expression to be obtained.

30.2.3 format specifier [defns.regex.formatspecifier]
a sequence of one or more characters that is to be replaced with some part of a regular expression match.

30.2.4 matched [defns.regex.matched]
a sequence of zero or more characters that is matched by a regular expression when the characters in the sequence correspond to a sequence of characters defined by the pattern.

30.2.5 primary equivalence class [defns.regex.primary.equivalence.class]
a set of one or more characters which share the same primary sort key: that is the sort key weighting that depends only upon character shape, and not accents, case, or locale specific tailorings.

§ 30.2.5 ©ISO/IEC 2020 – All rights reserved 1486
30.2.6  \[\text{[defs.regex.regular.expression]}\]
regular expression
a pattern that selects specific strings from a set of character strings.

30.2.7  \[\text{[defs.regex.subexpression]}\]
sub-expression
a subset of a regular expression that has been marked by parenthesis.

30.3  \[\text{[re.req]}\]
Requirements

1 This subclause defines requirements on classes representing regular expression traits.  \[Note: The class template regex_traits, defined in 30.7, meets these requirements. \textendnote{]}

2 The class template basic_regex, defined in 30.8, needs a set of related types and functions to complete the definition of its semantics. These types and functions are provided as a set of member typedef-names and functions in the template parameter traits used by the basic_regex class template. This subclause defines the semantics of these members.

3 To specialize class template basic_regex for a character container CharT and its related regular expression traits class Traits, use basic_regex<CharT, Traits>.

4 In Table 135 X denotes a traits class defining types and functions for the character container type charT; u is an object of type X; v is an object of type const X; p is a value of type const charT*; I1 and I2 are input iterators (23.3.5.2); F1 and F2 are forward iterators (23.3.5.4); c is a value of type const charT; s is an object of type X::string_type; cs is an object of type const X::string_type; b is a value of type bool; I is a value of type int; cl is an object of type X::char_class_type, and loc is an object of type X::locale_type.

<tr>
<td>v.transform(F1, F2)</td>
<td>X::string_type</td>
<td>Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then v.transform(G1, G2) &lt; v.transform(H1, H2).</td>
<td></td>
</tr>
</tbody>
</table>
### Table 135: Regular expression traits class requirements (continued)

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>v.transform_primary(F1, F2)</td>
<td>X::string_type</td>
<td>Returns a sort key for the character sequence designated by the iterator range ([F1, F2)) such that if the character sequence ([G1, G2)) sorts before the character sequence ([H1, H2)) when character case is not considered then (v).transform_primary(G1, G2) &lt; v.transform_primary(H1, H2).</td>
</tr>
<tr>
<td>v.lookup_collatename(F1, F2)</td>
<td>X::string_type</td>
<td>Returns a sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range ([F1, F2)). Returns an empty string if the character sequence is not a valid collating element.</td>
</tr>
<tr>
<td>v.lookup_classname(F1, F2, b)</td>
<td>X::char_class_type</td>
<td>Converts the character sequence designated by the iterator range ([F1, F2)) into a value of a bitmask type that can subsequently be passed to isctype. Values returned from lookup_classname can be bitwise OR’ed together; the resulting value represents membership in either of the corresponding character classes. If (b) is true, the returned bitmask is suitable for matching characters without regard to their case. Returns 0 if the character sequence is not the name of a character class recognized by (X). The value returned shall be independent of the case of the characters in the sequence.</td>
</tr>
<tr>
<td>v.isctype(c, cl)</td>
<td>bool</td>
<td>Returns true if character (c) is a member of one of the character classes designated by (cl), false otherwise.</td>
</tr>
<tr>
<td>v.value(c, I)</td>
<td>int</td>
<td>Returns the value represented by the digit (c) in base (I) if the character (c) is a valid digit in base (I); otherwise returns -1. [Note: The value of (I) will only be 8, 10, or 16. —end note]</td>
</tr>
<tr>
<td>u.imbue(loc)</td>
<td>X::locale_type</td>
<td>Imbues (u) with the locale (loc) and returns the previous locale used by (u) if any.</td>
</tr>
<tr>
<td>v.getloc()</td>
<td>X::locale_type</td>
<td>Returns the current locale used by (v), if any.</td>
</tr>
</tbody>
</table>

\[Note: Class template regex_traits meets the requirements for a regular expression traits class when it is specialized for char or wchar_t. This class template is described in the header <regex>, and is described in 30.7. —end note\]

}

30.5 Namespace std::regex_constants

The namespace std::regex_constants holds symbolic constants used by the regular expression library. This namespace provides three types, syntax_option_type, match_flag_type, and error_type, along with several constants of these types.

30.5.1 Bitmask type syntax_option_type

namespace std::regex_constants {
    using syntax_option_type = T1;
    inline constexpr syntax_option_type icase = unspecified;
    inline constexpr syntax_option_type nosubs = unspecified;
    inline constexpr syntax_option_type optimize = unspecified;
    inline constexpr syntax_option_type collate = unspecified;
    inline constexpr syntax_option_type ECMAScript = unspecified;
    inline constexpr syntax_option_type basic = unspecified;
    inline constexpr syntax_option_type extended = unspecified;
    inline constexpr syntax_option_type awk = unspecified;
    inline constexpr syntax_option_type grep = unspecified;
    inline constexpr syntax_option_type egrep = unspecified;
    inline constexpr syntax_option_type multiline = unspecified;
}

The type syntax_option_type is an implementation-defined bitmask type (16.4.2.2.4). Setting its elements has the effects listed in Table 136. A valid value of type syntax_option_type shall have at most one of the grammar elements ECMAScript, basic, extended, awk, grep, egrep, set. If no grammar element is set, the default grammar is ECMAScript.

30.5.2 Bitmask type match_flag_type

namespace std::regex_constants {
    using match_flag_type = T2;
    inline constexpr match_flag_type match_default = {};
    inline constexpr match_flag_type match_not_bol = unspecified;
    inline constexpr match_flag_type match_not_eol = unspecified;
    inline constexpr match_flag_type match_not_bow = unspecified;
    inline constexpr match_flag_type match_not_eow = unspecified;
}

</tbody>
</table>

```cpp
inline constexpr match_flag_type match_any = unspecified;
inline constexpr match_flag_type match_not_null = unspecified;
inline constexpr match_flag_type match_continuous = unspecified;
inline constexpr match_flag_type match_prev_avail = unspecified;
inline constexpr match_flag_type format_default = {};
inline constexpr match_flag_type format_sed = unspecified;
inline constexpr match_flag_type format_no_copy = unspecified;
inline constexpr match_flag_type format_first_only = unspecified;
```

1 The type `match_flag_type` is an implementation-defined bitmask type (16.4.2.2.4). The constants of that type, except for `match_default` and `format_default`, are bitmask elements. The `match_default` and `format_default` constants are empty bitmasks. Matching a regular expression against a sequence of characters `[first, last)` proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in Table 137 for any bitmask elements set.

Table 137: `regex_constants::match_flag_type` effects when obtaining a match against a character container sequence `[first, last)`.  

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td>expression shall not match <code>[first, first)</code>.</td>
</tr>
</tbody>
</table>
Table 137: regex_constants::match_flag_type effects when obtaining a match against a character container sequence \([first, last)\). (continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>match_not_eol</td>
<td>The last character in the sequence ([first, last)) shall be treated as though it is not at the end of a line, so the character &quot;$&quot; in the regular expression shall not match ([last, last)).</td>
</tr>
<tr>
<td>match_not_bow</td>
<td>The expression (&quot;\b&quot; shall not match the sub-sequence ([first, first)).</td>
</tr>
<tr>
<td>match_not_eow</td>
<td>The expression (&quot;\b&quot; shall not match the sub-sequence ([last, last)).</td>
</tr>
<tr>
<td>match_any</td>
<td>If more than one match is possible then any match is an acceptable result.</td>
</tr>
<tr>
<td>match_not_null</td>
<td>The expression shall not match an empty sequence.</td>
</tr>
<tr>
<td>match_continuous</td>
<td>The expression shall only match a sub-sequence that begins at (first).</td>
</tr>
</tbody>
</table>
| match_prev_avail         | --first is a valid iterator position. When this flag is set the flags match_-
                                not_bol and match_not_bow shall be ignored by the regular expression
                                algorithms (30.11) and iterators (30.12).                                |
| format_default           | When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the ECMAScript replace function in ECMA-262, part 15.5.4.11 String.prototype.replace. In addition, during search and replace operations all non-overlapping occurrences of the regular expression shall be located and replaced, and sections of the input that did not match the expression shall be copied unchanged to the output string. |
| format_sed               | When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the sed utility in POSIX. |
| format_no_copy           | During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string. |
| format_first_only        | When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced. |

30.5.3 Implementation-defined error_type

```cpp
namespace std::regex_constants {
    using error_type = T3;
    inline constexpr error_type error_collate = unspecified;
    inline constexpr error_type error_ctype = unspecified;
    inline constexpr error_type error_escape = unspecified;
    inline constexpr error_type error_backref = unspecified;
    inline constexpr error_type error_brack = unspecified;
    inline constexpr error_type error_paren = unspecified;
    inline constexpr error_type error_brace = unspecified;
    inline constexpr error_type error_badbrace = unspecified;
    inline constexpr error_type error_range = unspecified;
    inline constexpr error_type error_space = unspecified;
    inline constexpr error_type error_badrepeat = unspecified;
    inline constexpr error_type error_complexity = unspecified;
    inline constexpr error_type error_stack = unspecified;
}
```

1 The type `error_type` is an implementation-defined enumerated type (16.4.2.2.3). Values of type `error_type` represent the error conditions described in Table 138:

Table 138: error_type values in the C locale

<table>
<thead>
<tr>
<th>Value</th>
<th>Error condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_collate</td>
<td>The expression contained an invalid collating element name.</td>
</tr>
<tr>
<td>error_ctype</td>
<td>The expression contained an invalid character class name.</td>
</tr>
<tr>
<td>error_escape</td>
<td>The expression contained an invalid escaped character, or a trailing escape.</td>
</tr>
<tr>
<td>error_backref</td>
<td>The expression contained an invalid back reference.</td>
</tr>
<tr>
<td>error_brack</td>
<td>The expression contained mismatched [ and ].</td>
</tr>
<tr>
<td>error_paren</td>
<td>The expression contained mismatched ( and ).</td>
</tr>
</tbody>
</table>
Table 138: `error_type` values in the C locale (continued)

<table>
<thead>
<tr>
<th>Value</th>
<th>Error condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_brace</td>
<td>The expression contained mismatched { and } expression.</td>
</tr>
<tr>
<td>error_badbrace</td>
<td>The expression contained an invalid range in a {} expression.</td>
</tr>
<tr>
<td>error_range</td>
<td>The expression contained an invalid character range, such as [b-a] in most encodings.</td>
</tr>
<tr>
<td>error_space</td>
<td>There was insufficient memory to convert the expression into a finite state machine.</td>
</tr>
<tr>
<td>error_badrepeat</td>
<td>One of *?+{ was not preceded by a valid regular expression.</td>
</tr>
<tr>
<td>error_complexity</td>
<td>The complexity of an attempted match against a regular expression exceeded a pre-set level.</td>
</tr>
<tr>
<td>error_stack</td>
<td>There was insufficient memory to determine whether the regular expression could match the specified character sequence.</td>
</tr>
</tbody>
</table>

30.6 Class `regex_error` [re.badexp]

```cpp
class regex_error : public runtime_error {
public:
  explicit regex_error(regex_constants::error_type ecode);
  regex_constants::error_type code() const;
};
```

1 The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.

```cpp
regex_error(regex_constants::error_type ecode);
```

2 Postconditions: `ecode == code()`.

```cpp
regex_constants::error_type code() const;
```

3 Returns: The error code that was passed to the constructor.

30.7 Class template `regex_traits` [re.traits]

```cpp
namespace std {
  template<class charT>
  struct regex_traits {
    using char_type = charT;
    using string_type = basic_string<char_type>;
    using locale_type = locale;
    using char_class_type = bitmask_type;
    regex_traits();
    static size_t length(const char_type* p);
    charT translate(charT c) const;
    charT translate_nocase(charT c) const;
    template<class ForwardIterator>
    string_type transform(ForwardIterator first, ForwardIterator last) const;
    template<class ForwardIterator>
    string_type transform_primary(ForwardIterator first, ForwardIterator last) const;
    template<class ForwardIterator>
    string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
    template<class ForwardIterator>
    char_class_type lookup_classname(ForwardIterator first, ForwardIterator last) const;
    bool isctype(charT c, char_class_type f) const;
    int value(charT ch, int radix) const;
    locale_type imbue(locale_type l);
    locale_type getloc() const;
  }
};
```
The specializations `regex_traits<char>` and `regex_traits<wchar_t>` meet the requirements for a regular expression traits class (30.3).

```cpp
using char_class_type = bitmask_type;
```

The type `char_class_type` is used to represent a character classification and is capable of holding an implementation specific set returned by `lookup_classname`.

```cpp
static size_t length(const char_type* p);
```

Returns: `char_traits<charT>::length(p)`.

```cpp
charT translate(charT c) const;
```

Returns: `c`.

```cpp
charT translate_nocase(charT c) const;
```

Returns: `use_facet<ctype<charT>>(getloc()).tolower(c)`.

```cpp
template<class ForwardIterator>
string_type transform(ForwardIterator first, ForwardIterator last) const;
```

Effects: As if by:

```cpp
string_type str(first, last);
return use_facet<collate<charT>>(getloc()).transform(str.data(), str.data() + str.length());
```

```cpp
template<class ForwardIterator>
string_type transform_primary(ForwardIterator first, ForwardIterator last) const;
```

Effects: If `typeid(use_facet<collate<charT>>) == typeid(collate_byname<charT>)` and the form of the sort key returned by `collate_byname<charT>::transform(first, last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

```cpp
template<class ForwardIterator>
string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
```

Returns: A sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range `[first, last)`. Returns an empty string if the character sequence is not a valid collating element.

```cpp
template<class ForwardIterator>
char_class_type lookup_classname(
    ForwardIterator first, ForwardIterator last,
    bool icase = false) const;
```

Returns: An unspecified value that represents the character classification named by the character sequence designated by the iterator range `[first, last)`. If the parameter `icase` is `true` then the returned mask identifies the character classification without regard to the case of the characters being matched, otherwise it does honor the case of the characters being matched. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns `char_class_type()`.

Remarks: For `regex_traits<char>`, at least the narrow character names in Table 139 shall be recognized. For `regex_traits<wchar_t>`, at least the wide character names in Table 139 shall be recognized.

```cpp
bool isctype(charT c, char_class_type f) const;
```

Effects: Determines if the character `c` is a member of the character classification represented by `f`.

Returns: Given the following function declaration:

```cpp
// for exposition only
template<class C>
ctype_base::mask convert(typename regex_traits<C>::char_class_type f);
```

For example, if the parameter `icase` is `true` then `[:lower:]` is the same as `[:alpha:]`.

\[325\]
that returns a value in which each \texttt{ctype\_base::mask} value corresponding to a value in \texttt{f} named in Table \ref{table:ctype} is set, then the result is determined as if by:

\begin{verbatim}
ctype_base::mask m = convert<char>(f);
const ctype<char>& ct = use_facet<ctype<char>>(getloc());
if (ct.is(m, c)) {
    return true;
} else if (c == ct.widen('_')) {
    charT w[1] = { ct.widen('w') };  
    char_class_type x = lookup_classname(w, w+1);
    return (f&x) == x;
} else {
    return false;
}
\end{verbatim}

\begin{example}
regex_traits<char> t;
string d("d");
string u("upper");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(d.begin(), d.end());
f |= t.lookup_classname(u.begin(), u.end());
ctype_base::mask m = convert<char>(f);  // m == ctype_base::digit|ctype_base::upper
\end{example}

\begin{verbatim}
regex_traits<char> t;
string w("w");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(w.begin(), w.end());
t.isctype('A', f);  // returns true
t.isctype('B', f);  // returns true
t.isctype('C', f);  // returns false
\end{verbatim}

\begin{verbatim}
int value(charT ch, int radix) const;
\end{verbatim}

\textbf{Preconditions:} The value of \texttt{radix} is 8, 10, or 16.

\textbf{Returns:} The value represented by the digit \texttt{ch} in base \texttt{radix} if the character \texttt{ch} is a valid digit in base \texttt{radix}; otherwise returns -1.

\begin{verbatim}
locale_type imbue(locale_type loc);
\end{verbatim}

\textbf{Effects:} Imbues \texttt{this} with a copy of the locale \texttt{loc}. [\textit{Note:} Calling \texttt{imbue} with a different locale than the one currently in use invalidates all cached data held by \texttt{*this}. — end note]

\textbf{Returns:} If no locale has been previously imbued then a copy of the global locale in effect at the time of construction of \texttt{*this}, otherwise a copy of the last argument passed to \texttt{imbue}.

\textbf{Postconditions:} \texttt{getloc()} == \texttt{loc}.

\begin{verbatim}
locale_type getloc() const;
\end{verbatim}

\textbf{Returns:} If no locale has been imbued then a copy of the global locale in effect at the time of construction of \texttt{*this}, otherwise a copy of the last argument passed to \texttt{imbue}.

\section{Class template \texttt{basic\_regex}}

For a char-like type \texttt{charT}, specializations of class template \texttt{basic\_regex} represent regular expressions constructed from character sequences of \texttt{charT} characters. In the rest of 30.8, \texttt{charT} denotes a given char-like type. Storage for a regular expression is allocated and freed as necessary by the member functions of class \texttt{basic\_regex}.

Objects of type specialization of \texttt{basic\_regex} are responsible for converting the sequence of \texttt{charT} objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions. [\textit{Note:} Implementations will typically declare some function templates as friends of \texttt{basic\_regex} to achieve this. — end note]

The functions described in this Clause report errors by throwing exceptions of type \texttt{regex\_error}.

30.8.1 Constructors

basic_regex();
Postconditions: *this does not match any character sequence.

explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);
Preconditions: [p, p + char_traits<charT>::length(p)) is a valid range.
Effects: The object’s internal finite state machine is constructed from the regular expression contained
in the sequence of characters [p, p + char_traits<charT>::length(p)), and interpreted according
to the flags f.
Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
within the expression.
Throws: regex_error if [p, p + char_traits<charT>::length(p)) is not a valid regular expression.

basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
Preconditions: [p, p + len] is a valid range.
Effects: The object’s internal finite state machine is constructed from the regular expression contained
in the sequence of characters [p, p + len), and interpreted according the flags specified in f.
Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
within the expression.
Throws: regex_error if [p, p + len] is not a valid regular expression.

§ 30.8.1 ©ISO/IEC 2020 – All rights reserved 1499
basic_regex(const basic_regex& e);

Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex(basic_regex&& e) noexcept;

Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(), respectively, had before construction.

template<class ST, class SA>
explicit basic_regex(const basic_string<charT, ST, SA>& s, flag_type f = regex_constants::ECMAScript);

Effects: The object’s internal finite state machine is constructed from the regular expression contained in the string s, and interpreted according to the flags specified in f.

Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.

Throws: regex_error if s is not a valid regular expression.

template<class ForwardIterator>
basic_regex(ForwardIterator first, ForwardIterator last, flag_type f = regex_constants::ECMAScript);

Effects: The object’s internal finite state machine is constructed from the regular expression contained in the sequence of characters [first, last), and interpreted according to the flags specified in f.

Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.

Throws: regex_error if the sequence [first, last) is not a valid regular expression.

basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);

Effects: Same as basic_regex(il.begin(), il.end(), f).

30.8.2 Assignment

basic_regex& operator=(const basic_regex& e);

Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex& operator=(basic_regex&& e) noexcept;

Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(), respectively, had before assignment. e is in a valid state with unspecified value.

basic_regex& operator=(const charT* p);

Effects: Equivalent to: return assign(p);

basic_regex& operator=(initializer_list<charT> il);

Effects: Equivalent to: return assign(il.begin(), il.end());

template<class ST, class SA>
basic_regex& operator=(const basic_string<charT, ST, SA>& s);

Effects: Equivalent to: return assign(s);

basic_regex& assign(const basic_regex& e);

Effects: Equivalent to: return *this = e;

basic_regex& assign(basic_regex&& e) noexcept;

Effects: Equivalent to: return *this = std::move(e);

basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);

Effects: Equivalent to: return assign(string_type(p), f);

basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);

Effects: Equivalent to: return assign(string_type(p, len), f);
template<class ST, class SA>
  basic_regex& assign(const basic_string<charT, ST, SA>& s,
                     flag_type f = regex_constants::ECMAScript);

Returns: *this.

Effects: Assigns the regular expression contained in the string s, interpreted according the flags specified in f. If an exception is thrown, *this is unchanged.

Postconditions: If no exception is thrown, flags() returns f and mark_count() returns the number of marked sub-expressions within the expression.

Throws: regex_error if s is not a valid regular expression.

template<class InputIterator>
  basic_regex& assign(InputIterator first, InputIterator last,
                     flag_type f = regex_constants::ECMAScript);

Effects: Equivalent to: return assign(string_type(first, last), f);

basic_regex& assign(initializer_list<charT> il,
                    flag_type f = regex_constants::ECMAScript);

Effects: Equivalent to: return assign(il.begin(), il.end(), f);

30.8.3 Constant operations

unsigned mark_count() const;

Effects: Returns the number of marked sub-expressions within the regular expression.

flag_type flags() const;

Effects: Returns a copy of the regular expression syntax flags that were passed to the object’s constructor or to the last call to assign.

30.8.4 Locale

locale_type imbue(locale_type loc);

Effects: Returns the result of traits_inst.imbue(loc) where traits_inst is a (default-initialized) instance of the template type argument traits stored within the object. After a call to imbue the basic_regex object does not match any character sequence.

locale_type getloc() const;

Effects: Returns the result of traits_inst.getloc() where traits_inst is a (default-initialized) instance of the template parameter traits stored within the object.

30.8.5 Swap

void swap(basic_regex& e);

Effects: Swaps the contents of the two regular expressions.

Postconditions: *this contains the regular expression that was in e, e contains the regular expression that was in *this.

Complexity: Constant time.

30.8.6 Non-member functions

template<class charT, class traits>
  void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);

Effects: Calls lhs.swap(rhs).

30.9 Class template sub_match

Class template sub_match denotes the sequence of characters matched by a particular marked sub-expression.
namespace std {
    template<class BidirectionalIterator>
    class sub_match : public pair<BidirectionalIterator, BidirectionalIterator> {
    public:
        using value_type = typename iterator_traits<BidirectionalIterator>::value_type;
        using difference_type = typename iterator_traits<BidirectionalIterator>::difference_type;
        using iterator = BidirectionalIterator;
        using string_type = basic_string<value_type>;
        bool matched;

        constexpr sub_match();

        difference_type length() const;
        operator string_type() const;
        string_type str() const;
        int compare(const sub_match& s) const;
        int compare(const string_type& s) const;
        int compare(const value_type* s) const;
    };
}

30.9.1 Members

constexpr sub_match();

Effects: Value-initializes the pair base class subobject and the member matched.

difference_type length() const;

Returns: matched ? distance(first, second) : 0.

operator string_type() const;

Returns: matched ? string_type(first, second) : string_type().

string_type str() const;

Returns: matched ? string_type(first, second) : string_type().

int compare(const sub_match& s) const;

Returns: str().compare(s.str()).

int compare(const string_type& s) const;

Returns: str().compare(s).

int compare(const value_type* s) const;

Returns: str().compare(s).

30.9.2 Non-member operators

Let SM-CAT(I) be

compare_three_way_result_t<basic_string<typename iterator_traits<I>::value_type>>

template<class BiIter>
    bool operator==(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

Returns: lhs.compare(rhs) == 0.

template<class BiIter>
    auto operator<=>(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <=> 0).
template<class BiIter, class ST, class SA>
bool operator==(const sub_match<BiIter>& lhs, const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);

Returns:
  lhs.compare(typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())) == 0

template<class BiIter, class ST, class SA>
auto operator<=>(const sub_match<BiIter>& lhs, const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);

Returns:
  static_cast<SM-CAT(BiIter)>(lhs.compare(
    typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())
    <=> 0
  )

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs, const typename iterator_traits<BiIter>::value_type* rhs);

Returns: lhs.compare(rhs) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs, const typename iterator_traits<BiIter>::value_type* rhs);

Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <=> 0).

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs, const typename iterator_traits<BiIter>::value_type& rhs);

Returns: lhs.compare(typename sub_match<BiIter>::string_type(1, rhs)) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs, const typename iterator_traits<BiIter>::value_type& rhs);

Returns:
  static_cast<SM-CAT(BiIter)>(lhs.compare(
    typename sub_match<BiIter>::string_type(1, rhs)
    <=> 0
  )

template<class charT, class ST, class BiIter>
basic_ostream<charT, ST>& operator<<(basic_ostream<charT, ST>&& os, const sub_match<BiIter>& m);

Returns: os << m.str().

30.10 Class template match_results

Class template match_results denotes a collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template match_results.

The class template match_results meets the requirements of an allocator-aware container and of a sequence container (22.2.1, 22.2.3) except that only copy assignment, move assignment, and operations defined for const-qualified sequence containers are supported and that the semantics of comparison functions are different from those required for a container.

A default-constructed match_results object has no fully established result state. A match result is ready when, as a consequence of a completed regular expression match modifying such an object, its result state becomes fully established. The effects of calling most member functions from a match_results object that is not ready are undefined.
The `sub_match` object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the `sub_match` member `matched` is always `true`. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to `true`, and members `first` and `second` denote the range of characters `[first, second)` which formed that match. Otherwise `matched` is `false`, and members `first` and `second` point to the end of the sequence that was searched. [Note: The `sub_match` objects representing different sub-expressions that did not participate in a regular expression match need not be distinct. — end note]

namespace std {

    template<class BidirectionalIterator,
             class Allocator = allocator<sub_match<BidirectionalIterator>>> 
    class match_results {
    public:
        using value_type = sub_match<BidirectionalIterator>;
        using const_reference = const value_type&;
        using reference = value_type&;
        using const_iterator = implementation-defined;
        using iterator = const_iterator;
        using difference_type =
            typename iterator_traits<BidirectionalIterator>::difference_type;
        using size_type =
            typename allocator_traits<Allocator>::size_type;
        using allocator_type = Allocator;
        using char_type =
            typename iterator_traits<BidirectionalIterator>::value_type;
        using string_type = basic_string<char_type>;

        // 30.10.1, construct/copy/destroy
        match_results() : match_results(Allocator()) {}
        explicit match_results(const Allocator&);
        match_results(const match_results& m);
        match_results(match_results&& m) noexcept;
        match_results& operator=(const match_results& m);
        match_results& operator=(match_results&& m);
        ~match_results();

        // 30.10.2, state
        bool ready() const;

        // 30.10.3, size
        size_type size() const;
        size_type max_size() const;
        [[nodiscard]] bool empty() const;

        // 30.10.4, element access
        difference_type length(size_type sub = 0) const;
        difference_type position(size_type sub = 0) const;
        string_type str(size_type sub = 0) const;
        const_reference operator[](size_type n) const;
        const_reference prefix() const;
        const_reference suffix() const;
        const_iterator begin() const;
        const_iterator end() const;
        const_iterator cbegin() const;
        const_iterator cend() const;

        // 30.10.5, format
        template<class OutputIter>
        OutputIter
            format(OutputIter out,
                   const char_type* fmt_first, const char_type* fmt_last,
                   regex_constants::match_flag_type flags = regex_constants::format_default) const;
    }
template<class OutputIter, class ST, class SA>
  OutputIter
  format(OutputIter out,
      const basic_string<char_type, ST, SA>& fmt,
      regex_constants::match_flag_type flags = regex_constants::format_default) const;

template<class ST, class SA>
  basic_string<char_type, ST, SA>
  format(const basic_string<char_type, ST, SA>& fmt, 
      regex_constants::match_flag_type flags = regex_constants::format_default) const;

string_type
  format(const char_type* fmt, 
      regex_constants::match_flag_type flags = regex_constants::format_default) const;

// 30.10.6, allocator
allocator_type get_allocator() const;

// 30.10.7, swap
void swap(match_results& that);
};

30.10.1 Constructors

explicit match_results(const Allocator& a);

Postconditions: ready() returns false, size() returns 0.
match_results(match_results&& m) noexcept;

Effects: The stored Allocator value is move constructed from m.get_allocator().
Postconditions: As specified in Table 140.

match_results& operator=(const match_results& m);
Postconditions: As specified in Table 140.

match_results& operator=(match_results&& m);
Postconditions: As specified in Table 140.

Table 140: match_results assignment operator effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ready()</td>
<td>m.ready()</td>
</tr>
<tr>
<td>size()</td>
<td>m.size()</td>

<td>m.position(n) for all integers n &lt; m.size()</td>
</tr>
</tbody>
</table>

30.10.2 State

bool ready() const;

Returns: true if *this has a fully established result state, otherwise false.

30.10.3 Size

size_type size() const;

Returns: One plus the number of marked sub-expressions in the regular expression that was matched 
if *this represents the result of a successful match. Otherwise returns 0. [Note: The state of a 
match_results object can be modified only by passing that object to regex_match or regex_search. 

§ 30.10.3 ©ISO/IEC 2020 – All rights reserved
Subclauses 30.11.2 and 30.11.3 specify the effects of those algorithms on their match_results arguments. —end note

size_type max_size() const;

Returns: The maximum number of sub_match elements that can be stored in *this.

[discard] bool empty() const;

Returns: size() == 0.

30.10.4 Element access  [re.results.acc]

difference_type length(size_type sub = 0) const;

Preconditions: ready() == true.

Returns: (*this)[sub].length().

difference_type position(size_type sub = 0) const;

Preconditions: ready() == true.

Returns: The distance from the start of the target sequence to (*this)[sub].first.

string_type str(size_type sub = 0) const;

Preconditions: ready() == true.

Returns: string_type((*this)[sub]).

const_reference operator[](size_type n) const;

Preconditions: ready() == true.

Returns: A reference to the sub_match object representing the character sequence that matched marked sub-expression n. If n == 0 then returns a reference to a sub_match object representing the character sequence that matched the whole regular expression. If n >= size() then returns a sub_match object representing an unmatched sub-expression.

const_reference prefix() const;

Preconditions: ready() == true.

Returns: A reference to the sub_match object representing the character sequence from the start of the string being matched/searched to the start of the match found.

const_reference suffix() const;

Preconditions: ready() == true.

Returns: A reference to the sub_match object representing the character sequence from the end of the match found to the end of the string being matched/searched.

const_iterator begin() const;
const_iterator cbegin() const;

Returns: A starting iterator that enumerates over all the sub-expressions stored in *this.

const_iterator end() const;
const_iterator cend() const;

Returns: A terminating iterator that enumerates over all the sub-expressions stored in *this.

30.10.5 Formatting  [re.results.form]

template<class OutputIter>
OutputIter format(
    OutputIter out,
    const char_type* fmt_first, const char_type* fmt_last,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;

Preconditions: ready() == true and OutputIter meets the requirements for a Cpp17OutputIterator (23.3.5.3).
Effects: Copies the character sequence \([\text{fmt first}, \text{fmt last})\) to OutputIter \(\text{out}\). Replaces each format specifier or escape sequence in the copied range with either the character(s) it represents or the sequence of characters within \(*\text{this}\) to which it refers. The bitmasks specified in \(\text{flags}\) determine which format specifiers and escape sequences are recognized.

Returns: \(\text{out}\).

\[
\text{template<class OutputIter, class ST, class SA>}
\text{OutputIter format(}
\text{OutputIter out,}
\text{const basic_string<char_type, ST, SA>& fmt,}
\text{regex_constants::match_flag_type flags = regex_constants::format_default) const;}
\]

Effects: Equivalent to:

\[
\text{return format(out, fmt.data(), fmt.data() + fmt.size(), flags);}\]

\[
\text{template<class ST, class SA>}
\text{basic_string<char_type, ST, SA> format(}
\text{const basic_string<char_type, ST, SA>& fmt,}
\text{regex_constants::match_flag_type flags = regex_constants::format_default) const;}
\]

Preconditions: \(\text{ready()} == \text{true}\).

Effects: Constructs an empty string \(\text{result}\) of type \(\text{basic_string<char_type, ST, SA>}\) and calls:

\[
\text{format(back_inserter(result), fmt, flags);}\]

Returns: \(\text{result}\).

\[
\text{string_type format(}
\text{const char_type* fmt,}
\text{regex_constants::match_flag_type flags = regex_constants::format_default) const;}
\]

Preconditions: \(\text{ready()} == \text{true}\).

Effects: Constructs an empty string \(\text{result}\) of type \(\text{string_type}\) and calls:

\[
\text{format(back_inserter(result), fmt, fmt + char_traits<char_type>::length(fmt), flags);}\]

Returns: \(\text{result}\).

## 30.10.6 Allocator

\[\text{allocator_type get_allocator()} \text{const;}_i\]

Returns: A copy of the Allocator that was passed to the object’s constructor or, if that allocator has been replaced, a copy of the most recent replacement.

## 30.10.7 Swap

\[\text{void swap(match_results& that);}\]

Effects: Swaps the contents of the two sequences.

Postconditions: \(*\text{this}\) contains the sequence of matched sub-expressions that were in \(\text{that}\), \(\text{that}\) contains the sequence of matched sub-expressions that were in \(*\text{this}\).

Complexity: Constant time.

\[
\text{template<class BidirectionalIterator, class Allocator>}
\text{void swap(match_results<BidirectionalIterator, Allocator>& m1,}
\text{match_results<BidirectionalIterator, Allocator>& m2);}\]

Effects: As if by \(\text{m1.swap(m2)}\).

## 30.10.8 Non-member functions

\[\text{template<class BidirectionalIterator, class Allocator>}
\text{bool operator==((const match_results<BidirectionalIterator, Allocator>& m1,}
\text{const match_results<BidirectionalIterator, Allocator>& m2);}\]

Returns: \(\text{true}\) if neither match result is ready, \(\text{false}\) if one match result is ready and the other is not. If both match results are ready, returns \(\text{true}\) only if:
ISO/IEC JTC1 SC22 WG21 N4860

(1.1) \text{m1.empty()} \&\& \text{m2.empty()}, or
(1.2) \text{!m1.empty()} \&\& \text{!m2.empty()}, and the following conditions are satisfied:
(1.2.1) \text{m1.prefix()} == \text{m2.prefix()},
(1.2.2) \text{m1.size()} == \text{m2.size()} \&\& \text{equal(m1.begin(), m1.end(), m2.begin())}, and
(1.2.3) \text{m1.suffix()} == \text{m2.suffix()}.

[Note: The algorithm \text{equal} is defined in Clause 25. — end note]

30.11 Regular expression algorithms

30.11.1 Exceptions

The algorithms described in subclause 30.11 may throw an exception of type \text{regex_error}. If such an exception \( e \) is thrown, \( e.\text{code()} \) shall return either \text{regex_constants::error_complexity} or \text{regex_constants::error_stack}.

30.11.2 \text{regex_match}

\begin{verbatim}
template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
                 match_results<BidirectionalIterator, Allocator>& m,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags = regex_constants::match_default);
\end{verbatim}

1 Preconditions: \text{BidirectionalIterator} meets the \text{Cpp17BidirectionalIterator} requirements (23.3.5.5).

2 Effects: Determines whether there is a match between the regular expression \( e \), and all of the character sequence \([\text{first, last})\]. The parameter \( \text{flags} \) is used to control how the expression is matched against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns \text{true} if such a match exists, \text{false} otherwise. [Example:

\begin{verbatim}
std::regex re("Get|GetValue");
std::cmatch m;
regex_search("GetValue", m, re); \quad // returns true, and m[0] contains "Get"
regex_match("GetValue", m, re); \quad // returns true, and m[0] contains "GetValue"
regex_search("GetValues", m, re); \quad // returns true, and m[0] contains "Get"
regex_match("GetValues", m, re); \quad // returns false
\end{verbatim}

— end example]

3 Postconditions: \text{m.ready()} == \text{true} in all cases. If the function returns \text{false}, then the effect on parameter \( m \) is unspecified except that \text{m.size()} returns 0 and \text{m.empty()} returns \text{true}. Otherwise the effects on parameter \( m \) are given in Table 141.

Table 141: Effects of \text{regex_match} algorithm

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>\text{m.size()}</td>
<td>( 1 + e.\text{mark_count()} )</td>

<tr>
<td>\text{m[0].first}</td>
<td>\text{first}</td>
</tr>
<tr>
<td>\text{m[0].second}</td>
<td>\text{last}</td>
</tr>
<tr>
<td>\text{m[0].matched}</td>
<td>\text{true}</td>
</tr>
<tr>
<td>\text{m[n].first}</td>
<td>For all integers ( 0 &lt; n &lt; m.\text{size()} ), the start of the sequence that matched sub-expression ( n ). Alternatively, if sub-expression ( n ) did not participate in the match, then \text{last}.</td>
</tr>
</tbody>
</table>

§ 30.11.2 ©ISO/IEC 2020 – All rights reserved 1508
Table 141: Effects of `regex_match` algorithm (continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
</table>
| `m[n].second` | For all integers \(0 < n < m\).size(), the end of the sequence that matched sub-expression \(n\). Alternatively, if sub-expression \(n\) did not participate in the match, then `last`.
| `m[n].matched` | For all integers \(0 < n < m\).size(), `true` if sub-expression \(n\) participated in the match, `false` otherwise. |

```
template<class BidirectionalIterator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Effects:** Behaves “as if” by constructing an instance of `match_results<BidirectionalIterator>` `what`, and then returning the result of `regex_match(first, last, what, e, flags)`.

```
template<class charT, class Allocator, class traits>
bool regex_match(const charT* str,
match_results<const charT*, Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(str, str + char_traits<charT>::length(str), m, e, flags)`.  

```
template<class ST, class SA, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
match_results<typename basic_string<charT, ST, SA>::const_iterator, Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(s.begin(), s.end(), m, e, flags)`.

```
template<class charT, class traits>
bool regex_match(const charT* str,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(str, str + char_traits<charT>::length(str), e, flags)`.

```
template<class ST, class SA, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(s.begin(), s.end(), e, flags)`.

### 30.11.3 `regex_search` [re.alg.search]

```
template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
match_results<BidirectionalIterator, Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Preconditions:** `BidirectionalIterator` meets the `Cpp17BidirectionalIterator` requirements (23.3.5.5).

**Effects:** Determines whether there is some sub-sequence within `[first, last)` that matches the regular expression `e`. The parameter `flags` is used to control how the expression is matched against the character sequence. Returns `true` if such a sequence exists, `false` otherwise.

**Postconditions:** `m.ready() == true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns 0 and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in Table 142.

</table>

```
template<class charT, class Allocator, class traits>
bool regex_search(const charT* str, match_results<const charT*, Allocator>& m, const basic_regex<charT, traits>& e, regex_constants::match_flag_type flags = regex_constants::match_default);
```
4 Returns: \(\text{regex}\_\text{search}(\text{str}, \text{str} + \text{char}\_\text{traits}\\:\:\text{length}(\text{str}), \text{m}, \text{e}, \text{flags}).\)

```
template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s, match_results<typename basic_string<charT, ST, SA>::const_iterator, Allocator>& m, const basic_regex<charT, traits>& e, regex_constants::match_flag_type flags = regex_constants::match_default);
```
5 Returns: \(\text{regex}\_\text{search}(\text{s}\.\text{begin}(), \text{s}\.\text{end}(), \text{m}, \text{e}, \text{flags}).\)

```
template<class BidirectionalIterator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last, const basic_regex<charT, traits>& e, regex_constants::match_flag_type flags = regex_constants::match_default);
```
6 Effects: Behaves “as if” by constructing an object what of type match_results<BidirectionalIterator> and returning regex_search(first, last, what, e, flags).

```
template<class charT, class traits>
bool regex_search(const charT* str, const basic_regex<charT, traits>& e, regex_constants::match_flag_type flags = regex_constants::match_default);
```
7 Returns: \(\text{regex}\_\text{search}(\text{str}, \text{str} + \text{char}\_\text{traits}\\:\:\text{length}(\text{str}), \text{e}, \text{flags}).\)

```
template<class ST, class SA, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s, const basic_regex<charT, traits>& e, regex_constants::match_flag_type flags = regex_constants::match_default);
```
8 Returns: \(\text{regex}\_\text{search}(\text{s}\.\text{begin}(), \text{s}\.\text{end}(), \text{e}, \text{flags}).\)
30.11.4 *regex_replace*  

```cpp
template<class OutputIterator, class BidirectionalIterator,  
        class traits, class charT, class ST, class SA>
OutputIterator  
    regex_replace(OutputIterator out,  
                  BidirectionalIterator first, BidirectionalIterator last,  
                  const basic_regex<charT, traits>& e,  
                  const basic_string<charT, ST, SA>& fmt,  
                  regex_constants::match_flag_type flags = regex_constants::match_default);  
```

**Effects:** Constructs a *regex_iterator* object `i` as if by

```cpp
regex_iterator<BidirectionalIterator, charT, traits> i(first, last, e, flags)  
```

and uses `i` to enumerate through all of the matches `m` of type `match_results<BidirectionalIterator>` that occur within the sequence `[first, last)`. If no such matches are found and `!(flags & regex_constants::format_no_copy)`, then calls

```cpp
out = copy(first, last, out)  
```

If any matches are found then, for each such match:

1. If `!(flags & regex_constants::format_no_copy)`, calls
   ```cpp
   out = copy(m.prefix().first, m.prefix().second, out)  
   ```
2. Then calls
   ```cpp
   out = m.format(out, fmt, flags)  
   ```
   for the first form of the function and
   ```cpp
   out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)  
   ```
   for the second.

Finally, if such a match is found and `!(flags & regex_constants::format_first_only)`, calls

```cpp
out = copy(last_m.suffix().first, last_m.suffix().second, out)  
```
where `last_m` is a copy of the last match found. If `flags & regex_constants::format_first_only` is nonzero, then only the first match found is replaced.

**Returns:** `out`.

```cpp
template<class traits, class charT, class ST, class SA, class FST, class FSA>
basic_string<charT, ST, SA>  
    regex_replace(const basic_string<charT, ST, SA>& s,  
                  const basic_regex<charT, traits>& e,  
                  const basic_string<charT, FST, FSA>& fmt,  
                  regex_constants::match_flag_type flags = regex_constants::match_default);  
```

**Effects:** Constructs an empty string `result` of type `basic_string<charT, ST, SA>` and calls:

```cpp
regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags);  
```

**Returns:** `result`.

```cpp
template<class traits, class charT, class ST, class SA>
basic_string<charT>  
    regex_replace(const charT* s,  
                  const basic_regex<charT, traits>& e,  
                  const charT* fmt,  
                  regex_constants::match_flag_type flags = regex_constants::match_default);  
```

**Effects:** Constructs an empty string `result` of type `basic_string<charT, ST, SA>` and calls:

```cpp
regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags);  
```
const basic_regex<charT, traits>& e,
const basic_string<charT, ST, SA>& fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);

Effects: Constructs an empty string result of type basic_string<charT> and calls:
regex_replace(back_inserter(result), s, s + char_traits<charT>::length(s), e, fmt, flags);

Returns: result.

30.12 Regular expression iterators

30.12.1 Class template regex_iterator

The class template regex_iterator is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A regex_iterator uses regex_search to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time operator++ is used, the iterator finds and stores a value of match_results<BidirectionalIterator>. If the end of the sequence is reached (regex_search returns false), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of operator* on an end-of-sequence iterator is not defined. For any other iterator value a const match_results<BidirectionalIterator>& is returned. The result of operator-> on an end-of-sequence iterator is not defined. For any other iterator value a const match_results<BidirectionalIterator>* is returned. It is impossible to store things into regex_iterators. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

namespace std {
    template<class BidirectionalIterator,
             class charT = typename iterator_traits<BidirectionalIterator>::value_type,
             class traits = regex_traits<charT>>
    class regex_iterator {
        public:
            using regex_type = basic_regex<charT, traits>;
            using iterator_category = forward_iterator_tag;
            using value_type = match_results<BidirectionalIterator>;
            using difference_type = ptrdiff_t;
            using pointer = const value_type*;
            using reference = const value_type&;

            regex_iterator();
            regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type& re,
                           regex_constants::match_flag_type m = regex_constants::match_default);
            regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type&&, regex_constants::match_flag_type = regex_constants::match_default) = delete;
            regex_iterator(const regex_iterator&);
            regex_iterator& operator=(const regex_iterator&);
            bool operator==(const regex_iterator& const);
            const value_type& operator*() const;
            const value_type* operator->() const;
            regex_iterator& operator++();
            regex_iterator operator++(int);

        private:
            BidirectionalIterator begin; // exposition only
            BidirectionalIterator end; // exposition only
            const regex_type* regex; // exposition only
        }
    }
An object of type `regex_iterator` that is not an end-of-sequence iterator holds a zero-length match if `match[0].matched == true` and `match[0].first == match[0].second`. [Note: For example, this can occur when the part of the regular expression that matched consists only of an assertion (such as `'.'`, `'\$'`, `'\b'`, `'\B')`. — end note]

### 30.12.1.1 Constructors

```
regex_iterator();
```

**Effects:** Constructs an end-of-sequence iterator.

```
regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
regex_constants::match_flag_type m = regex_constants::match_default);
```

**Effects:** Initializes `begin` and `end` to `a` and `b`, respectively, sets `pregex` to `addressof(re)`, sets `flags` to `m`, then calls `regex_search(begin, end, match, *pregex, flags)`. If this call returns `false` the constructor sets `*this` to the end-of-sequence iterator.

### 30.12.1.2 Comparisons

```
bool operator==(const regex_iterator& right) const;
```

**Returns:** `true` if `*this` and `right` are both end-of-sequence iterators or if the following conditions all hold:

1. `begin == right.begin`
2. `end == right.end`
3. `pregex == right.pregex`
4. `flags == right.flags` and
5. `match[0] == right.match[0]`

otherwise `false`.

### 30.12.1.3 Indirection

```
const value_type& operator*() const;
```

**Returns:** `match`.

```
const value_type* operator->() const;
```

**Returns:** `addressof(match)`.

### 30.12.1.4 Increment

```
regex_iterator& operator++();
```

**Effects:** Constructs a local variable `start` of type `BidirectionalIterator` and initializes it with the value of `match[0].second`.

1. If the iterator holds a zero-length match and `start == end` the operator sets `*this` to the end-of-sequence iterator and returns `*this`.

2. Otherwise, if the iterator holds a zero-length match, the operator calls:

   ```
   regex_search(start, end, match, *pregex,
   flags | regex_constants::match_not_null | regex_constants::match_continuous)
   ```

   If the call returns `true` the operator returns `*this`. Otherwise the operator increments `start` and continues as if the most recent match was not a zero-length match.

3. If the most recent match was not a zero-length match, the operator sets `flags` to `flags | regex_constants::match_prev_avail` and calls `regex_search(start, end, match, *pregex, flags)`. If
the call returns `false` the iterator sets `*this` to the end-of-sequence iterator. The iterator then returns
`*this`.

In all cases in which the call to `regex_search` returns `true`, `match.prefix().first` shall be equal to
the previous value of `match[0].second`, and for each index `i` in the half-open range `[0, match.size())`
for which `match[i].matched` is `true`, `match.position(i)` shall return `distance(begin, match[i].
first)`.

[Note: This means that `match.position(i)` gives the offset from the beginning of the target sequence,
which is often not the same as the offset from the sequence passed in the call to `regex_search`. — end
note]

It is unspecified how the implementation makes these adjustments.

[Note: This means that a compiler may call an implementation-specific search function, in which case a
program-defined specialization of `regex_search` will not be called. — end note]

```cpp
regex_iterator operator++(int);
```

Effects: As if by:

```cpp
regex_iterator tmp = *this;
++(*this);
return tmp;
```

### 30.12.2 Class template `regex_token_iterator` [re.tokiter]

The class template `regex_token_iterator` is an iterator adaptor; that is to say it represents a new view of
an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence,
and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator
is a `sub_match` class template instance that represents what matched a particular sub-expression within the
regular expression.

When class `regex_token_iterator` is used to enumerate a single sub-expression with index -1 the iterator
performs field splitting: that is to say it enumerates one sub-expression for each section of the character
container sequence that does not match the regular expression specified.

After it is constructed, the iterator finds and stores a value `regex_iterator<BidirectionalIterator>
position` and sets the internal count `N` to zero. It also maintains a sequence `subs` which contains a list of
the sub-expressions which will be enumerated. Every time `operator++` is used the count `N` is incremented; if
`N` exceeds or equals `subs.size()`, then the iterator increments member `position` and sets count `N` to zero.

If the end of sequence is reached (position is equal to the end of sequence iterator), the iterator becomes
equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index -1, in
which case the iterator enumerates one last sub-expression that contains all the characters from the end of
the last regular expression match to the end of the input sequence being enumerated, provided that this
would not be an empty sub-expression.

The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator
to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined.
For any other iterator value a `const sub_match<BidirectionalIterator>&` is returned. The result of
`operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub-
match<BidirectionalIterator>*` is returned.

It is impossible to store things into `regex_token_iterator`. Two end-of-sequence iterators are always equal.
An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators
are equal when they are constructed from the same arguments.

```cpp
namespace std {
    template<class BidirectionalIterator,
             class charT = typename iterator_traits<BidirectionalIterator>::value_type,
             class traits = regex_traits<charT>>
    class regex_token_iterator {
        public:
            using regex_type = basic_regex<charT, traits>;
            using iterator_category = forward_iterator_tag;
            using value_type = sub_match<BidirectionalIterator>;
            using difference_type = ptrdiff_t;
            using pointer = const value_type*;
```
using reference = const value_type&;

regex_token_iterator();
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
int submatch = 0,
regex_constants::match_flag_type m =
regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
const vector<int>& submatches,
regex_constants::match_flag_type m =
regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
initializer_list<int> submatches,
regex_constants::match_flag_type m =
regex_constants::match_default);

template<size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
const int (&submatches)[N],
regex_constants::match_flag_type m =
regex_constants::match_default) = delete;

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
const vector<int>& submatches,
regex_constants::match_flag_type m =
regex_constants::match_default) = delete;

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
initializer_list<int> submatches,
regex_constants::match_flag_type m =
regex_constants::match_default) = delete;

template<size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
const int (&submatches)[N],
regex_constants::match_flag_type m =
regex_constants::match_default) = delete;

regex_token_iterator(const regex_token_iterator&);
regex_token_iterator& operator=(const regex_token_iterator&);
bool operator==(const regex_token_iterator& const);
const value_type& operator*() const;
const value_type* operator->() const;
regex_token_iterator& operator++();
regex_token_iterator operator++(int);

private:
using position_iterator =
regex_iterator<BidirectionalIterator, charT, traits>; // exposition only
position_iterator position; // exposition only
const value_type* result; // exposition only
value_type suffix; // exposition only
size_t N; // exposition only
vector<int> subs; // exposition only
};
A suffix iterator is a regex_token_iterator object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member `result` holds a pointer to the data member `suffix`, the value of the member `suffix.match` is true, `suffix.first` points to the beginning of the final sequence, and `suffix.second` points to the end of the final sequence.

[Note: For a suffix iterator, data member `suffix.first` is the same as the end of the last match found, and `suffix.second` is the same as the end of the target sequence. — end note]

The current match is `(*position).prefix()` if `subs[N] == -1`, or `(*position)[subs[N]]` for any other value of `subs[N]`.

### 30.12.2.1 Constructors

`regex_token_iterator();`

**Effects:** Constructs the end-of-sequence iterator.

```cpp
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b, const regex_type& re, int submatch = 0, regex_constants::match_flag_type m = regex_constants::match_default);
```

```cpp
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b, const regex_type& re, const vector<int>& submatches, regex_constants::match_flag_type m = regex_constants::match_default);
```

```cpp
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b, const regex_type& re, initializer_list<int> submatches, regex_constants::match_flag_type m = regex_constants::match_default);
```

```cpp
template<size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b, const regex_type& re, const int (&submatches)[N], regex_constants::match_flag_type m = regex_constants::match_default);
```

**Preconditions:** Each of the initialization values of `submatches` is >= -1.

**Effects:** The first constructor initializes the member `subs` to hold the single value `submatch`. The second, third, and fourth constructors initialize the member `subs` to hold a copy of the sequence of integer values pointed to by the iterator range `[begin(submatches), end(submatches))`.

Each constructor then sets `N` to 0, and `position` to `position_iterator(a, b, re, m)`. If `position` is not an end-of-sequence iterator the constructor sets `result` to the address of the current match. Otherwise if any of the values stored in `subs` is equal to -1 the constructor sets `*this` to a suffix iterator that points to the range `[a, b)`, otherwise the constructor sets `*this` to an end-of-sequence iterator.

### 30.12.2.2 Comparisons

`bool operator==(const regex_token_iterator& right) const;`

**Returns:** true if `*this` and `right` are both end-of-sequence iterators, or if `*this` and `right` are both suffix iterators and `suffix == right.suffix`; otherwise returns false if `*this` or `right` is an end-of-sequence iterator or a suffix iterator. Otherwise returns true if `position == right.position`, `N == right.N`, and `subs == right.subs`. Otherwise returns false.

### 30.12.2.3 Indirection

`const value_type& operator*() const;`

**Returns:** `*result`.

`const value_type* operator->() const;`

**Returns:** `result`.

§ 30.12.2.3 ©ISO/IEC 2020 – All rights reserved
30.12.2.4 Increment

```cpp
regex_token_iterator& operator++();
```

**Effects:** Constructs a local variable `prev` of type `position_iterator`, initialized with the value of `position`.
1. If `*this` is a suffix iterator, sets `*this` to an end-of-sequence iterator.
2. Otherwise, if \( N + 1 < \text{subs.size()} \), increments \( N \) and sets `result` to the address of the current match.
3. Otherwise, sets \( N \) to 0 and increments `position`. If `position` is not an end-of-sequence iterator the operator sets `result` to the address of the current match.
4. Otherwise, if any of the values stored in `subs` is equal to -1 and `prev->suffix().length()` is not 0 the operator sets `*this` to a suffix iterator that points to the range `[prev->suffix().first, prev->suffix().second)`.
5. Otherwise, sets `*this` to an end-of-sequence iterator.
6. Returns: `*this`

```cpp
regex_token_iterator& operator++(int);
```

**Effects:** Constructs a copy `tmp` of `*this`, then calls `++(*this)`.

30.13 Modified ECMAScript regular expression grammar

The regular expression grammar recognized by `basic_regex` objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.

Objects of type specialization of `basic_regex` store within themselves a default-constructed instance of their `traits` template parameter, henceforth referred to as `traits_inst`. This `traits_inst` object is used to support localization of the regular expression; `basic_regex` member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.

The following productions within the ECMAScript grammar are modified as follows:

```
ClassAtom ::=
    ClassAtomNoDash
    ClassAtomExClass
    ClassAtomCollatingElement
    ClassAtomEquivalence

IdentityEscape ::=
    SourceCharacter but not c
```

The following new productions are then added:

```
ClassAtomExClass ::=
    [: ClassName :]
ClassAtomCollatingElement ::=
    [. ClassName .]
ClassAtomEquivalence ::=
    [= ClassName =]
```

The productions `ClassAtomExClass`, `ClassAtomCollatingElement` and `ClassAtomEquivalence` provide functionality equivalent to that of the same features in regular expressions in POSIX.

The regular expression grammar may be modified by any `regex_constants::syntax_option_type` flags specified when constructing an object of type specialization of `basic_regex` according to the rules in Table 136.
A `ClassName` production, when used in `ClassAtomExtClass`, is not valid if `traits_inst.lookup_classname` returns zero for that name. The names recognized as valid `ClassName`s are determined by the type of the traits class, but at least the following names shall be recognized: `alnum`, `alpha`, `blank`, `cntrl`, `digit`, `graph`, `lower`, `print`, `punct`, `space`, `upper`, `xdigit`, `d`, `s`, `w`. In addition the following expressions shall be equivalent:

```
\d and [[[:digit:]]]
\D and [!][:digit:]]
\s and [[[:space:]]]
\S and [!][:space:]]
\w and [[:alnum:]]
\W and [!][:alnum:]]
```

A `ClassName` production when used in a `ClassAtomCollatingElement` production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string.

The results from multiple calls to `traits_inst.lookup_classname` can be bitwise OR’ed together and subsequently passed to `traits_inst.isctype`.

A `ClassName` production when used in a `ClassAtomEquivalence` production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string or if the value returned by `traits_inst.transform_primary` for the result of the call to `traits_inst.lookup_collatename` is an empty string.

When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type `regex_error`.

If the CV of a `UnicodeEscapeSequence` is greater than the largest value that can be held in an object of type `charT` the translator shall throw an exception object of type `regex_error`. [Note: This means that values of the form "uxxxxx" that do not fit in a character are invalid. – end note]

Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling `traits_inst.value`.

The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any `match_flag_type` flags (30.5.2) specified when using the regular expression object in one of the regular expression algorithms (30.11). The behavior is also localized by interaction with the traits class template parameter as follows:

(14.1) — During matching of a regular expression finite state machine against a sequence of characters, two characters c and d are compared using the following rules:

(14.1.1) — if (flags() & regex_constants::icase) the two characters are equal if `traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d)`;

(14.1.2) — otherwise, if flags() & regex_constants::collate the two characters are equal if `traits_inst.translate(c) == traits_inst.translate(d)`;

(14.1.3) — otherwise, the two characters are equal if `c == d`.

(14.2) — During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range c1-c2 against a character c is conducted as follows: if `flags() & regex_constants::collate` is false then the character c is matched if `c1 <= c && c <= c2`, otherwise c is matched in accordance with the following algorithm:

```c++
string_type str1 = string_type(1,
    flags() & icase ?
    traits_inst.translate_nocase(c1) : traits_inst.translate(c1));
string_type str2 = string_type(1,
    flags() & icase ?
    traits_inst.translate_nocase(c2) : traits_inst.translate(c2));
string_type str = string_type(1,
    flags() & icase ?
    traits_inst.translate_nocase(c) : traits_inst.translate(c));
```
return traits_inst.transform(str1.begin(), str1.end())
  <= traits_inst.transform(str.begin(), str.end())
& traits_inst.transform(str.begin(), str.end())
  <= traits_inst.transform(str2.begin(), str2.end());

— During matching of a regular expression finite state machine against a sequence of characters, testing
whether a collating element is a member of a primary equivalence class is conducted by first converting
the collating element and the equivalence class to sort keys using traits::transform_primary, and
then comparing the sort keys for equality.

— During matching of a regular expression finite state machine against a sequence of characters, a
character c is a member of a character class designated by an iterator range [first, last) if traits-
inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icase)) is true.

31 Atomic operations library

31.1 General

1 This Clause describes components for fine-grained atomic access. This access is provided via operations on atomic objects.

2 The following subclauses describe atomics requirements and components for types and operations, as summarized in Table 143.

Table 143: Atomics library summary

31.3 Type aliases

1 The type aliases atomic_intN_t, atomic_uintN_t, atomic_intptr_t, and atomic_uintptr_t are defined if and only if intN_t, uintN_t, intptr_t, and uintptr_t are defined, respectively.

2 The type aliases atomic_signed_lock_free and atomic_unsigned_lock_free name specializations of atomic whose template arguments are integral types, respectively signed and unsigned, and whose is_always_lock_free property is true. [Note: These aliases are optional in freestanding implementations (16.5.1.3). —end note] Implementations should choose for these aliases the integral specializations of atomic for which the atomic waiting and notifying operations (31.6) are most efficient.

31.4 Order and consistency

namespace std {
  enum class memory_order : unspecified {
    relaxed, consume, acquire, release, acq_rel, seq_cst
  };
  inline constexpr memory_order memory_order_relaxed = memory_order::relaxed;
  inline constexpr memory_order memory_order_release = memory_order::release;
  inline constexpr memory_order memory_order_acquire = memory_order::acquire;
  inline constexpr memory_order memory_order_acq_rel = memory_order::acq_rel;
  inline constexpr memory_order memory_order_seq_cst = memory_order::seq_cst;
}

1 The enumeration memory_order specifies the detailed regular (non-atomic) memory synchronization order as defined in 6.9.2 and may provide for operation ordering. Its enumerated values and their meanings are as follows:

(1.1) — memory_order::relaxed: no operation orders memory.
(1.2) — memory_order::release, memory_order::acq_rel, and memory_order::seq_cst: a store operation performs a release operation on the affected memory location.
(1.3) — memory_order::consume: a load operation performs a consume operation on the affected memory location. [Note: Prefer memory_order::acquire, which provides stronger guarantees than memory_order::consume. Implementations have found it infeasible to provide performance better than that of memory_order::acquire. Specification revisions are under consideration. —end note]
— `memory_order::acquire`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a load operation performs an acquire operation on the affected memory location.

[Note: Atomic operations specifying `memory_order::relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object. — end note]

2 An atomic operation $A$ that performs a release operation on an atomic object $M$ synchronizes with an atomic operation $B$ that performs an acquire operation on $M$ and takes its value from any side effect in the release sequence headed by $A$.

3 An atomic operation $A$ on some atomic object $M$ is coherence-ordered before another atomic operation $B$ on $M$ if

1. $A$ is a modification, and $B$ reads the value stored by $A$, or
2. $A$ precedes $B$ in the modification order of $M$, or
3. $A$ and $B$ are not the same atomic read-modify-write operation, and there exists an atomic modification $X$ of $M$ such that $A$ reads the value stored by $X$ and $X$ precedes $B$ in the modification order of $M$, or
4. there exists an atomic modification $X$ of $M$ such that $A$ is coherence-ordered before $X$ and $X$ is coherence-ordered before $B$.

4 There is a single total order $S$ on all `memory_order::seq_cst` operations, including fences, that satisfies the following constraints. First, if $A$ and $B$ are `memory_order::seq_cst` operations and $A$ strongly happens before $B$, then $A$ precedes $B$ in $S$. Second, for every pair of atomic operations $A$ and $B$ on an object $M$, where $A$ is coherence-ordered before $B$, the following four conditions are required to be satisfied by $S$:

1. if $A$ and $B$ are both `memory_order::seq_cst` operations, then $A$ precedes $B$ in $S$; and
2. if $A$ is a `memory_order::seq_cst` operation and $B$ happens before a `memory_order::seq_cst` fence $Y$, then $A$ precedes $Y$ in $S$; and
3. if a `memory_order::seq_cst` fence $X$ happens before $A$ and $B$ is a `memory_order::seq_cst` operation, then $X$ precedes $B$ in $S$; and
4. if a `memory_order::seq_cst` fence $X$ happens before $A$ and $B$ happens before a `memory_order::seq_cst` fence $Y$, then $X$ precedes $Y$ in $S$.

5 [Note: This definition ensures that $S$ is consistent with the modification order of any atomic object $M$. It also ensures that a `memory_order::seq_cst` load $A$ of $M$ gets its value either from the last modification of $M$ that precedes $A$ in $S$ or from some non-`memory_order::seq_cst` modification of $M$ that does not happen before any modification of $M$ that precedes $A$ in $S$. — end note]

6 [Note: We do not require that $S$ be consistent with “happens before” (6.9.2.1). This allows more efficient implementation of `memory_order::acquire` and `memory_order::release` on some machine architectures. It can produce surprising results when these are mixed with `memory_order::seq_cst` accesses. — end note]

7 [Note: `memory_order::seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order::seq_cst` atomic operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In many cases, `memory_order::seq_cst` atomic operations are reorderable with respect to other atomic operations performed by the same thread. — end note]

8 Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

[Note: For example, with $x$ and $y$ initially zero,

```c
// Thread 1:
r1 = y.load(memory_order::relaxed);
x.store(r1, memory_order::relaxed);
// Thread 2:
r2 = x.load(memory_order::relaxed);
y.store(r2, memory_order::relaxed);
```

should not produce $r1 == r2 == 42$, since the store of 42 to $y$ is only possible if the store to $x$ stores 42, which circularly depends on the store to $y$ storing 42. Note that without this restriction, such an execution is possible. — end note]
Note: The recommendation similarly disallows \( r1 == r2 == 42 \) in the following example, with \( x \) and \( y \) again initially zero:

```cpp
// Thread 1:
r1 = x.load(memory_order::relaxed);
if (r1 == 42) y.store(42, memory_order::relaxed);
// Thread 2:
r2 = y.load(memory_order::relaxed);
if (r2 == 42) x.store(42, memory_order::relaxed);
```

—end note

Atomic read-modify-write operations shall always read the last value (in the modification order) written before the write associated with the read-modify-write operation.

Implementations should make atomic stores visible to atomic loads within a reasonable amount of time.

```cpp
template<class T>
T kill_dependency(T y) noexcept;
```

Effects: The argument does not carry a dependency to the return value (6.9.2).

Returns: \( y \).

31.5 Lock-free property

The `ATOMIC_..._LOCK_FREE` macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial) specializations of the `atomic` template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.

At least one signed integral specialization of the `atomic` template, along with the specialization for the corresponding unsigned type (6.8.1), is always lock-free. [Note: This requirement is optional in freestanding implementations (16.5.1.3). —end note]

The function `atomic_is_lock_free` (31.8.1) indicates whether the object is lock-free. In any given program execution, the result of the lock-free query shall be consistent for all pointers of the same type.

Atomic operations that are not lock-free are considered to potentially block (6.9.2.2).

Note: Operations that are lock-free should also be address-free. That is, atomic operations on the same memory location via two different addresses will communicate atomically. The implementation should not depend on any per-process state. This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes. —end note]

31.6 Waiting and notifying

Atomic waiting operations and atomic notifying operations provide a mechanism to wait for the value of an atomic object to change more efficiently than can be achieved with polling. An atomic waiting operation may block until it is unblocked by an atomic notifying operation, according to each function’s effects. [Note: Programs are not guaranteed to observe transient atomic values, an issue known as the A-B-A problem, resulting in continued blocking if a condition is only temporarily met. —end note]

Note: The following functions are atomic waiting operations:

(2.1) — atomic<T>::wait,
(2.2) — atomic_flag::wait,
3.17 Class template atomic_ref

namespace std {
    template<class T> struct atomic_ref {
        private:
            T* ptr; // exposition only
        public:
            using value_type = T;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
            explicit atomic_ref(T&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;
            void store(T, memory_order = memory_order::seq_cst) const noexcept;
            T operator=(T) const noexcept;
            T load(memory_order = memory_order::seq_cst) const noexcept;
            operator T() const noexcept;
            T exchange(T, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(T&, T, memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(T&, T, memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) const noexcept;
            void wait(T, memory_order = memory_order::seq_cst) const noexcept;
            void notify_one() const noexcept;
            void notify_all() const noexcept;
    };
}

1 An atomic_ref object applies atomic operations (31.1) to the object referenced by *ptr such that, for the lifetime (6.7.3) of the atomic_ref object, the object referenced by *ptr is an atomic object (6.9.2.1).

2 The program is ill-formed if is_trivially_copyable_v<T> is false.

(2.3) — atomic_wait and atomic_wait_explicit,
(2.4) — atomic_flag_wait and atomic_flag_wait_explicit, and
(2.5) — atomic_ref<T>::wait.

— end note

[Note: The following functions are atomic notifying operations:

(3.1) — atomic<T>::notify_one and atomic<T>::notify_all,
(3.2) — atomic_flag::notify_one and atomic_flag::notify_all,
(3.3) — atomic_notify_one and atomic_notify_all,
(3.4) — atomic_flag_notify_one and atomic_flag_notify_all, and
(3.5) — atomic_ref<T>::notify_one and atomic_ref<T>::notify_all.

— end note]

4 A call to an atomic waiting operation on an atomic object M is eligible to be unblocked by a call to an atomic notifying operation on M if there exist side effects X and Y on M such that:

(4.1) — the atomic waiting operation has blocked after observing the result of X,
(4.2) — X precedes Y in the modification order of M, and
(4.3) — Y happens before the call to the atomic notifying operation.
The lifetime (6.7.3) of an object referenced by *ptr shall exceed the lifetime of all atomicRefs that reference the object. While any atomicRef instances exist that reference the *ptr object, all accesses to that object shall exclusively occur through those atomicRef instances. No subobject of the object referenced by atomicRef shall be concurrently referenced by any other atomicRef object.

Atomic operations applied to an object through a referencing atomicRef are atomic with respect to atomic operations applied through any other atomicRef referencing the same object. [Note: Atomic operations or the atomicRef constructor could acquire a shared resource, such as a lock associated with the referenced object, to enable atomic operations to be applied to the referenced object. — end note]

31.7.1 Operations

static constexpr size_t required_alignment;

The alignment required for an object to be referenced by an atomic reference, which is at least alignof(T).

[Note: Hardware could require an object referenced by an atomicRef to have stricter alignment (6.7.6) than other objects of type T. Further, whether operations on an atomicRef are lock-free could depend on the alignment of the referenced object. For example, lock-free operations on std::complex<double> could be supported only if aligned to 2*alignof(double). — end note]

static constexpr bool is_always_lock_free;

The static data member is_always_lock_free is true if the atomicRef type’s operations are always lock-free, and false otherwise.

bool is_lock_free() const noexcept;

Returns: true if operations on all objects of the type atomicRef<T> are lock-free, false otherwise.

atomicRef(T& obj);

Preconditions: The referenced object is aligned to required_alignment.

Postconditions: *this references obj.

Throws: Nothing.

atomicRef(const atomicRef& ref) noexcept;

Postconditions: *this references the object referenced by ref.

void store(T desired, memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: The order argument is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.

Effects: Atomically replaces the value referenced by *ptr with the value of desired. Memory is affected according to the value of order.

T operator=(T desired) const noexcept;

Effects: Equivalent to:

    store(desired);
    return desired;

T load(memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: The order argument is neither memory_order::release nor memory_order::acq_rel.

Effects: Memory is affected according to the value of order.

Returns: Atomically returns the value referenced by *ptr.

operator T() const noexcept;

Effects: Equivalent to: return load();

T exchange(T desired, memory_order order = memory_order::seq_cst) const noexcept;

Effects: Atomically replaces the value referenced by *ptr with desired. Memory is affected according to the value of order. This operation is an atomic read-modify-write operation (6.9.2).
Returns: Atomically returns the value referenced by *ptr immediately before the effects.

<table>
<thead>
<tr>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>bool compare_exchange_weak(T&amp; expected, T desired, memory_order success, memory_order failure) const noexcept;</td>
</tr>
<tr>
<td>bool compare_exchange_strong(T&amp; expected, T desired, memory_order success, memory_order failure) const noexcept;</td>
</tr>
<tr>
<td>bool compare_exchange_weak(T&amp; expected, T desired, memory_order order = memory_order::seq_cst) const noexcept;</td>
</tr>
<tr>
<td>bool compare_exchange_strong(T&amp; expected, T desired, memory_order order = memory_order::seq_cst) const noexcept;</td>
</tr>
</tbody>
</table>

Preconditions: The failure argument is neither memory_order::release nor memory_order::acq_rel.

Effects: Retrieves the value in expected. It then atomically compares the value represented by *ptr for equality with that previously retrieved from expected, and if true, replaces the value referenced by *ptr with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. When only one memory_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value read from the value referenced by *ptr during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.9.2.1) on the value referenced by *ptr. Otherwise, these operations are atomic load operations on that memory.

Returns: The result of the comparison.

Remarks: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by expected and ptr are equal, it may return false and store back to expected the same memory contents that were originally there. [Note: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — end note]

void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Repeatedly performs the following steps, in order:

(23.1) Evaluates load(order) and compares its value representation for equality against that of old.
(23.2) If they compare unequal, returns.
(23.3) Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: This function is an atomic waiting operation (31.6) on atomic object *ptr.

void notify_one() const noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation on *ptr that is eligible to be unblocked (31.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (31.6) on atomic object *ptr.

void notify_all() const noexcept;

Effects: Unblocks the execution of all atomic waiting operations on *ptr that are eligible to be unblocked (31.6) by this call.

Remarks: This function is an atomic notifying operation (31.6) on atomic object *ptr.
31.7.2 Specializations for integral types

There are specializations of the \texttt{atomic\_ref} class template for the integral types \texttt{char}, \texttt{signed char}, \texttt{unsigned char}, \texttt{short}, \texttt{unsigned short}, \texttt{int}, \texttt{unsigned int}, \texttt{long}, \texttt{unsigned long}, \texttt{long long}, \texttt{unsigned long long}, \texttt{char8\_t}, \texttt{char16\_t}, \texttt{char32\_t}, \texttt{wchar\_t}, and any other types needed by the typedefs in the header \texttt{<cstdint>} (17.4.1). For each such type \texttt{integral}, the specialization \texttt{atomic\_ref<integral>} provides additional atomic operations appropriate to integral types. [Note: The specialization \texttt{atomic\_ref<bool>} uses the primary template (31.7). — end note]

namespace std {
  template<> struct atomic\_ref<integral> {
    private:
      integral* ptr; // exposition only
    public:
      using value\_type = integral;
      using difference\_type = value\_type;
      static constexpr size\_t required\_alignment = implementation\_defined;
      static constexpr bool is\_always\_lock\_free = implementation\_defined;
      bool is\_lock\_free() const noexcept;
      explicit atomic\_ref(integral&);
      atomic\_ref(const atomic\_ref&) noexcept;
      atomic\_ref& operator=(const atomic\_ref&) = delete;

      void store(integral, memory\_order = memory\_order::seq\_cst) const noexcept;
      integral operator=(integral) const noexcept;
      integral load(memory\_order = memory\_order::seq\_cst) const noexcept;
      operator integral() const noexcept;

      integral exchange(integral,
        memory\_order = memory\_order::seq\_cst) const noexcept;
      bool compare\_exchange\_weak(integral&, integral,
        memory\_order, memory\_order) const noexcept;
      bool compare\_exchange\_strong(integral&, integral,
        memory\_order, memory\_order) const noexcept;
      bool compare\_exchange\_weak(integral&, integral,
        memory\_order = memory\_order::seq\_cst) const noexcept;
      bool compare\_exchange\_strong(integral&, integral,
        memory\_order = memory\_order::seq\_cst) const noexcept;

      integral fetch\_add(integral,
        memory\_order = memory\_order::seq\_cst) const noexcept;
      integral fetch\_sub(integral,
        memory\_order = memory\_order::seq\_cst) const noexcept;
      integral fetch\_and(integral,
        memory\_order = memory\_order::seq\_cst) const noexcept;
      integral fetch\_or(integral,
        memory\_order = memory\_order::seq\_cst) const noexcept;
      integral fetch\_xor(integral,
        memory\_order = memory\_order::seq\_cst) const noexcept;

      integral operator++(int) const noexcept;
      integral operator--(int) const noexcept;
      integral operator++() const noexcept;
      integral operator--() const noexcept;
      integral operator+=(integral) const noexcept;
      integral operator-=(integral) const noexcept;
      integral operator&=(integral) const noexcept;
      integral operator|=(integral) const noexcept;
      integral operator^=(integral) const noexcept;

      void wait(integral, memory\_order = memory\_order::seq\_cst) const noexcept;
      void notify\_one() const noexcept;
      void notify\_all() const noexcept;
  };

¥ 31.7.2 ©ISO/IEC 2020 – All rights reserved 1530
The following operations perform arithmetic computations. The key, operator, and computation correspondence is identified in Table 144.

int integral fetch_key(integral operand, memory_order order = memory_order::seq_cst) const noexcept;

Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2.1).

Returns: Atomically, the value referenced by *ptr immediately before the effects.

Remarks: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type. [Note: There are no undefined results arising from the computation. — end note]

int integral operator op=(integral operand) const noexcept;

Effects: Equivalent to: return fetch_key(operand) op operand;

31.7.3 Specializations for floating-point types [atomics.ref.float]

There are specializations of the atomic_ref class template for the floating-point types float, double, and long double. For each such type floating-point, the specialization atomic_ref-floating-point provides additional atomic operations appropriate to floating-point types.

```cpp
namespace std {
    template<typename floating-point> struct atomic_ref {
        private:
            floating-point* ptr; // exposition only
        public:
            using value_type = floating-point;
            using difference_type = value_type;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
            explicit atomic_ref(floating-point&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;
            void store(floating-point, memory_order = memory_order::seq_cst) const noexcept;
            floating-point operator=(floating-point) const noexcept;
            floating-point load(memory_order = memory_order::seq_cst) const noexcept;
            operator floating-point() const noexcept;
            floating-point exchange(floating-point,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(floating-point&, floating-point,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(floating-point&, floating-point,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(floating-point&, floating-point,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(floating-point&, floating-point,
                memory_order = memory_order::seq_cst) const noexcept;
            floating-point fetch_add(floating-point,
                memory_order = memory_order::seq_cst) const noexcept;
            floating-point fetch_sub(floating-point,
                memory_order = memory_order::seq_cst) const noexcept;
    };
}
floating-point operator+=(floating-point) const noexcept;
floating-point operator-=(floating-point) const noexcept;

void wait(floating-point, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};
}

Descriptions are provided below only for members that differ from the primary template.

The following operations perform arithmetic computations. The key, operator, and computation correspondence are identified in Table 144.

floating-point fetch_key(floating-point operand,
memory_order order = memory_order::seq_cst) const noexcept;

Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied
to the value referenced by *ptr and the given operand. Memory is affected according to the value of
order. These operations are atomic read-modify-write operations (6.9.2.1).

Returns: Atomically, the value referenced by *ptr immediately before the effects.

Remarks: If the result is not a representable value for its type (7.1), the result is unspecified, but the
operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point
should conform to the std::numeric_limits<floating-point> traits associated with the floating-
point type (17.3.3). The floating-point environment (26.3) for atomic arithmetic operations on
floating-point may be different than the calling thread's floating-point environment.

floating-point operator op=(floating-point operand) const noexcept;

Effects: Equivalent to: return fetch_key(operand) op operand;

31.7.4 Partial specialization for pointers

namespace std {
    template<class T> struct atomic_ref<T*> {
        private:
            T** ptr;  // exposition only
        public:
            using value_type = T*;
            using difference_type = ptrdiff_t;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
            explicit atomic_ref(T*&) noexcept;
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;

            void store(T*, memory_order = memory_order::seq_cst) const noexcept;
            T* operator=(T*) const noexcept;
            T* load(memory_order = memory_order::seq_cst) const noexcept;
            operator T*() const noexcept;
            T* exchange(T*, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(T*&, T*,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(T*&, T*,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(T*&, T*,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(T*&, T*,
                memory_order = memory_order::seq_cst) const noexcept;
    };
};
T* fetch_add(difference_type, memory_order = memory_order::seq_cst) const noexcept;
T* fetch_sub(difference_type, memory_order = memory_order::seq_cst) const noexcept;
T* operator++(int) const noexcept;
T* operator--(int) const noexcept;
T* operator++() const noexcept;
T* operator--() const noexcept;
T* operator+=(difference_type) const noexcept;
T* operator-=(difference_type) const noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};

1 Descriptions are provided below only for members that differ from the primary template.
2 The following operations perform arithmetic computations. The key, operator, and computation correspondence is identified in Table 145.
T* fetch_key(difference_type operand, memory_order order = memory_order::seq_cst) const noexcept;

3 **Mandates:** T is a complete object type.

4 **Effects:** Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2.1).

5 **Returns:** Atomically, the value referenced by *ptr immediately before the effects.

6 **Remarks:** The result may be an undefined address, but the operations otherwise have no undefined behavior.

T* operator op=(difference_type operand) const noexcept;

7 **Effects:** Equivalent to: return fetch_key(operand) op operand;

### 31.7.5 Member operators common to integers and pointers to objects

[atomics.ref.memop]

value_type operator++(int) const noexcept;

1 **Effects:** Equivalent to: return fetch_add(1);

value_type operator--(int) const noexcept;

2 **Effects:** Equivalent to: return fetch_sub(1);

value_type operator++() const noexcept;

3 **Effects:** Equivalent to: return fetch_add(1) + 1;

value_type operator--() const noexcept;

4 **Effects:** Equivalent to: return fetch_sub(1) - 1;

### 31.8 Class template atomic

[atomics.types.generic]

namespace std {

    template<class T> struct atomic {
        using value_type = T;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        // 31.8.1, operations on atomic types
        constexpr atomic() noexcept;
        constexpr atomic(T) noexcept;
        atomic(const atomic&) = delete;
    }
}

§ 31.8 ©ISO/IEC 2020 – All rights reserved
atomic& operator=(const atomic&) = delete;
atomic& operator=(const atomic&) volatile = delete;

T load(memory_order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order = memory_order::seq_cst) const noexcept;
operator T() const volatile noexcept;
operator T() const noexcept;
void store(T, memory_order = memory_order::seq_cst) volatile noexcept;
void store(T, memory_order = memory_order::seq_cst) noexcept;
T operator=(T) volatile noexcept;
T operator=(T) noexcept;
T exchange(T, memory_order = memory_order::seq_cst) volatile noexcept;
T exchange(T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) volatile noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) volatile noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;

bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) noexcept;
void wait(T, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;

1 The template argument for \( T \) shall meet the \texttt{Cpp17CopyConstructible} and \texttt{Cpp17CopyAssignable} requirements. The program is ill-formed if any of

\begin{enumerate}
\item \texttt{is_trivially_copyable_v<T>},
\item \texttt{is_copy_constructible_v<T>},
\item \texttt{is_move_constructible_v<T>},
\item \texttt{is_copyAssignable_v<T>}, or
\item \texttt{is_moveAssignable_v<T>}
\end{enumerate}

is \texttt{false}. [Note: Type arguments that are not also statically initializable may be difficult to use. — end note]

2 The specialization \texttt{atomic<bool>} is a standard-layout struct.

3 [Note: The representation of an atomic specialization need not have the same size and alignment requirement as its corresponding argument type. — end note]

### 31.8.1 Operations on atomic types \[\texttt{atomics.types.operations}\]

```cpp
constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
```

\begin{enumerate}
\item \texttt{is_default_constructible_v<T> is true.}
\item \texttt{Effects:} Initializes the atomic object with the value of \( T() \). Initialization is not an atomic operation (6.9.2).
\end{enumerate}

```cpp
constexpr atomic(T desired) noexcept;
```

\begin{enumerate}
\item \texttt{Effects:} Initializes the object with the value \texttt{desired}. Initialization is not an atomic operation (6.9.2). [Note: It is possible to have an access to an atomic object \( A \) race with its construction, for example by communicating the address of the just-constructed object \( A \) to another thread via \texttt{memory_order::relaxed} operations on a suitable atomic pointer variable, and then immediately accessing \( A \) in the receiving thread. This results in undefined behavior. — end note]
\end{enumerate}
static constexpr bool is_always_lock_free = implementation-defined;

The static data member is_always_lock_free is true if the atomic type’s operations are always lock-free, and false otherwise. [Note: The value of is_always_lock_free is consistent with the value of the corresponding ATOMIC_..._LOCK_FREE macro, if defined. — end note]

bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;

Returns: true if the object’s operations are lock-free, false otherwise. [Note: The return value of the is_lock_free member function is consistent with the value of is_always_lock_free for the same type. — end note]

void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
void store(T desired, memory_order order = memory_order::seq_cst) noexcept;

Preconditions: The order argument is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.
Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Atomically replaces the value pointed to by this with the value of desired. Memory is affected according to the value of order.

T operator=(T desired) volatile noexcept;
T operator=(T desired) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Equivalent to store(desired).
Returns: desired.

T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: The order argument is neither memory_order::release nor memory_order::acq_rel.
Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Memory is affected according to the value of order.
Returns: Atomically returns the value pointed to by this.

operator T() const volatile noexcept;
operator T() const noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Equivalent to: return load();

T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Atomically replaces the value pointed to by this with desired. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).
Returns: Atomically returns the value pointed to by this immediately before the effects.

bool compare_exchange_weak(T& expected, T desired, memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired, memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(T& expected, T desired, memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired, memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(T& expected, T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired, memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T& expected, T desired,
memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
memory_order order = memory_order::seq_cst) noexcept;

Preconditions: The failure argument is neither memory_order::release nor memory_order::acq_rel.

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Retrieves the value in expected. It then atomically compares the value representation of the value pointed to by this for equality with that previously retrieved from expected, and if true, replaces the value pointed to by this with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. When only one memory_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value pointed to by this during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.9.2) on the memory pointed to by this. Otherwise, these operations are atomic load operations on that memory.

Returns: The result of the comparison.

[Note: For example, the effect of compare_exchange_strong on objects without padding bits (6.8) is]

    if (memcmp(this, &expected, sizeof(*this)) == 0)
        memcpy(this, &desired, sizeof(*this));
    else
        memcpy(expected, this, sizeof(*this));

    — end note] [Example: The expected use of the compare-and-exchange operations is as follows. The compare-and-exchange operations will update expected when another iteration of the loop is needed.]

    expected = current.load();
    do {
        desired = function(expected);
    } while (!current.compare_exchange_weak(expected, desired));

    — end example] [Example: Because the expected value is updated only on failure, code releasing the memory containing the expected value on success will work. For example, list head insertion will act atomically and would not introduce a data race in the following code:

    do {
        p->next = head; // make new list node point to the current head
    } while (!head.compare_exchange_weak(p->next, p)); // try to insert

    — end example]

Implementations should ensure that weak compare-and-exchange operations do not consistently return false unless either the atomic object has value different from expected or there are concurrent modifications to the atomic object.

Remarks: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by expected and this are equal, it may return false and store back to expected the same memory contents that were originally there. [Note: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — end note]

[Note: Under cases where the memcpy and memcmp semantics of the compare-and-exchange operations apply, the outcome might be failed comparisons for values that compare equal with operator== if the value representation has trap bits or alternate representations of the same value. Notably, on implementations conforming to ISO/IEC/IEEE 60559, floating-point -0.0 and +0.0 will not compare equal with memcmp but will compare equal with operator==, and NaNs with the same payload will compare equal with memcmp but will not compare equal with operator==. — end note] [Note: Because
compare-and-exchange acts on an object’s value representation, padding bits that never participate in
the object’s value representation are ignored. As a consequence, the following code is guaranteed to
avoid spurious failure:

```c
struct padded {
    char clank = 0x42;
    // Padding here.
    unsigned biff = 0xCODEFEFE;
};
atomic<padded> pad = {};

bool zap() {
    padded expected, desired(0, 0);
    return pad.compare_exchange_strong(expected, desired);
}
```

— end note] [Note: For a union with bits that participate in the value representation of some members
but not others, compare-and-exchange might always fail. This is because such padding bits have an
indeterminate value when they do not participate in the value representation of the active member. As
a consequence, the following code is not guaranteed to ever succeed:

```c
union pony {
    double celestia = 0.;
    short luna;    // padded
};
atomic<pony> princesses = {};

bool party(pony desired) {
    pony expected;
    return princesses.compare_exchange_strong(expected, desired);
}
```

— end note]

void wait(T old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;

29 Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

30 Effects: Repeatedly performs the following steps, in order:

(30.1) — Evaluates load(order) and compares its value representation for equality against that of old.

(30.2) — If they compare unequal, returns.

(30.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

31 Remarks: This function is an atomic waiting operation (31.6).

void notify_one() volatile noexcept;
void notify_one() noexcept;

32 Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked
(31.6) by this call, if any such atomic waiting operations exist.

33 Remarks: This function is an atomic notifying operation (31.6).

void notify_all() volatile noexcept;
void notify_all() noexcept;

34 Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (31.6)
by this call.

35 Remarks: This function is an atomic notifying operation (31.6).

31.8.2 Specializations for integers [atomics.types.int]

1 There are specializations of the atomic class template for the integral types char, signed char, unsigned
char, short, unsigned short, int, unsigned int, long, unsigned long, long long, unsigned long
long, char8_t, char16_t, char32_t, wchar_t, and any other types needed by the typedefs in the header
<cstdint> (17.4.1). For each such type integral, the specialization atomic<integral> provides additional

§ 31.8.2 ©ISO/IEC 2020 – All rights reserved 1537
atomic operations appropriate to integral types. [Note: The specialization \texttt{atomic<bool>} uses the primary template (31.8). — end note]

```cpp
namespace std {
    template<> struct atomic<integral> {
        using value_type = integral;
        using difference_type = value_type;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(integral) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;
        void store(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(integral, memory_order = memory_order::seq_cst) noexcept;
        integral operator=(integral) volatile noexcept;
        integral operator=(integral) noexcept;
        integral load(memory_order = memory_order::seq_cst) const volatile noexcept;
        integral load(memory_order = memory_order::seq_cst) const noexcept;
        operator integral() const volatile noexcept;
        operator integral() const noexcept;
        integral exchange(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral exchange(integral, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(integral&, integral, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(integral&, integral, memory_order, memory_order) noexcept;
        bool compare_exchange_strong(integral&, integral, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(integral&, integral, memory_order, memory_order) noexcept;
        bool compare_exchange_weak(integral&, integral, memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_weak(integral&, integral, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(integral&, integral, memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_strong(integral&, integral, memory_order = memory_order::seq_cst) noexcept;
        integral fetch_add(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_add(integral, memory_order = memory_order::seq_cst) noexcept;
        integral fetch_sub(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_sub(integral, memory_order = memory_order::seq_cst) noexcept;
        integral fetch_and(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_and(integral, memory_order = memory_order::seq_cst) noexcept;
        integral fetch_or(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_or(integral, memory_order = memory_order::seq_cst) noexcept;
        integral fetch_xor(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_xor(integral, memory_order = memory_order::seq_cst) noexcept;
        integral operator++(int) volatile noexcept;
        integral operator++(int) noexcept;
        integral operator--(int) volatile noexcept;
        integral operator--(int) noexcept;
        integral operator++() volatile noexcept;
        integral operator++() noexcept;
        integral operator--() volatile noexcept;
    }

    § 31.8.2 ©ISO/IEC 2020 – All rights reserved 1538
```
integral operator--() noexcept;
integral operator+=(integral) volatile noexcept;
integral operator+=(integral) noexcept;
integral operator-=(integral) volatile noexcept;
integral operator-=(integral) noexcept;
integral operator&=(integral) volatile noexcept;
integral operator&=(integral) noexcept;
integral operator|=(integral) volatile noexcept;
integral operator|=(integral) noexcept;
integral operator^=(integral) volatile noexcept;
integral operator^=(integral) noexcept;

void wait(integral, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(integral, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;

};

2 The atomic integral specializations are standard-layout structs. They each have a trivial destructor.

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic computations. The key, operator, and computation correspondence is:

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

5 Constraints: For the volatile overload of this function, is_always_lock_free is true.

6 Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

7 Returns: Atomically, the value pointed to by this immediately before the effects.

8 Remarks: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type. [Note: There are no undefined results arising from the computation. — end note]

T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

9 Constraints: For the volatile overload of this function, is_always_lock_free is true.

10 Effects: Equivalent to: return fetch_key(operand) op operand;

31.8.3 Specializations for floating-point types  [atomics.types.float]

1 There are specializations of the atomic class template for the floating-point types float, double, and long double. For each such type floating-point, the specialization atomic<floating-point> provides additional atomic operations appropriate to floating-point types.

namespace std {
    template<>
    struct atomic<floating-point> {
        using value_type = floating-point;
        using difference_type = value_type;

§ 31.8.3 ©ISO/IEC 2020 – All rights reserved 1539
static constexpr bool is_always_lock_free = implementation-defined;
bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;
constexpr atomic() noexcept;
constexpr atomic(floating-point) noexcept;
atomic(const atomic&) = delete;
atomic& operator=(const atomic&) = delete;
atomic& operator=(const atomic&) volatile = delete;
void store(floating-point, memory_order = memory_order::seq_cst) volatile noexcept;
void store(floating-point, memory_order = memory_order::seq_cst) noexcept;
floating-point operator=(floating-point) volatile noexcept;
floating-point operator=(floating-point) noexcept;
floating-point load(memory_order = memory_order::seq_cst) volatile noexcept;
floating-point load(memory_order = memory_order::seq_cst) noexcept;
operator floating-point() volatile noexcep;
operator floating-point() noexcept;
floating-point exchange(floating-point,
    memory_order = memory_order::seq_cst) volatile noexcep;
floating-point exchange(floating-point,
    memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(floating-point&, floating-point,
    memory_order, memory_order) volatile noexcep;
bool compare_exchange_weak(floating-point&, floating-point,
    memory_order, memory_order) noexcept;
bool compare_exchange_strong(floating-point&, floating-point,
    memory_order, memory_order) volatile noexcep;
bool compare_exchange_strong(floating-point&, floating-point,
    memory_order, memory_order) noexcept;
bool compare_exchange_weak(floating-point&, floating-point,
    memory_order = memory_order::seq_cst) volatile noexcep;
bool compare_exchange_weak(floating-point&, floating-point,
    memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(floating-point&, floating-point,
    memory_order = memory_order::seq_cst) volatile noexcep;
bool compare_exchange_strong(floating-point&, floating-point,
    memory_order = memory_order::seq_cst) noexcept;
floating-point fetch_add(floating-point,
    memory_order = memory_order::seq_cst) volatile noexcep;
floating-point fetch_add(floating-point,
    memory_order = memory_order::seq_cst) noexcept;
floating-point fetch_sub(floating-point,
    memory_order = memory_order::seq_cst) volatile noexcep;
floating-point fetch_sub(floating-point,
    memory_order = memory_order::seq_cst) noexcept;
floating-point operator+=(floating-point) volatile noexcept;
floating-point operator+=(floating-point) noexcept;
floating-point operator-=(floating-point) volatile noexcept;
floating-point operator-=(floating-point) noexcept;
void wait(floating-point, memory_order = memory_order::seq_cst) const volatile noexcep;
void wait(floating-point, memory_order = memory_order::seq_cst) const noexcep;
void notify_one() volatile noexcep;
void notify_one() noexcep;
void notify_all() volatile noexcep;
void notify_all() noexcep;
};

2 The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.
ISO/IEC JTC1 SC22 WG21 N4860

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic addition and subtraction computations. The key, operator, and computation correspondence are identified in Table 144.

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

Returns: Atomically, the value pointed to by this immediately before the effects.

Remarks: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point should conform to the std::numeric_limits<floating-point> traits associated with the floating-point type (17.3.3). The floating-point environment (26.3) for atomic arithmetic operations on floating-point may be different than the calling thread’s floating-point environment.

T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Equivalent to: return fetch_key(operand) op operand;

Remarks: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point should conform to the std::numeric_limits<floating-point> traits associated with the floating-point type (17.3.3). The floating-point environment (26.3) for atomic arithmetic operations on floating-point may be different than the calling thread’s floating-point environment.

31.8.4 Partial specialization for pointers

namespace std {

    template<class T> struct atomic<T*> {
        using value_type = T*;
        using difference_type = ptrdiff_t;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(T*) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(T*, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(T*, memory_order = memory_order::seq_cst) noexcept;
        T* operator=(T*) volatile noexcept;
        T* operator=(T*) noexcept;
        T* load(memory_order = memory_order::seq_cst) const volatile noexcept;
        T* load(memory_order = memory_order::seq_cst) const noexcept;
        operator T*() const volatile noexcept;
        operator T*() const noexcept;

        T* exchange(T*, memory_order = memory_order::seq_cst) volatile noexcept;
        T* exchange(T*, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(T*&, T*, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(T*&, T*, memory_order, memory_order) noexcept;
        bool compare_exchange_strong(T*&, T*, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(T*&, T*, memory_order, memory_order) noexcept;
    }

} // namespace std
bool compare_exchange_weak(T*&, T*,
    memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T*&, T*,
    memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T*&, T*,
    memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T*&, T*,
    memory_order = memory_order::seq_cst) noexcept;
T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
T* operator++(int) volatile noexcept;
T* operator++(int) noexcept;
T* operator--(int) volatile noexcept;
T* operator--(int) noexcept;
T* operator++() volatile noexcept;
T* operator++() noexcept;
T* operator--() volatile noexcept;
T* operator--() noexcept;
T* operator+=(ptrdiff_t) volatile noexcept;
T* operator+=(ptrdiff_t) noexcept;
T* operator-=(ptrdiff_t) volatile noexcept;
T* operator-=(ptrdiff_t) noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

1 There is a partial specialization of the `atomic` class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial destructor.
2 Descriptions are provided below only for members that differ from the primary template.
3 The following operations perform pointer arithmetic. The key, operator, and computation correspondence is:

<table>
<thead>
<tr>
<th>Key</th>
<th>Op</th>
<th>Computation</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>+</td>
<td>addition</td>
</tr>
<tr>
<td>sub</td>
<td>-</td>
<td>subtraction</td>
</tr>
</tbody>
</table>

T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) noexcept;

4 Constraints: For the `volatile` overload of this function, `is_always_lock_free` is true.
5 Mandates: T is a complete object type. [Note: Pointer arithmetic on `void*` or function pointers is ill-formed. — end note]
6 Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).
7 Returns: Atomically, the value pointed to by this immediately before the effects.
8 Remarks: The result may be an undefined address, but the operations otherwise have no undefined behavior.
T* operator op=(ptrdiff_t operand) volatile noexcept;
T* operator op=(ptrdiff_t operand) noexcept;

9 Constraints: For the volatile overload of this function, is_always_lock_free is true.
10 Effects: Equivalent to: return fetch_key(operand) op operand;

31.8.5 Member operators common to integers and pointers to objects
[atomics.types.memop]

value_type operator++(int) volatile noexcept;
value_type operator++(int) noexcept;

1 Constraints: For the volatile overload of this function, is_always_lock_free is true.
2 Effects: Equivalent to: return fetch_add(1);

value_type operator--(int) volatile noexcept;
value_type operator--(int) noexcept;

3 Constraints: For the volatile overload of this function, is_always_lock_free is true.
4 Effects: Equivalent to: return fetch_sub(1);

value_type operator++() volatile noexcept;
value_type operator++() noexcept;

5 Constraints: For the volatile overload of this function, is_always_lock_free is true.
6 Effects: Equivalent to: return fetch_add(1) + 1;

value_type operator--() volatile noexcept;
value_type operator--() noexcept;

7 Constraints: For the volatile overload of this function, is_always_lock_free is true.
8 Effects: Equivalent to: return fetch_sub(1) - 1;

31.8.6 Partial specializations for smart pointers
[util.smartptr.atomic]

1 The library provides partial specializations of the atomic template for shared-ownership smart pointers (20.11). The behavior of all operations is as specified in 31.8, unless specified otherwise. The template parameter T of these partial specializations may be an incomplete type.

2 All changes to an atomic smart pointer in this subclause, and all associated use_count increments, are guaranteed to be performed atomically. Associated use_count decrements are sequenced after the atomic operation, but are not required to be part of it. Any associated deletion and deallocation are sequenced after the atomic update step and are not part of the atomic operation. [Note: If the atomic operation uses locks, locks acquired by the implementation will be held when any use_count adjustments are performed, and will not be held when any destruction or deallocation resulting from this is performed. — end note]

3 [Example:

```cpp
template<typename T> class atomic_list {
    struct node {
        T t;
        shared_ptr<node> next;
    };
    atomic<shared_ptr<node>> head;

    public:
    auto find(T t) const {
        auto p = head.load();
        while (p && p->t != t)
            p = p->next;
        return shared_ptr<node>(move(p));
    }

    void push_front(T t) {
        auto p = make_shared<node>();
```
p->t = t;
p->next = head;
while (!head.compare_exchange_weak(p->next, p)) {}
void operator=(shared_ptr<T> desired) noexcept;

Effects: Equivalent to store(desired).

shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Memory is affected according to the value of order.

Returns: Atomically returns p.

operator shared_ptr<T>() const noexcept;

Effects: Equivalent to: return load();

shared_ptr<T> exchange(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Atomically replaces p with desired as if by p.swap(desired). Memory is affected according to the value of order. This is an atomic read-modify-write operation (6.9.2.1).

Returns: Atomically returns the value of p immediately before the effects.

bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
memory_order success, memory_order failure) noexcept;

bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
memory_order success, memory_order failure) noexcept;

Preconditions: failure is neither memory_order::release nor memory_order::acq_rel.

Effects: If p is equivalent to expected, assigns desired to p and has synchronization semantics corresponding to the value of success, otherwise assigns p to expected and has synchronization semantics corresponding to the value of failure.

Returns: true if p was equivalent to expected, false otherwise.

Remarks: Two shared_ptr objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 31.8.1.

If the operation returns true, expected is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the operation is an atomic load operation on that memory, and expected is updated with the existing value read from the atomic object in the attempted atomic update. The use_count update corresponding to the write to expected is part of the atomic operation. The write to expected itself is not required to be part of the atomic operation.

bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:

return compare_exchange_weak(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:

return compare_exchange_strong(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Repeatedly performs the following steps, in order:

— Evaluates load(order) and compares it to old.
If the two are not equivalent, returns.

Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: Two `shared_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (31.6).

```cpp
void notify_one() noexcept;
```

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (31.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (31.6).

```cpp
void notify_all() noexcept;
```

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (31.6) by this call.

Remarks: This function is an atomic notifying operation (31.6).

### 31.8.6.2 Partial specialization for `weak_ptr`

```cpp
namespace std {
    template<class T> struct atomic<weak_ptr<T>> {
        using value_type = weak_ptr<T>
        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;
        atomic() noexcept;
        atomic(weak_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;
        weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        operator weak_ptr<T>() const noexcept;
        void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        void operator=(weak_ptr<T> desired) noexcept;
        weak_ptr<T> exchange(weak_ptr<T> desired,
            memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
            memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
            memory_order order = memory_order::seq_cst) noexcept;
        void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
        void notify_one() noexcept;
        void notify_all() noexcept;
    };
}
```

```cpp
constexpr atomic() noexcept;
```

Effects: Initializes `p{}`.

```cpp
atomic(weak_ptr<T> desired) noexcept;
```

Effects: Initializes the object with the value `desired`. Initialization is not an atomic operation (6.9.2). [Note: It is possible to have an access to an atomic object `A` race with its construction, for
example, by communicating the address of the just-constructed object $A$ to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing $A$ in the receiving thread. This results in undefined behavior. — end note

```cpp
doctorate(T) desired, memory_order order = memory_order::seq_cst) noexcept;
```

3

**Preconditions:** `order` is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.

4

**Effects:** Atomically replaces the value pointed to by `this` with the value of `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`.

```cpp
operator=(weak_ptr<T> desired) noexcept;
```

5

**Effects:** Equivalent to `store(desired)`.

```cpp
weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
```

6

**Preconditions:** `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

7

**Effects:** Memory is affected according to the value of `order`.

8

**Returns:** Atomically returns `p`.

```cpp
operator weak_ptr<T>() const noexcept;
```

9

**Effects:** Equivalent to: `return load();`

```cpp
weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

10

**Effects:** Atomically replaces `p` with `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`. This is an atomic read-modify-write operation (6.9.2.1).

11

**Returns:** Atomically returns the value of `p` immediately before the effects.

```cpp
bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
    memory_order success, memory_order failure) noexcept;
```

12

**Preconditions:** `failure` is neither `memory_order::release` nor `memory_order::acq_rel`.

13

**Effects:** If `p` is equivalent to `expected`, assigns `desired` to `p` and has synchronization semantics corresponding to the value of `success`, otherwise assigns `p` to `expected` and has synchronization semantics corresponding to the value of `failure`.

14

**Returns:** `true` if `p` was equivalent to `expected`, `false` otherwise.

15

**Remarks:** Two `weak_ptr` objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 31.8.1.

16

If the operation returns `true`, `expected` is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by `this`. Otherwise, the operation is an atomic load operation on that memory, and `expected` is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to the write to `expected` is part of the atomic operation. The write to `expected` itself is not required to be part of the atomic operation.

```cpp
bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
    memory_order order = memory_order::seq_cst) noexcept;
```

17

**Effects:** Equivalent to:

```cpp
return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```cpp
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
    memory_order order = memory_order::seq_cst) noexcept;
```

18

**Effects:** Equivalent to:
return compare_exchange_strong(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Repeatedly performs the following steps, in order:

(20.1) Evaluates load(order) and compares it to old.

(20.2) If the two are not equivalent, returns.

(20.3) Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: Two weak_ptr objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (31.6).

void notify_one() noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (31.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (31.6).

void notify_all() noexcept;

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (31.6) by this call.

Remarks: This function is an atomic notifying operation (31.6).

31.9 Non-member functions

A non-member function template whose name matches the pattern atomic_f or the pattern atomic_f-_explicit invokes the member function f, with the value of the first parameter as the object expression and the values of the remaining parameters (if any) as the arguments of the member function call, in order. An argument for a parameter of type atomic<T>::value_type* is dereferenced when passed to the member function call. If no such member function exists, the program is ill-formed.

[Note: The non-member functions enable programmers to write code that can be compiled as either C or C++, for example in a shared header file. — end note]

31.10 Flag type and operations

namespace std {

    struct atomic_flag {
        constexpr atomic_flag() noexcept;
        atomic_flag(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag&) volatile = delete;

        bool test(memory_order = memory_order::seq_cst) const volatile noexcept;
        bool test(memory_order = memory_order::seq_cst) const noexcept;
        bool test_and_set(memory_order = memory_order::seq_cst) volatile noexcept;
        bool test_and_set(memory_order = memory_order::seq_cst) noexcept;
        void clear(memory_order = memory_order::seq_cst) volatile noexcept;
        void clear(memory_order = memory_order::seq_cst) noexcept;

        void wait(bool, memory_order = memory_order::seq_cst) const volatile noexcept;
        void wait(bool, memory_order = memory_order::seq_cst) const noexcept;
        void notify_one() volatile noexcept;
        void notify_one() noexcept;
        void notify_all() volatile noexcept;
        void notify_all() noexcept;
    };
}

§ 31.10 ©ISO/IEC 2020 – All rights reserved 1548
The atomic_flag type provides the classic test-and-set functionality. It has two states, set and clear.

Operations on an object of type atomic_flag shall be lock-free. [Note: Hence the operations should also be address-free. — end note]

The atomic_flag type is a standard-layout struct. It has a trivial destructor.

```cpp
constexpr atomic_flag::atomic_flag() noexcept;
```

**Effects:** Initializes *this to the clear state.

```cpp
bool atomic_flag_test(const volatile atomic_flag* object) noexcept;
bool atomic_flag_test(const atomic_flag* object) noexcept;
bool atomic_flag_test_explicit(const volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_explicit(const atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const volatile noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const noexcept;
```

**5** For atomic_flag_test, let order be memory_order::seq_cst.

**Preconditions:** order is neither memory_order::release nor memory_order::acq_rel.

**Effects:** Memory is affected according to the value of order.

**Returns:** Atomically returns the value pointed to by object or this.

```cpp
bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) noexcept;
```

**Effects:** Atomically sets the value pointed to by object or this to true. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

**Returns:** Atomically, the value of the object immediately before the effects.

```cpp
void atomic_flag_clear(volatile atomic_flag* object) noexcept;
void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) volatile noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) noexcept;
```

**Preconditions:** The order argument is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.

**Effects:** Atomically sets the value pointed to by object or this to false. Memory is affected according to the value of order.

```cpp
void atomic_flag_wait(const volatile atomic_flag* object, bool old) noexcept;
void atomic_flag_wait(const atomic_flag* object, bool old) noexcept;
void atomic_flag_wait_explicit(const volatile atomic_flag* object, bool old, memory_order order) noexcept;
void atomic_flag_wait_explicit(const atomic_flag* object, bool old, memory_order order) noexcept;
void atomic_flag::wait(bool old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void atomic_flag::wait(bool old, memory_order order = memory_order::seq_cst) const noexcept;
```

**Preconditions:** order is neither memory_order::release nor memory_order::acq_rel.

**Effects:** Repeatedly performs the following steps, in order:

— Evaluates flag->test(order) != old.

§ 31.10 ©ISO/IEC 2020 – All rights reserved
If the result of that evaluation is `true`, returns.

Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

**Remarks:** This function is an atomic waiting operation (31.6).

```c
void atomic_flag_notify_one(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_one(atomic_flag* object) noexcept;
void atomic_flag::notify_one() volatile noexcept;
void atomic_flag::notify_one() noexcept;
```

**Effects:** Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (31.6) by this call, if any such atomic waiting operations exist.

**Remarks:** This function is an atomic notifying operation (31.6).

```c
void atomic_flag_notify_all(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_all(atomic_flag* object) noexcept;
void atomic_flag::notify_all() volatile noexcept;
void atomic_flag::notify_all() noexcept;
```

**Effects:** Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (31.6) by this call.

**Remarks:** This function is an atomic notifying operation (31.6).

### 31.11 Fences

This subclause introduces synchronization primitives called *fences*. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an *acquire fence*. A fence with release semantics is called a *release fence*.

A release fence `A` synchronizes with an acquire fence `B` if there exist atomic operations `X` and `Y`, both operating on some atomic object `M`, such that `A` is sequenced before `X`, `X` modifies `M`, `Y` is sequenced before `B`, and `Y` reads the value written by `X` or a value written by any side effect in the hypothetical release sequence `X` would head if it were a release operation.

A release fence `A` synchronizes with an atomic operation `B` that performs an acquire operation on an atomic object `M` if there exists an atomic operation `X` such that `A` is sequenced before `X`, `X` modifies `M`, and `B` reads the value written by `X` or a value written by any side effect in the hypothetical release sequence `X` would head if it were a release operation.

An atomic operation `A` that is a release operation on an atomic object `M` synchronizes with an acquire fence `B` if there exists some atomic operation `X` on `M` such that `X` is sequenced before `B` and reads the value written by `A` or a value written by any side effect in the release sequence headed by `A`.

```c
extern "C" void atomic_thread_fence(memory_order order) noexcept;
```

**Effects:** Depending on the value of `order`, this operation:

1. has no effects, if `order == memory_order::relaxed`;
2. is an acquire fence, if `order == memory_order::acquire` or `order == memory_order::consume`;
3. is a release fence, if `order == memory_order::release`;
4. is both an acquire fence and a release fence, if `order == memory_order::acq_rel`;
5. is a sequentially consistent acquire and release fence, if `order == memory_order::seq_cst`.

```c
extern "C" void atomic_signal_fence(memory_order order) noexcept;
```

**Effects:** Equivalent to `atomic_thread_fence(order)`, except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.

*[Note: `atomic_signal_fence` can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with `atomic_thread_fence`, but the hardware fence instructions that `atomic_thread_fence` would have inserted are not emitted. — end note]*
32 Thread support library

32.1 General

The following subclauses describe components to create and manage threads (6.9.2), perform mutual exclusion, and communicate conditions and values between threads, as summarized in Table 146.

Table 146: Thread support library summary

32.2 Requirements

32.2.1 Template parameter names

Throughout this Clause, the names of template parameters are used to express type requirements. If a template parameter is named `Predicate`, `operator()` applied to the template argument shall return a value that is convertible to `bool`. If a template parameter is named `Clock`, the corresponding template argument shall be a type `C` for which `is_clock_v<C>` is `true`; otherwise the program is ill-formed.

32.2.2 Exceptions

Some functions described in this Clause are specified to throw exceptions of type `system_error` (19.5.7). Such exceptions are thrown if any of the function’s error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage is reported as described in 16.5.5.13.

[Example: Consider a function in this clause that is specified to throw exceptions of type `system_error` and specifies error conditions that include `operation_not_permitted` for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an `errno` of `EPERM` is reported by a POSIX API call used by the implementation. Since POSIX specifies an `errno` of `EPERM` when “the caller does not have the privilege to perform the operation”, the implementation maps `EPERM` to an `error_condition` of `operation_not_permitted` (19.5) and an exception of type `system_error` is thrown. — end example]

2 The `error_code` reported by such an exception’s `code()` member function compares equal to one of the conditions specified in the function’s error condition element.

32.2.3 Native handles

Several classes described in this Clause have members `native_handle_type` and `native_handle`. The presence of these members and their semantics is implementation-defined. [Note: These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable. — end note]

32.2.4 Timing specifications

Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a `duration` or a `time_point` type as specified in Clause 27.

2 Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a “quality of implementation” delay, expressed as duration $D_i$. Ideally,
this delay would be zero. Further, any contention for processor and memory resources induces a “quality of management” delay, expressed as duration $D_m$. The delay durations may vary from timeout to timeout, but in all cases shorter is better.

3 The functions whose names end in _for take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a steady clock to measure time for these functions.\footnote{All implementations for which standard time units are meaningful must necessarily have a steady clock within their hardware implementation.} Given a duration argument $D_i$, the real-time duration of the timeout is $D_i + D_i + D_m$.

4 The functions whose names end in _until take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument $C_t$, the clock time point of the return from timeout should be $C_t + D_i + D_m$ when the clock is not adjusted during the timeout. If the clock is adjusted to the time $C_n$ during the timeout, the behavior should be as follows:

\[\begin{align*}
\text{(4.1)} & \quad \text{if } C_n > C_t, \text{ the waiting function should wake as soon as possible, i.e., } C_n + D_i + D_m, \text{ since the timeout is already satisfied. This specification may result in the total duration of the wait decreasing when measured against a steady clock.} \\
\text{(4.2)} & \quad \text{if } C_n \leq C_t, \text{ the waiting function should not time out until } \text{Clock}::\text{now()} \text{ returns a time } C_n \geq C_t, \text{ i.e., waking at } C_t + D_i + D_m. \text{ [Note: When the clock is adjusted backwards, this specification can result in the total duration of the wait increasing when measured against a steady clock. When the clock is adjusted forwards, this specification can result in the total duration of the wait decreasing when measured against a steady clock. — end note]}
\end{align*}\]

An implementation returns from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between $C_t$ and the time point of the call to the _until function. \[\text{[Note: Implementations should decrease the duration of the wait when the clock is adjusted forwards. — end note]}\]

5 \[\text{[Note: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, these timeouts might not provide useful functionality. — end note]}\]

6 The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the native resolution.

7 Implementation-provided clocks that are used for these functions meet the Cpp17TrivialClock requirements (27.3).

8 A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as timeout-related exceptions. \[\text{[Note: Instantiations of clock, time point and duration types supplied by the implementation as specified in 27.7 do not throw exceptions. — end note]}\]

32.2.5 Requirements for Cpp17Lockable types \[\text{[thread.req.lockable]}\]

32.2.5.1 In general \[\text{[thread.req.lockable.general]}\]

1 An execution agent is an entity such as a thread that may perform work in parallel with other execution agents. \[\text{[Note: Implementations or users can introduce other kinds of agents such as processes or thread-pool tasks. — end note]}\] The calling agent is determined by context, e.g., the calling thread that contains the call, and so on.

2 \[\text{[Note: Some lockable objects are “agent oblivious” in that they work for any execution agent model because they do not determine or store the agent’s ID (e.g., an ordinary spin lock). — end note]}\]

3 The standard library templates unique_lock (32.5.4.3), shared_lock (32.5.4.4), scoped_lock (32.5.4.2), lock_guard (32.5.4.1), lock, try_lock (32.5.5), and condition_variable_any (32.6.4) all operate on user-supplied lockable objects. The Cpp17BasicLockable requirements, the Cpp17Lockable requirements, and the Cpp17TimedLockable requirements list the requirements imposed by these library types in order to acquire or release ownership of a lock by a given execution agent. \[\text{[Note: The nature of any lock ownership and any synchronization it entails are not part of these requirements. — end note]}\]

32.2.5.2 Cpp17BasicLockable requirements \[\text{[thread.req.lockable.basic]}\]

1 A type L meets the Cpp17BasicLockable requirements if the following expressions are well-formed and have the specified semantics (m denotes a value of type L).

\[\text{§ 32.2.5.2 © ISO/IEC 2020 — All rights reserved 1552}\]
m.lock()

**Effects:** Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

m.unlock()

**Preconditions:** The current execution agent holds a lock on m.

**Effects:** Releases a lock on m held by the current execution agent.

**Throws:** Nothing.

### 32.2.5.3 Cpp17Lockable requirements

A type L meets the Cpp17Lockable requirements if it meets the Cpp17BasicLockable requirements and the following expressions are well-formed and have the specified semantics (m denotes a value of type L).

m.try_lock()

**Effects:** Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

**Return type:** bool.

**Returns:** true if the lock was acquired, false otherwise.

m.try_lock_for(rel_time)

**Effects:** Attempts to acquire a lock for the current execution agent within the relative timeout (32.2.4) specified by rel_time. The function will not return within the timeout specified by rel_time unless it has obtained a lock on m for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

**Return type:** bool.

**Returns:** true if the lock was acquired, false otherwise.

m.try_lock_until(abs_time)

**Effects:** Attempts to acquire a lock for the current execution agent before the absolute timeout (32.2.4) specified by abs_time. The function will not return before the timeout specified by abs_time unless it has obtained a lock on m for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

**Return type:** bool.

**Returns:** true if the lock was acquired, false otherwise.

### 32.3 Stop tokens

#### 32.3.1 Introduction

This clause describes components that can be used to asynchronously request that an operation stops execution in a timely manner, typically because the result is no longer required. Such a request is called a stop request.

Any stop_source, stop_token, and stop_callback implement semantics of shared ownership of a stop state. Any stop_source, stop_token, or stop_callback that shares ownership of the same stop state is an associated stop_source, stop_token, or stop_callback, respectively. The last remaining owner of the stop state automatically releases the resources associated with the stop state.

A stop_token can be passed to an operation which can either

1. (3.1) actively poll the token to check if there has been a stop request, or
2. (3.2) register a callback using the stop_callback class template which will be called in the event that a stop request is made.
A stop request made via a `stop_source` will be visible to all associated `stop_token` and `stop_source` objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

4 Callbacks registered via a `stop_callback` object are called when a stop request is first made by any associated `stop_source` object.

5 Calls to the functions `request_stop`, `stop_requested`, and `stop_possible` do not introduce data races. A call to `request_stop` that returns `true` synchronizes with a call to `stop_requested` on an associated `stop_token` or `stop_source` object that returns `true`. Registration of a callback synchronizes with the invocation of that callback.

32.3.2 Header `<stop_token>` synopsis

```c++
namespace std {
    // 32.3.3, class stop_token
class stop_token;

    // 32.3.4, class stop_source
class stop_source;

    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    }
    inline constexpr nostopstate_t nostopstate{};

    // 32.3.5, class stop_callback
template<class Callback>
class stop_callback;
}
```

32.3.3 Class `stop_token`

1 The class `stop_token` provides an interface for querying whether a stop request has been made (`stop_requested`) or can ever be made (`stop_possible`) using an associated `stop_source` object (32.3.4). A `stop_token` can also be passed to a `stop_callback` (32.3.5) constructor to register a callback to be called when a stop request has been made from an associated `stop_source`.

```c++
namespace std {
    class stop_token {
        public:
            // 32.3.3.1, constructors, copy, and assignment
            stop_token() noexcept;
            stop_token(const stop_token&) noexcept;
            stop_token(stop_token&&) noexcept;
            stop_token& operator=(const stop_token&) noexcept;
            stop_token& operator=(stop_token&&) noexcept;
            ~stop_token();
            void swap(stop_token&) noexcept;

            // 32.3.3.2, stop handling
            [[nodiscard]] bool stop_requested() const noexcept;
            [[nodiscard]] bool stop_possible() const noexcept;

            friend bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
            friend void swap(stop_token& lhs, stop_token& rhs) noexcept;
    }
}
```

32.3.3.1 Constructors, copy, and assignment

1 `stop_token()` is none. `stop_possible()` is `false` and `stop_requested()` is `false`. [Note: Because the created `stop_token` object can never receive a stop request, no resources are allocated for a stop state. —end note]

§ 32.3.3.1 ©ISO/IEC 2020 – All rights reserved 1554
stop_token(const stop_token& rhs) noexcept;
Postconditions: *this == rhs is true. [Note: *this and rhs share the ownership of the same stop state, if any. — end note]

stop_token(stop_token&& rhs) noexcept;
Postconditions: *this contains the value of rhs prior to the start of construction and rhs.stop_possible() is false.

~stop_token();
Effects: Releases ownership of the stop state, if any.

stop_token& operator=(const stop_token& rhs) noexcept;
Effects: Equivalent to: stop_token(rhs).swap(*this).
Returns: *this.

stop_token& operator=(stop_token&& rhs) noexcept;
Effects: Equivalent to: stop_token(std::move(rhs)).swap(*this).
Returns: *this.

void swap(stop_token& rhs) noexcept;
Effects: Exchanges the values of *this and rhs.

32.3.3.2 Members
[[nodiscard]] bool stop_requested() const noexcept;
Returns: true if *this has ownership of a stop state that has received a stop request; otherwise, false.

[[nodiscard]] bool stop_possible() const noexcept;
Returns: false if:
(2.1) *this does not have ownership of a stop state, or
(2.2) a stop request was not made and there are no associated stop_source objects; otherwise, true.

32.3.3.3 Non-member functions
[[nodiscard]] bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
Returns: true if lhs and rhs have ownership of the same stop state or if both lhs and rhs do not have ownership of a stop state; otherwise false.

friend void swap(stop_token& x, stop_token& y) noexcept;
Effects: Equivalent to: x.swap(y).

32.3.4 Class stop_source
The class stop_source implements the semantics of making a stop request. A stop request made on a stop_source object is visible to all associated stop_source and stop_token (32.3.3) objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

namespace std {
    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    };
    inline constexpr nostopstate_t nostopstate{};

class stop_source {
    public:
        // 32.3.4.1, constructors, copy, and assignment
        stop_source();
        explicit stop_source(nostopstate_t) noexcept;
stop_source(const stop_source&) noexcept;
stop_source(stop_source&&) noexcept;
stop_source& operator=(const stop_source&) noexcept;
stop_source& operator=(stop_source&&) noexcept;
~stop_source();
void swap(stop_source&) noexcept;

// 32.3.4.2, stop handling
[[nodiscard]] stop_token get_token() const noexcept;
[[nodiscard]] bool stop_possible() const noexcept;
[[nodiscard]] bool stop_requested() const noexcept;
bool request_stop() noexcept;
[[nodiscard]] friend bool
operator==(const stop_source& lhs, const stop_source& rhs) noexcept;
friend void swap(stop_source& lhs, stop_source& rhs) noexcept;

32.3.4.1 Constructors, copy, and assignment

stop_source();
1
Effects: Initialises *this to have ownership of a new stop state.
2
Postconditions: stop_possible() is true and stop_requested() is false.
3
Throws: bad_alloc if memory could not be allocated for the stop state.

explicit stop_source(nostopstate_t) noexcept;
4
Postconditions: stop_possible() is false and stop_requested() is false. [Note: No resources are allocated for the state. — end note]

stop_source(const stop_source& rhs) noexcept;
5
Postconditions: *this == rhs is true. [Note: *this and rhs share the ownership of the same stop state, if any. — end note]

stop_source(stop_source&& rhs) noexcept;
6
Postconditions: *this contains the value of rhs prior to the start of construction and rhs.stop_possible() is false.

~stop_source();
7
Effects: Releases ownership of the stop state, if any.

stop_source& operator=(const stop_source& rhs) noexcept;
8
Effects: Equivalent to: stop_source(rhs).swap(*this).
9
Returns: *this.

stop_source& operator=(stop_source&& rhs) noexcept;
10
Effects: Equivalent to: stop_source(std::move(rhs)).swap(*this).
11
Returns: *this.

void swap(stop_source& rhs) noexcept;
12
Effects: Exchanges the values of *this and rhs.

32.3.4.2 Members

[[nodiscard]] stop_token get_token() const noexcept;
1
Returns: stop_token() if stop_possible() is false; otherwise a new associated stop_token object.

[[nodiscard]] bool stop_possible() const noexcept;
2
Returns: true if *this has ownership of a stop state; otherwise, false.
[[nodiscard]] bool stop_requested() const noexcept;

Returns: true if *this has ownership of a stop state that has received a stop request; otherwise, false.

bool request_stop() noexcept;

Effects: If *this does not have ownership of a stop state, returns false. Otherwise, atomically determines whether the owned stop state has received a stop request, and if not, makes a stop request. The determination and making of the stop request are an atomic read-modify-write operation (6.9.2.1). If the request was made, the callbacks registered by associated stop_callback objects are synchronously called. If an invocation of a callback exits via an exception then terminate is called (14.6.1). [Note: A stop request includes notifying all condition variables of type condition_variable_any temporarily registered during an interruptible wait (32.6.4.2). — end note]

Postconditions: stop_possible() is false or stop_requested() is true.

Returns: true if this call made a stop request; otherwise false.

32.3.4.3 Non-member functions

[[nodiscard]] friend bool operator==(const stop_source& lhs, const stop_source& rhs) noexcept;

Returns: true if lhs and rhs have ownership of the same stop state or if both lhs and rhs do not have ownership of a stop state; otherwise false.

friend void swap(stop_source& x, stop_source& y) noexcept;

Effects: Equivalent to: x.swap(y).

32.3.5 Class template stop_callback

namespace std {
    template<class Callback>
    class stop_callback {
    public:
        using callback_type = Callback;

        // 32.3.5.1, constructors and destructor
        template<class C>
        explicit stop_callback(const stop_token& st, C&& cb)
        noexcept(is_nothrow_constructible_v<Callback, C>);
        template<class C>
        explicit stop_callback(stop_token&& st, C&& cb)
        noexcept(is_nothrow_constructible_v<Callback, C>);
        ~stop_callback();

        stop_callback(const stop_callback&) = delete;
        stop_callback(stop_callback&&) = delete;
        stop_callback& operator=(const stop_callback&) = delete;
        stop_callback& operator=(stop_callback&&) = delete;

        private:
            Callback callback; // exposition only
        };

    template<class Callback>
    stop_callback(stop_token, Callback) -> stop_callback<Callback>;
}

Mandates: stop_callback is instantiated with an argument for the template parameter Callback that satisfies both invocable and destructible.

Preconditions: stop_callback is instantiated with an argument for the template parameter Callback that models both invocable and destructible.
32.3.5.1 Constructors and destructor

```cpp
template<class C>
explicit stop_callback(const stop_token& st, C&& cb)
    noexcept(is_nothrow_constructible_v<Callback, C>);

template<class C>
explicit stop_callback(stop_token&& st, C&& cb)
    noexcept(is_nothrow_constructible_v<Callback, C>);
```

1 **Constraints:** Callback and C satisfy constructible_from<Callback, C>.

2 **Preconditions:** Callback and C model constructible_from<Callback, C>.

3 **Effects:** Initializes callback with std::forward<C>(cb). If st.stop_requested() is true, then std::forward<Callback>(callback)() is evaluated in the current thread before the constructor returns. Otherwise, if st has ownership of a stop state, acquires shared ownership of that stop state and registers the callback with that stop state such that std::forward<Callback>(callback)() is evaluated by the first call to request_stop() on an associated stop_source.

4 **Remarks:** If evaluating std::forward<Callback>(callback)() exits via an exception, then terminate is called (14.6.1).

5 **Throws:** Any exception thrown by the initialization of callback.

~stop_callback();

6 **Effects:** Unregisters the callback from the owned stop state, if any. The destructor does not block waiting for the execution of another callback registered by an associated stop_callback. If callback is concurrently executing on another thread, then the return from the invocation of callback strongly happens before (6.9.2.1) callback is destroyed. If callback is executing on the current thread, then the destructor does not block (3.6) waiting for the return from the invocation of callback. Releases ownership of the stop state, if any.

---

32.4 Threads

32.4 describes components that can be used to create and manage threads. [Note: These threads are intended to map one-to-one with operating system threads. — end note]

### 32.4.1 Header <thread> synopsis

```cpp
#include <compare>  // see 17.11.1
#include <initializer_list>  // see 17.10.1

namespace std {

    class thread;

    void swap(thread& x, thread& y) noexcept;

    // 32.4.3 class jthread
    class jthread;

    namespace this_thread {
        thread::id get_id() noexcept;
        void yield() noexcept;
        template<class Clock, class Duration>
            void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
        template<class Rep, class Period>
            void sleep_for(const chrono::duration<Rep, Period>& rel_time);
    }
}
```

### 32.4.2 Class thread

The class thread provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A thread object uniquely represents a particular thread of execution. That representation may be transferred to other thread objects in such a way that no two thread objects simultaneously represent the same thread.
of execution. A thread of execution is detached when no thread object represents that thread. Objects of class thread can be in a state that does not represent a thread of execution. [Note: A thread object does not represent a thread of execution after default construction, after being moved from, or after a successful call to detach or join. — end note]

namespace std {
    class thread {
    public:
        // types
        class id;
        using native_handle_type = implementation-defined; // see 32.2.3

        // construct/copy/destroy
        thread() noexcept;
        template<class F, class... Args> explicit thread(F&& f, Args&&... args);
        -thread();
        thread(const thread&) = delete;
        thread(thread&) noexcept;
        thread& operator=(const thread&) = delete;
        thread& operator=(thread&) noexcept;

        // members
        void swap(thread&) noexcept;
        bool joinable() const noexcept;
        void join();
        void detach();
        id get_id() const noexcept;
        native_handle_type native_handle(); // see 32.2.3

        // static members
        static unsigned int hardware_concurrency() noexcept;
    }
}

32.4.2.1 Class thread::id

namespace std {
    class thread::id {
    public:
        id() noexcept;
    }

    bool operator==(thread::id x, thread::id y) noexcept;
    strong_ordering operator<=>(thread::id x, thread::id y) noexcept;

    template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, thread::id id);

    // hash support
    template<class T> struct hash;
    template<> struct hash<thread::id>;
}

1 An object of type thread::id provides a unique identifier for each thread of execution and a single distinct value for all thread objects that do not represent a thread of execution (32.4.2). Each thread of execution has an associated thread::id object that is not equal to the thread::id object of any other thread of execution and that is not equal to the thread::id object of any thread object that does not represent threads of execution.

2 thread::id is a trivially copyable class (11.2). The library may reuse the value of a thread::id of a terminated thread that can no longer be joined.

3 [Note: Relational operators allow thread::id objects to be used as keys in associative containers. — end note]
id() noexcept;

Postconditions: The constructed object does not represent a thread of execution.

bool operator==(thread::id x, thread::id y) noexcept;

Returns: true only if x and y represent the same thread of execution or neither x nor y represents a thread of execution.

strong_ordering operator<=>(thread::id x, thread::id y) noexcept;

Let \( P(x, y) \) be an unspecified total ordering over thread::id as described in 25.8.

Returns: strong_ordering::less if \( P(x, y) \) is true. Otherwise, strong_ordering::greater if \( P(y, x) \) is true. Otherwise, strong_ordering::equal.

template<class charT, class traits>

basic_ostream<charT, traits>&

operator<<(basic_ostream<charT, traits>& out, thread::id id);

Effects: Inserts an unspecified text representation of id into out. For two objects of type thread::id x and y, if x == y the thread::id objects have the same text representation and if x != y the thread::id objects have distinct text representations.

Returns: out.

template<> struct hash<thread::id>;

The specialization is enabled (20.14.18).

32.4.2.2 Constructors [thread.thread.constr]

thread() noexcept;

Effects: The object does not represent a thread of execution.

Postconditions: get_id() == id().

template<class F, class... Args> explicit thread(F&& f, Args&&... args);

Constraints: remove_cvref_t<F> is not the same type as thread.

Mandates: The following are all true:

(4.1) — is_constructible_v<decay_t<F>, F>,
(4.2) — (is_constructible_v<decay_t<Args>, Args>&& ...),
(4.3) — is_move_constructible_v<decay_t<F>>,
(4.4) — (is_move_constructible_v<decay_t<Args>&& ...), and
(4.5) — is_invocable_v<decay_t<F>, decay_t<Args>...>.

Preconditions: decay_t<F> and each type in decay_t<Args> meet the Cpp17MoveConstructible requirements.

Effects: The new thread of execution executes

\[
\text{invoke}(\text{decay-copy}(std::forward<F>(f)), \text{decay-copy}(std::forward<Args>(args)))...
\]

with the calls to \text{decay-copy} being evaluated in the constructing thread. Any return value from this invocation is ignored. [Note: This implies that any exceptions not thrown from the invocation of the copy of f will be thrown in the constructing thread, not the new thread. — end note] If the invocation of \text{invoke} terminates with an uncaught exception, \text{terminate} is called.

Synchronization: The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of f.

Postconditions: get_id() != id(). *this represents the newly started thread.

Throws: system_error if unable to start the new thread.

Error conditions:

(10.1) — resource_unavailable_try_again — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.
thread(thread&& x) noexcept;

postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the start of construction.

32.4.2.3 Destructor

~thread();

effects: if joinable(), calls terminate(). otherwise, has no effects. [note: Either implicitly detaching or joining a joinable() thread in its destructor could result in difficult to debug correctness (for detach) or performance (for join) bugs encountered only when an exception is thrown. Thus the programmer must ensure that the destructor is never executed while the thread is still joinable. — end note]

32.4.2.4 Assignment

thread& operator=(thread&& x) noexcept;

effects: if joinable(), calls terminate(). otherwise, assigns the state of x to *this and sets x to a default constructed state.

postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the assignment.

returns: *this.

32.4.2.5 Members

void swap(thread& x) noexcept;

effects: swaps the state of *this and x.

bool joinable() const noexcept;

returns: get_id() != id().

void join();

effects: blocks until the thread represented by *this has completed.

synchronization: the completion of the thread represented by *this synchronizes with (6.9.2) the corresponding successful join() return. [note: operations on *this are not synchronized. — end note]

postconditions: the thread represented by *this has completed. get_id() == id().

throws: system_error when an exception is required (32.2.2).

error conditions:
(7.1) — resource_deadlock_would_occur — if deadlock is detected or get_id() == this_thread::get_id().
(7.2) — no_such_process — if the thread is not valid.
(7.3) — invalid_argument — if the thread is not joinable.

void detach();

effects: the thread represented by *this continues execution without the calling thread blocking. when detach() returns, *this no longer represents the possibly continuing thread of execution. when the thread previously represented by *this ends execution, the implementation releases any owned resources.

postconditions: get_id() == id().

throws: system_error when an exception is required (32.2.2).

error conditions:
(11.1) — no_such_process — if the thread is not valid.
(11.2) — invalid_argument — if the thread is not joinable.
id get_id() const noexcept;

12  Returns: A default constructed id object if *this does not represent a thread, otherwise this_thread::get_id() for the thread of execution represented by *this.

### 32.4.2.6 Static members

unsigned hardware_concurrency() noexcept;

1  Returns: The number of hardware thread contexts. [Note: This value should only be considered to be a hint. — end note] If this value is not computable or well-defined, an implementation should return 0.

### 32.4.2.7 Specialized algorithms

void swap(thread& x, thread& y) noexcept;

1  Effects: As if by x.swap(y).

### 32.4.3 Class jthread

The class jthread provides a mechanism to create a new thread of execution. The functionality is the same as for class thread ([32.4.2]) with the additional abilities to provide a stop_token ([32.3]) to the new thread of execution, make stop requests, and automatically join.

namespace std {

class jthread {
public:

    // types
    using id = thread::id;
    using native_handle_type = thread::native_handle_type;

    // 32.4.3.1, constructors, move, and assignment
    jthread() noexcept;
    template<class F, class... Args> explicit jthread(F&& f, Args&&... args);
    ~jthread();
    jthread(const jthread&) = delete;
    jthread(jthread&&) noexcept;
    jthread& operator=(const jthread&) = delete;
    jthread& operator=(jthread&&) noexcept;

    // 32.4.3.2, members
    void swap(jthread&) noexcept;
    [[nodiscard]] bool joinable() const noexcept;
    void join();
    void detach();
    [[nodiscard]] id get_id() const noexcept;
    [[nodiscard]] native_handle_type native_handle();  // see 32.2.3

    // 32.4.3.3, stop token handling
    [[nodiscard]] stop_source get_stop_source() noexcept;
    [[nodiscard]] stop_token get_stop_token() const noexcept;
    bool request_stop() noexcept;

    // 32.4.3.4, specialized algorithms
    friend void swap(jthread& lhs, jthread& rhs) noexcept;

    // 32.4.3.5, static members
    [[nodiscard]] static unsigned int hardware_concurrency() noexcept;

private:
    stop_source ssourse;  // exposition only
};
}
32.4.3.1 Constructors, move, and assignment

jthread() noexcept;

Effects: Constructs a jthread object that does not represent a thread of execution.

Postconditions: get_id() == id() is true and ssOURCE.stop_possible() is false.

template<class F, class... Args> explicit jthread(F&& f, Args&&... args);

Constraints: remove_cvref_t<F> is not the same type as jthread.

Mandates: The following are all true:

(4.1) is_constructible_v<decay_t<F>, F>,
(4.2) (is_constructible_v<decay_t<Args>, Args> && ...),
(4.3) is_move_constructible_v<decay_t<F>>,
(4.4) (is_move_constructible_v<decay_t<Args>> && ...), and
(4.5) is_invocable_v<decay_t<F>, decay_t<Args>... ||
        is_invocable_v<decay_t<F>, stop_token, decay_t<Args>...>.

Preconditions: decay_t<F> and each type in decay_t<Args> meet the Cpp17MoveConstructible requirements.

Effects: Initializes ssOURCE. The new thread of execution executes

invoke(decay-copy(std::forward<F>(f)), get_stop_token(),
        decay-copy(std::forward<Args>(args))...)

if that expression is well-formed, otherwise

invoke(decay-copy(std::forward<F>(f)), decay-copy(std::forward<Args>(args))...)

with the calls to decay-copy being evaluated in the constructing thread. Any return value from this
invocation is ignored. [Note: This implies that any exceptions not thrown from the invocation of the
copy of f will be thrown in the constructing thread, not the new thread. —end note] If the invoke
expression exits via an exception, terminate is called.

Synchronization: The completion of the invocation of the constructor synchronizes with the beginning
of the invocation of the copy of f.

Postconditions: get_id() != id() is true and ssOURCE.stop_possible() is true and *this
represents the newly started thread. [Note: The calling thread can make a stop request only once, because
it cannot replace this stop token. —end note] If the invoke
expression exits via an exception, terminate is called.

Throws: system_error if unable to start the new thread.

Error conditions:

(10.1) resource_unavailable_try_again — the system lacked the necessary resources to create another
thread, or the system-imposed limit on the number of threads in a process would be exceeded.

jthread(jthread&& x) noexcept;

Postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the
start of construction. ssOURCE has the value of x.ssOURCE prior to the start of construction and
x.ssOURCE.stop_possible() is false.

~jthread();

Effects: If joinable() is true, calls request_stop() and then join(). [Note: Operations on *this
are not synchronized. —end note]

jthread& operator=(jthread&& x) noexcept;

Effects: If joinable() is true, calls request_stop() and then join(). Assigns the state of x to
*this and sets x to a default constructed state.

Postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the
assignment. ssOURCE has the value of x.ssOURCE prior to the assignment and x.ssOURCE.stop_possible() is false.

Returns: *this.
32.4.3.2 Members

void swap(jthread& x) noexcept;

*Effects:* Exchanges the values of *this* and x.

[[nodiscard]] bool joinable() const noexcept;

*Returns:* get_id() != id().

void join();

*Effects:* Blocks until the thread represented by *this* has completed.

*Synchronization:* The completion of the thread represented by *this* synchronizes with (6.9.2) the corresponding successful join() return. [Note: Operations on *this* are not synchronized. — end note]

*Postconditions:* The thread represented by *this* has completed. get_id() == id().

Throws: system_error when an exception is required (32.2.2).

Error conditions:

— resource_deadlock_would_occur — if deadlock is detected or get_id() == this_thread::get_id().
— no_such_process — if the thread is not valid.
— invalid_argument — if the thread is not joinable.

void detach();

*Effects:* The thread represented by *this* continues execution without the calling thread blocking. When detach() returns, *this* no longer represents the possibly continuing thread of execution. When the thread previously represented by *this* ends execution, the implementation releases any owned resources.

*Postconditions:* get_id() == id().

Throws: system_error when an exception is required (32.2.2).

Error conditions:

— no_such_process — if the thread is not valid.
— invalid_argument — if the thread is not joinable.

id get_id() const noexcept;

*Returns:* A default constructed id object if *this* does not represent a thread, otherwise this_thread::get_id() for the thread of execution represented by *this*.

32.4.3.3 Stop token handling

[[nodiscard]] stop_source get_stop_source() noexcept;

*Effects:* Equivalent to: return ssoure;

[[nodiscard]] stop_token get_stop_token() const noexcept;

*Effects:* Equivalent to: return ssoure.get_token();

bool request_stop() noexcept;

*Effects:* Equivalent to: return ssoure.request_stop();

32.4.3.4 Specialized algorithms

friend void swap(jthread& x, jthread& y) noexcept;

*Effects:* Equivalent to: x.swap(y).

32.4.3.5 Static members

[[nodiscard]] static unsigned int hardware_concurrency() noexcept;

*Returns:* thread::hardware_concurrency().
32.4.4 Namespace this_thread

```cpp
namespace std::this_thread {
    thread::id get_id() noexcept;

    void yield() noexcept;
    template<class Clock, class Duration>
        void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
        void sleep_for(const chrono::duration<Rep, Period>& rel_time);
}
```

1 Returns: An object of type thread::id that uniquely identifies the current thread of execution. No other thread of execution has this id and this thread of execution always has this id. The object returned does not compare equal to a default constructed thread::id.

```cpp
void this_thread::yield() noexcept;
```

2 Effects: Offers the implementation the opportunity to reschedule.

3 Synchronization: None.

```cpp
template<class Clock, class Duration>
    void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
```

4 Effects: Blocks the calling thread for the absolute timeout (32.2.4) specified by abs_time.

5 Synchronization: None.

6 Throws: Timeout-related exceptions (32.2.4).

```cpp
template<class Rep, class Period>
    void sleep_for(const chrono::duration<Rep, Period>& rel_time);
```

7 Effects: Blocks the calling thread for the relative timeout (32.2.4) specified by rel_time.

8 Synchronization: None.

9 Throws: Timeout-related exceptions (32.2.4).

32.5 Mutual exclusion

This subclause provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.9.2).

32.5.1 Header <mutex> synopsis

```cpp
namespace std {
    class mutex;
    class recursive_mutex;
    class timed_mutex;
    class recursive_timed_mutex;
    struct defer_lock_t { explicit defer_lock_t() = default; };
    struct try_to_lock_t { explicit try_to_lock_t() = default; };
    struct adopt_lock_t { explicit adopt_lock_t() = default; };

    inline constexpr defer_lock_t defer_lock { };
    inline constexpr try_to_lock_t try_to_lock { };
    inline constexpr adopt_lock_t adopt_lock { };

    template<class Mutex> class lock_guard;
    template<class… MutexTypes> class scoped_lock;
    template<class Mutex> class unique_lock;

    template<class Mutex>
        void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
}
```
template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

struct once_flag;

template<class Callable, class... Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);

32.5.2 Header <shared_mutex> synopsis

namespace std {
    class shared_mutex;
    class shared_timed_mutex;
    template<class Mutex> class shared_lock;
    template<class Mutex>
    void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}

32.5.3 Mutex requirements

32.5.3.1 In general

A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (32.2.5). An execution agent owns a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

32.5.3.2 Mutex types

The mutex types are the standard library types mutex, recursive_mutex, timed_mutex, recursive_timed_mutex, shared_mutex, and shared_timed_mutex. They meet the requirements set out in this subclause. In this description, m denotes an object of a mutex type.

The mutex types meet the Cpp17Lockable requirements (32.2.5.3).

The mutex types meet Cpp17DefaultConstructible and Cpp17Destructible. If initialization of an object of a mutex type fails, an exception of type system_error is thrown. The mutex types are neither copyable nor movable.

The error conditions for error codes, if any, reported by member functions of the mutex types are as follows:

- resource_unavailable_try_again — if any native handle type manipulated is not available.
- operation_not_permitted — if the thread does not have the privilege to perform the operation.
- invalid_argument — if any native handle type manipulated as part of mutex construction is incorrect.

The implementation provides lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (6.9.2). The lock and unlock operations on a single mutex appear to occur in a single total order. [Note: This can be viewed as the modification order (6.9.2) of the mutex. — end note] [Note: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization should be used to ensure that mutex objects are initialized and visible to other threads. — end note]

The expression m.lock() is well-formed and has the following semantics:

Preconditions: If m is of type mutex, timed_mutex, shared_mutex, or shared_timed_mutex, the calling thread does not own the mutex.

Effects: Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.

Postconditions: The calling thread owns the mutex.

Return type: void.

Synchronization: Prior unlock() operations on the same object synchronize with (6.9.2) this operation.

Throws: system_error when an exception is required (32.2.2).

Error conditions:

- operation_not_permitted — if the thread does not have the privilege to perform the operation.
The expression \( m \).try_lock() is well-formed and has the following semantics:

- **Preconditions:** If \( m \) is of type mutex, timed_mutex, shared_mutex, or shared_timed_mutex, the calling thread does not own the mutex.

- **Effects:** Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and try_lock() immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread. [Note: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (Clause 31). — end note] An implementation should ensure that try_lock() does not consistently return false in the absence of contending mutex acquisitions.

  **Return type:** bool.

  **Returns:** true if ownership of the mutex was obtained for the calling thread, otherwise false.

  **Synchronization:** If try_lock() returns true, prior unlock() operations on the same object synchronize with (6.9.2) this operation. [Note: Since lock() does not synchronize with a failed subsequent try_lock(), the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures. — end note]

  **Throws:** Nothing.

The expression \( m \).unlock() is well-formed and has the following semantics:

- **Preconditions:** The calling thread owns the mutex.

- **Effects:** Releases the calling thread’s ownership of the mutex.

- **Return type:** void.

- **Synchronization:** This operation synchronizes with (6.9.2) subsequent lock operations that obtain ownership on the same object.

- **Throws:** Nothing.

### 32.5.3.2.1 Class mutex

```cpp
namespace std {
  class mutex {
    public:
      constexpr mutex() noexcept;
      ~mutex();
      mutex(const mutex&) = delete;
      mutex& operator=(const mutex&) = delete;
      void lock();
      bool try_lock();
      void unlock();
      using native_handle_type = implementation-defined; // see 32.2.3
      native_handle_type native_handle(); // see 32.2.3
    }
  }
}
```

1 The class mutex provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a mutex object, attempts by another thread to acquire ownership of that object will fail (for try_lock()) or block (for lock()) until the owning thread has released ownership with a call to unlock().

2 [Note: After a thread \( A \) has called unlock(), releasing a mutex, it is possible for another thread \( B \) to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread \( A \) appears to have returned from its unlock call. Implementations are required to handle such scenarios correctly, as long as thread \( A \) doesn’t access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. — end note]

3 The class mutex meets all of the mutex requirements (32.5.3). It is a standard-layout class (11.2).
4 [Note: A program can deadlock if the thread that owns a mutex object calls \texttt{lock()} on that object. If the implementation can detect the deadlock, a \texttt{resource\_deadlock\_would\_occur} error condition might be observed. — end note]

5 The behavior of a program is undefined if it destroys a mutex object owned by any thread or a thread terminates while owning a mutex object.

32.5.3.2.2 Class \texttt{recursive\_mutex} 

```cpp
namespace std {
  class recursive_mutex {
    public:
      recursive_mutex();
      ~recursive_mutex();
      recursive_mutex(const recursive_mutex&) = delete;
      recursive_mutex& operator=(const recursive_mutex&) = delete;
      void lock();
      bool try_lock() noexcept;
      void unlock();

      using native_handle_type = implementation-defined;  // see 32.2.3
      native_handle_type native_handle();  // see 32.2.3
  };
}
```

1 The class \texttt{recursive\_mutex} provides a recursive mutex with exclusive ownership semantics. If one thread owns a \texttt{recursive\_mutex} object, attempts by another thread to acquire ownership of that object will fail (for \texttt{try\_lock()}) or block (for \texttt{lock()}) until the first thread has completely released ownership.

2 The class \texttt{recursive\_mutex} meets all of the mutex requirements (32.5.3). It is a standard-layout class (11.2).

3 A thread that owns a \texttt{recursive\_mutex} object may acquire additional levels of ownership by calling \texttt{lock()} or \texttt{try\_lock()} on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a \texttt{recursive\_mutex} object, additional calls to \texttt{try\_lock()} fail, and additional calls to \texttt{lock()} throw an exception of type \texttt{system\_error}. A thread shall call \texttt{unlock()} once for each level of ownership acquired by calls to \texttt{lock()} and \texttt{try\_lock()}. Only when all levels of ownership have been released may ownership be acquired by another thread.

4 The behavior of a program is undefined if:

(4.1) it destroys a \texttt{recursive\_mutex} object owned by any thread or

(4.2) a thread terminates while owning a \texttt{recursive\_mutex} object.

32.5.3.3 Timed mutex types

1 The timed mutex types are the standard library types \texttt{timed\_mutex}, \texttt{recursive\_timed\_mutex}, and \texttt{shared\_timed\_mutex}. They meet the requirements set out below. In this description, \texttt{m} denotes an object of a mutex type, \texttt{rel\_time} denotes an object of an instantiation of \texttt{duration} (27.5), and \texttt{abs\_time} denotes an object of an instantiation of \texttt{time\_point} (27.6).

2 The timed mutex types meet the \texttt{Cpp17TimedLockable} requirements (32.2.5.4).

3 The expression \texttt{m\_try\_lock\_for(rel\_time)} is well-formed and has the following semantics:

4 \textbf{Preconditions}: If \texttt{m} is of type \texttt{timed\_mutex} or \texttt{shared\_timed\_mutex}, the calling thread does not own the mutex.

5 \textbf{Effects}: The function attempts to obtain ownership of the mutex within the relative timeout (32.2.4) specified by \texttt{rel\_time}. If the time specified by \texttt{rel\_time} is less than or equal to \texttt{rel\_time\_zero()}, the function attempts to obtain ownership without blocking (as if by calling \texttt{try\_lock()}). The function returns within the timeout specified by \texttt{rel\_time} only if it has obtained ownership of the mutex object. [Note: As with \texttt{try\_lock()}, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

6 \textbf{Return type}: \texttt{bool}.

7 \textbf{Returns}: \texttt{true} if ownership was obtained, otherwise \texttt{false}.
Synchronization: If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

Throws: Timeout-related exceptions (32.2.4).

The expression `m.try_lock_until(abs_time)` is well-formed and has the following semantics:

Preconditions: If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

Effects: The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns before the absolute timeout (32.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object. [Note: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

Return type: `bool`.

Returns: `true` if ownership was obtained, otherwise `false`.

Synchronization: If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

Throws: Timeout-related exceptions (32.2.4).

### 32.5.3.3.1 Class `timed_mutex` [thread.timedmutex.class]

```cpp
namespace std {
    class timed_mutex {
        public:
            timed_mutex();
            ~timed_mutex();
            timed_mutex(const timed_mutex&) = delete;
            timed_mutex& operator=(const timed_mutex&) = delete;
            void lock(); // blocking
            bool try_lock();
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock();

            using native_handle_type = implementation-defined; // see 32.2.3
            native_handle_type native_handle(); // see 32.2.3
    }
}
```

1 The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()` or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has released ownership with a call to `unlock()` or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

2 The class `timed_mutex` meets all of the timed mutex requirements (32.5.3.3). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if:

- itdestroys a `timed_mutex` object owned by any thread,
- a thread that owns a `timed_mutex` object calls `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object, or
- a thread terminates while owning a `timed_mutex` object.

### 32.5.3.3.2 Class `recursive_timed_mutex` [thread.timedmutex.recursive]

```cpp
namespace std {
    class recursive_timed_mutex {
        public:

§ 32.5.3.3.2 ©ISO/IEC 2020 – All rights reserved 1569
```
The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has completely released ownership or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

A thread that owns a `recursive_timed_mutex` object may acquire additional levels of ownership by calling `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_timed_mutex` object, additional calls to `try_lock()`, `try_lock_for()`, or `try_lock_until()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()`, `try_lock()`, `try_lock_for()`, and `try_lock_until()`. Only when all levels of ownership have been released may ownership of the object be acquired by another thread.

The behavior of a program is undefined if:

1. it destroys a `recursive_timed_mutex` object owned by any thread, or
2. a thread terminates while owning a `recursive_timed_mutex` object.

### 32.5.3.4 Shared mutex types

The standard library types `shared_mutex` and `shared_timed_mutex` are shared mutex types. Shared mutex types meet the requirements of mutex types (32.5.3.2) and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared mutex type.

In addition to the exclusive lock ownership mode specified in 32.5.3.2, shared mutex types provide a shared lock ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent holds a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but is at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.

The expression `m.lock_shared()` is well-formed and has the following semantics:

1. **Preconditions:** The calling thread has no ownership of the mutex.
2. **Effects:** Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock has not been acquired for the current thread.
3. **Postconditions:** The calling thread has a shared lock on the mutex.

**Return type:** `void`. 
Synchronization: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

Throws: `system_error` when an exception is required (32.2.2).

Error conditions:

- `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

The expression `m.unlock_shared()` is well-formed and has the following semantics:

- **Preconditions:** The calling thread holds a shared lock on the mutex.
- **Effects:** Releases a shared lock on the mutex held by the calling thread.
- **Return type:** `void`.
- **Synchronization:** This operation synchronizes with (6.9.2) subsequent `lock()` operations that obtain ownership on the same object.

Throws: Nothing.

The expression `m.try_lock_shared()` is well-formed and has the following semantics:

- **Preconditions:** The calling thread has no ownership of the mutex.
- **Effects:** Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try_lock_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.
- **Return type:** `bool`.
- **Returns:** `true` if the shared ownership lock was acquired, `false` otherwise.
- **Synchronization:** If `try_lock_shared()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

Throws: Nothing.

### Class shared_mutex

```cpp
namespace std {
    class shared_mutex {
        public:
            shared_mutex();
            ~shared_mutex();

            shared_mutex(const shared_mutex&) = delete;
            shared_mutex& operator=(const shared_mutex&) = delete;

            // exclusive ownership
            void lock();                  // blocking
            bool try_lock();
            void unlock();

            // shared ownership
            void lock_shared();           // blocking
            bool try_lock_shared();
            void unlock_shared();

            using native_handle_type = implementation-defined;    // see 32.2.3
            native_handle_type native_handle();                   // see 32.2.3
        }
    }
}
```

1. The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.
2. The class `shared_mutex` meets all of the shared mutex requirements (32.5.3.4). It is a standard-layout class (11.2).
3. The behavior of a program is undefined if:
   
   - it destroys a `shared_mutex` object owned by any thread,
   - a thread attempts to recursively gain any ownership of a `shared_mutex`, or
— a thread terminates while possessing any ownership of a `shared_mutex`.

`shared_mutex` may be a synonym for `shared_timed_mutex`.

### 32.5.3.5 Shared timed mutex types

The standard library type `shared_timed_mutex` is a *shared timed mutex type*. Shared timed mutex types meet the requirements of timed mutex types (32.5.3.3), shared mutex types (32.5.3.4), and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_type` denotes an object of an instantiation of `duration` (27.5), and `abs_time` denotes an object of an instantiation of `time_point` (27.6).

The expression `m.try_lock_shared_for(rel_time)` is well-formed and has the following semantics:

1. **Preconditions:** The calling thread has no ownership of the mutex.
2. **Effects:** Attempts to obtain shared lock ownership for the calling thread within the relative timeout (32.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time::zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_shared()`). The function returns within the timeout specified by `rel_time` only if it has obtained shared ownership of the mutex object. [Note: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note] If an exception is thrown then a shared lock has not been acquired for the current thread.
3. **Return type:** bool.
4. **Returns:** true if the shared lock was acquired, false otherwise.
5. **Synchronization:** If `try_lock_shared_for()` returns true, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
6. **Throws:** Timeout-related exceptions (32.2.4).

The expression `m.try_lock_shared_until(abs_time)` is well-formed and has the following semantics:

1. **Preconditions:** The calling thread has no ownership of the mutex.
2. **Effects:** The function attempts to obtain shared ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain shared ownership without blocking (as if by calling `try_lock_shared()`). The function returns before the absolute timeout (32.2.4) specified by `abs_time` only if it has obtained shared ownership of the mutex object. [Note: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note] If an exception is thrown then a shared lock has not been acquired for the current thread.
3. **Return type:** bool.
4. **Returns:** true if the shared lock was acquired, false otherwise.
5. **Synchronization:** If `try_lock_shared_until()` returns true, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
6. **Throws:** Timeout-related exceptions (32.2.4).

### 32.5.3.5.1 Class `shared_timed_mutex`  

```cpp
namespace std {
    class shared_timed_mutex {
    public:
        shared_timed_mutex();
        ~shared_timed_mutex();

        shared_timed_mutex(const shared_timed_mutex&) = delete;
        shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

        // exclusive ownership
        void lock(); // blocking
        bool try_lock();

        template<typename Rep, typename Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    }  

    namespace chronic {  
        template<typename Rep, typename Period>
        bool try_lock_for(constchrono::duration<Rep, Period>& rel_time);
    }
}
```
template<class Clock, class Duration>
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
void unlock();

    // shared ownership
    void lock_shared();    // blocking
    bool try_lock_shared();
    template<class Rep, class Period>
    bool try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
    bool try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
void unlock_shared();
};

1 The class shared_timed_mutex provides a non-recursive mutex with shared ownership semantics.

2 The class shared_timed_mutex meets all of the shared timed mutex requirements (32.5.3.5). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if:

   — it destroys a shared_timed_mutex object owned by any thread,
   — a thread attempts to recursively gain any ownership of a shared_timed_mutex, or
   — a thread terminates while possessing any ownership of a shared_timed_mutex.

32.5.4 Locks [thread.lock]

1 A lock is an object that holds a reference to a lockable object and may unlock the lockable object during the lock’s destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to own a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references. [Note: Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — end note]

2 Some lock constructors take tag types which describe what should be done with the lockable object during the lock’s construction.

namespace std {
    struct defer_lock_t { };    // do not acquire ownership of the mutex
    struct try_to_lock_t { };    // try to acquire ownership of the mutex
        // without blocking
    struct adopt_lock_t { };    // assume the calling thread has already
        // obtained mutex ownership and manage it

    inline constexpr defer_lock_t defer_lock { };
    inline constexpr try_to_lock_t try_to_lock { };    
    inline constexpr adopt_lock_t adopt_lock { };    
}

32.5.4.1 Class template lock_guard [thread.lock.guard]

namespace std {
    template<class Mutex>
    class lock_guard {
public:
        using mutex_type = Mutex;

        explicit lock_guard(mutex_type& m);
        lock_guard(mutex_type& m, adopt_lock_t);
        -lock_guard();

        lock_guard(const lock_guard&) = delete;
        lock_guard& operator=(const lock_guard&) = delete;
};
An object of type `lock_guard` controls the ownership of a lockable object within a scope. A `lock_guard` object maintains ownership of a lockable object throughout the `lock_guard` object’s lifetime (6.7.3). The behavior of a program is undefined if the lockable object referenced by `pm` does not exist for the entire lifetime of the `lock_guard` object. The supplied `Mutex` type shall meet the `Cpp17BasicLockable` requirements (32.2.5.2).

```cpp
explicit lock_guard(mutex_type& m);
```

2. **Preconditions:** If `mutex_type` is not a recursive mutex, the calling thread does not own the mutex `m`.

3. **Effects:** Initializes `pm` with `m`. Calls `m.lock()`.

```cpp
lock_guard(mutex_type& m, adopt_lock_t);
```

4. **Preconditions:** The calling thread owns the mutex `m`.

5. **Effects:** Initializes `pm` with `m`.

6. **Throws:** Nothing.

```cpp
~lock_guard();
```

7. **Effects:** As if by `pm.unlock()`.

### 32.5.4.2 Class template `scoped_lock` [thread.lock.scoped]

```cpp
namespace std {
    template<class... MutexTypes>
    class scoped_lock {
        public:
            using mutex_type = Mutex; // If MutexTypes... consists of the single type Mutex
            explicit scoped_lock(MutexTypes&... m);
            explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
            ~scoped_lock();

            scoped_lock(const scoped_lock&) = delete;
            scoped_lock& operator=(const scoped_lock&) = delete;

        private:
            tuple<MutexTypes&...> pm; // exposition only
        };
    }
```

An object of type `scoped_lock` controls the ownership of lockable objects within a scope. A `scoped_lock` object maintains ownership of lockable objects throughout the `scoped_lock` object’s lifetime (6.7.3). The behavior of a program is undefined if the lockable objects referenced by `pm` do not exist for the entire lifetime of the `scoped_lock` object. When `sizeof...(MutexTypes)` is 1, the supplied `Mutex` type shall meet the `Cpp17BasicLockable` requirements (32.2.5.2). Otherwise, each of the mutex types shall meet the `Cpp17Lockable` requirements (32.2.5.3).

```cpp
explicit scoped_lock(MutexTypes&... m);
```

2. **Preconditions:** If a `MutexTypes` type is not a recursive mutex, the calling thread does not own the corresponding mutex element of `m`.

3. **Effects:** Initializes `pm` with `tie(m...)`. Then if `sizeof...(MutexTypes)` is 0, no effects. Otherwise if `sizeof...(MutexTypes)` is 1, then `m.lock()`. Otherwise, `lock(m...)`.

```cpp
explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
```

4. **Preconditions:** The calling thread owns all the mutexes in `m`.

5. **Effects:** Initializes `pm` with `tie(m...)`.

6. **Throws:** Nothing.
~scoped_lock();

Effects: For all i in [0, sizeof...(MutexTypes)), get<i>(pm).unlock().

32.5.4.3 Class template unique_lock

namespace std {

    template<class Mutex>
    class unique_lock {
        public:
            using mutex_type = Mutex;

            // 32.5.4.3.1, construct/copy/destroy
            unique_lock() noexcept;
            explicit unique_lock(mutex_type& m);
            unique_lock(mutex_type& m, defer_lock_t) noexcept;
            unique_lock(mutex_type& m, try_to_lock_t);
            unique_lock(mutex_type& m, adopt_lock_t);
            template<class Clock, class Duration>
                unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
            template<class Rep, class Period>
                unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
            ~unique_lock();

            unique_lock(const unique_lock&) = delete;
            unique_lock& operator=(const unique_lock&) = delete;

            unique_lock(unique_lock&& u) noexcept;
            unique_lock& operator=(unique_lock&& u);

            // 32.5.4.3.2, locking
            void lock();
            bool try_lock();

            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock();

            // 32.5.4.3.3, modifiers
            void swap(unique_lock& x) noexcept;
            mutex_type* release() noexcept;

            // 32.5.4.3.4, observers
            bool owns_lock() const noexcept;
            explicit operator bool () const noexcept;
            mutex_type* mutex() const noexcept;

        private:
            mutex_type* pm; // exposition only
            bool owns; // exposition only
    };

    template<class Mutex>
        void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
}

An object of type unique_lock controls the ownership of a lockable object within a scope. Ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another unique_lock object. Objects of type unique_lock are not copyable but are movable. The behavior of a program is undefined if the contained pointer pm is not null and the lockable object pointed to by pm does not exist for the entire remaining lifetime (6.7.3) of the unique_lock object. The supplied Mutex type shall meet the Cpp17BasicLockable requirements (32.2.5.2).
Note: unique_lock<Mutex> meets the Cpp17BasicLockable requirements. If Mutex meets the Cpp17Lockable requirements (32.2.5.3), unique_lock<Mutex> also meets the Cpp17Lockable requirements; if Mutex meets the Cpp17TimedLockable requirements (32.2.5.4), unique_lock<Mutex> also meets the Cpp17TimedLockable requirements. —end note

32.5.4.3.1 Constructors, destructor, and assignment

unique_lock() noexcept;
Postconditions: pm == 0 and owns == false.

explicit unique_lock(mutex_type& m);
Preconditions: If mutex_type is not a recursive mutex the calling thread does not own the mutex.
Effects: Calls m.lock().
Postconditions: pm == addressof(m) and owns == true.

unique_lock(mutex_type& m, defer_lock_t) noexcept;
Postconditions: pm == addressof(m) and owns == false.

unique_lock(mutex_type& m, try_to_lock_t);
Preconditions: The supplied Mutex type meets the Cpp17Lockable requirements (32.2.5.3). If mutex_type is not a recursive mutex the calling thread does not own the mutex.
Effects: Calls m.try_lock().
Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock().

unique_lock(mutex_type& m, adopt_lock_t);
Preconditions: The calling thread owns the mutex.
Postconditions: pm == addressof(m) and owns == true.
Throws: Nothing.

template<class Clock, class Duration>
unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
Preconditions: If mutex_type is not a recursive mutex the calling thread does not own the mutex. The supplied Mutex type meets the Cpp17TimedLockable requirements (32.2.5.4).
Effects: Calls m.try_lock_until(abs_time).
Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock_until(abs_time).

template<class Rep, class Period>
unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
Preconditions: If mutex_type is not a recursive mutex the calling thread does not own the mutex. The supplied Mutex type meets the Cpp17TimedLockable requirements (32.2.5.4).
Effects: Calls m.try_lock_for(rel_time).
Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock_for(rel_time).

unique_lock(unique_lock&& u) noexcept;
Postconditions: pm == u.p.pm and owns == u.p.owns (where u.p is the state of u just prior to this construction), u.pm == 0 and u.owns == false.

unique_lock& operator=(unique_lock&& u);
Effects: If owns calls pm->unlock()..
Postconditions: pm == u.p.pm and owns == u.p.owns (where u.p is the state of u just prior to this construction), u.pm == 0 and u.owns == false.
[Note: With a recursive mutex it is possible for both *this and u to own the same mutex before the assignment. In this case, *this will own the mutex after the assignment and u will not. — end note]

Throws: Nothing.

~unique_lock();

Effects: If owns calls pm->unlock().

### § 32.5.4.3.2 Locking

```cpp
void lock();
```

Effects: As if by pm->lock().

Postconditions: owns == true.

Throws: Any exception thrown by pm->lock(). system_error when an exception is required (32.2.2).

Error conditions:

1. operation_not_permitted — if pm is nullptr.
2. resource_deadlock_would_occur — if on entry owns is true.

```cpp
bool try_lock();
```

Preconditions: The supplied Mutex meets the Cpp17Lockable requirements (32.2.5.3).

Effects: As if by pm->try_lock().

Returns: The value returned by the call to try_lock().

Postconditions: owns == res, where res is the value returned by the call to try_lock().

Throws: Any exception thrown by pm->try_lock(). system_error when an exception is required (32.2.2).

Error conditions:

1. operation_not_permitted — if pm is nullptr.
2. resource_deadlock_would_occur — if on entry owns is true.

```cpp
template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (32.2.5.4).

Effects: As if by pm->try_lock_until(abs_time).

Returns: The value returned by the call to try_lock_until(abs_time).

Postconditions: owns == res, where res is the value returned by the call to try_lock_until(abs_time).

Throws: Any exception thrown by pm->try_lock_until(). system_error when an exception is required (32.2.2).

Error conditions:

1. operation_not_permitted — if pm is nullptr.
2. resource_deadlock_would_occur — if on entry owns is true.

```cpp
template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (32.2.5.4).

Effects: As if by pm->try_lock_for(rel_time).

Returns: The value returned by the call to try_lock_for(rel_time).

Postconditions: owns == res, where res is the value returned by the call to try_lock_for(rel_time).

Throws: Any exception thrown by pm->try_lock_for(). system_error when an exception is required (32.2.2).

Error conditions:
void unlock();

Effects: As if by pm->unlock().

Postconditions: owns == false.

Throws: system_error when an exception is required (32.2.2).

Error conditions:

— operation_not_permitted — if on entry owns is false.

32.5.4.3.3 Modifiers

void swap(unique_lock& u) noexcept;

Effects: Swaps the data members of *this and u.

mutex_type* release() noexcept;

Returns: The previous value of pm.

Postconditions: pm == 0 and owns == false.

template<class Mutex>
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

Effects: As if by x.swap(y).

32.5.4.3.4 Observers

bool owns_lock() const noexcept;

Returns: owns.

explicit operator bool() const noexcept;

Returns: owns.

mutex_type *mutex() const noexcept;

Returns: pm.

32.5.4.4 Class template shared_lock

namespace std {
    template<class Mutex>
    class shared_lock {
        public:
            using mutex_type = Mutex;

            // 32.5.4.4.1, construct/copy/destroy
            shared_lock() noexcept;
            explicit shared_lock(mutex_type& m);    // blocking
            shared_lock(mutex_type& m, defer_lock_t) noexcept;
            shared_lock(mutex_type& m, try_to_lock_t);
            shared_lock(mutex_type& m, adopt_lock_t);
            template<class Clock, class Duration>
                shared_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
            template<class Rep, class Period>
                shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
            ~shared_lock();

            shared_lock(const shared_lock&) = delete;
            shared_lock& operator=(const shared_lock&) = delete;

            shared_lock(shared_lock& u) noexcept;
            shared_lock& operator=(shared_lock& u) noexcept;

} // namespace std

§ 32.5.4.4 ©ISO/IEC 2020 – All rights reserved 1578
An object of type `shared_lock` controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `shared_lock` object. Objects of type `shared_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.3) of the `shared_lock` object. The supplied `Mutex` type shall meet the shared mutex requirements (32.5.3.5).

[Note: `shared_lock<Mutex>` meets the `Cpp17TimedLockable` requirements (32.2.5.4). — end note]

### 32.5.4.4.1 Constructors, destructor, and assignment

**shared_lock()** noexcept;

*Postconditions:* `pm` is `nullptr` and `owns` is `false`.

**explicit shared_lock(mutex_type& m);**

2 *Preconditions:* The calling thread does not own the mutex for any ownership mode.

3 *Effects:* Calls `m.lock_shared()`.

4 *Postconditions:* `pm` is `addressof(m)` and `owns` is `true`.

**shared_lock(mutex_type& m, defer_lock_t) noexcept;**

5 *Postconditions:* `pm` is `addressof(m)` and `owns` is `false`.

**shared_lock(mutex_type& m, try_to_lock_t);**

6 *Preconditions:* The calling thread does not own the mutex for any ownership mode.

7 *Effects:* Calls `m.try_lock_shared()`.

8 *Postconditions:* `pm` is `addressof(m)` and `owns` is `res` where `res` is the value returned by the call to `m.try_lock_shared()`.

**shared_lock(mutex_type& m, adopt_lock_t);**

9 *Preconditions:* The calling thread has shared ownership of the mutex.

10 *Postconditions:* `pm` is `addressof(m)` and `owns` is `true`.
template<class Clock, class Duration>
    shared_lock(mutex_type& m,
            const chrono::time_point<Clock, Duration>& abs_time);

11  Preconditions: The calling thread does not own the mutex for any ownership mode.
12  Effects: Calls m.try_lock_shared_until(abs_time).
13  Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to
                m.try_lock_shared_until(abs_time).

template<class Rep, class Period>
    shared_lock(mutex_type& m,
            const chrono::duration<Rep, Period>& rel_time);

14  Preconditions: The calling thread does not own the mutex for any ownership mode.
15  Effects: Calls m.try_lock_shared_for(rel_time).
16  Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to
                m.try_lock_shared_for(rel_time).

~shared_lock();

17  Effects: If owns calls pm->unlock_shared().

shared_lock(shared_lock&& sl) noexcept;

18  Postconditions: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to
                this construction), sl.pm == nullptr and sl.owns == false.

shared_lock& operator=(shared_lock&& sl) noexcept;

19  Postconditions: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to
                this assignment), sl.pm == nullptr and sl.owns == false.

32.5.4.4.2 Locking

void lock();

1  Effects: As if by pm->lock_shared().
2  Postconditions: owns == true.
3  Throws: Any exception thrown by pm->lock_shared(). system_error when an exception is required
        (32.2.2).
4  Error conditions:
6  (4.1) operation_not_permitted — if pm is nullptr.
6  (4.2) resource_deadlock_would_occur — if on entry owns is true.

bool try_lock();

5  Effects: As if by pm->try_lock_shared().
6  Returns: The value returned by the call to pm->try_lock_shared().
7  Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared().
8  Throws: Any exception thrown by pm->try_lock_shared(). system_error when an exception is required
        (32.2.2).
9  Error conditions:
11  (9.1) operation_not_permitted — if pm is nullptr.
11  (9.2) resource_deadlock_would_occur — if on entry owns is true.

template<class Clock, class Duration>
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

10  Effects: As if by pm->try_lock_shared_until(abs_time).
11  Returns: The value returned by the call to pm->try_lock_shared_until(abs_time).
Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared_until(abs_time).

Throws: Any exception thrown by pm->try_lock_shared_until(abs_time). system_error when an exception is required (32.2.2).

Error conditions:

- operation_not_permitted — if pm is nullptr.
- resource_deadlock_would_occur — if on entry owns is true.

template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);

Effects: As if by pm->try_lock_shared_for(rel_time).

Returns: The value returned by the call to pm->try_lock_shared_for(rel_time).

Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared_for(rel_time).

Throws: Any exception thrown by pm->try_lock_shared_for(rel_time). system_error when an exception is required (32.2.2).

Error conditions:

- operation_not_permitted — if pm is nullptr.
- resource_deadlock_would_occur — if on entry owns is true.

void unlock();

Effects: As if by pm->unlock_shared().

Postconditions: owns == false.

Throws: system_error when an exception is required (32.2.2).

Error conditions:

- operation_not_permitted — if on entry owns is false.

32.5.4.4.3 Modifiers

void swap(shared_lock& sl) noexcept;

Effects: Swaps the data members of *this and sl.

mutex_type* release() noexcept;

Returns: The previous value of pm.

Postconditions: pm == nullptr and owns == false.

template<class Mutex>
void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;

Effects: As if by x.swap(y).

32.5.4.4 Observers

bool owns_lock() const noexcept;

Returns: owns.

explicit operator bool() const noexcept;

Returns: owns.

mutex_type* mutex() const noexcept;

Returns: pm.
32.5.5 Generic locking algorithms

```cpp
template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
```

1 **Preconditions:** Each template parameter type meets the Cpp17Lockable requirements. [Note: The unique_lock class template meets these requirements when suitably instantiated. —end note]

2 **Effects:** Calls try_lock() for each argument in order beginning with the first until all arguments have been processed or a call to try_lock() fails, either by returning false or by throwing an exception. If a call to try_lock() fails, unlock() is called for all prior arguments with no further calls to try_lock().

3 **Returns:** -1 if all calls to try_lock() returned true, otherwise a zero-based index value that indicates the argument for which try_lock() returned false.

```cpp
template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);
```

4 **Preconditions:** Each template parameter type meets the Cpp17Lockable requirements. [Note: The unique_lock class template meets these requirements when suitably instantiated. —end note]

5 **Effects:** All arguments are locked via a sequence of calls to lock(), try_lock(), or unlock() on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified. [Note: A deadlock avoidance algorithm such as try-and-back-off must be used, but the specific algorithm is not specified to avoid over-constraining implementations. —end note] If a call to lock() or try_lock() throws an exception, unlock() is called for any argument that had been locked by a call to lock() or try_lock().

32.5.6 Call once

32.5.6.1 Struct once_flag

```cpp
namespace std {
   struct once_flag {
      constexpr once_flag() noexcept;
      once_flag(const once_flag&) = delete;
      once_flag& operator=(const once_flag&) = delete;
   };
}
```

1 The class once_flag is an opaque data structure that call_once uses to initialize data without causing a data race or deadlock.

```cpp
constexpr once_flag() noexcept;
```

2 **Synchronization:** The construction of a once_flag object is not synchronized.

3 **Postconditions:** The object’s internal state is set to indicate to an invocation of call_once with the object as its initial argument that no function has been called.

32.5.6.2 Function call_once

```cpp
template<class Callable, class... Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);
```

1 **Mandates:** is_invocable_v<Callable, Args...> is true.

2 **Effects:** An execution of call_once that does not call its func is a passive execution. An execution of call_once that calls its func is an active execution. An active execution calls INVOKE(std::forward<Callable>(func), std::forward<Args>(args)...). If such a call to func throws an exception the execution is exceptional, otherwise it is returning. An exceptional execution propagates the exception to the caller of call_once. Among all executions of call_once for any given once_flag: at most one is a returning execution; if there is a returning execution, it is the last active execution; and there are passive executions only if there is a returning execution. [Note: Passive executions allow other threads to reliably observe the results produced by the earlier returning execution. —end note] Synchronization: For any given once_flag: all active executions occur in a total order; completion of an active execution synchronizes with (6.9.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

3 **Throws:** system_error when an exception is required (32.2.2), or any exception thrown by func.
5

[Example:
  // global flag, regular function
  void init();
  std::once_flag flag;

  void f() {
    std::call_once(flag, init);
  }

  // function static flag, function object
  struct initializer {
    void operator()();
  };

  void g() {
    static std::once_flag flag2;
    std::call_once(flag2, initializer());
  }

  // object flag, member function
  class information {
    std::once_flag verified;
    void verifier();
  public:
    void verify() { std::call_once(verified, &information::verifier, *this); }
  };
—end example]

32.6 Condition variables

Condition variables provide synchronization primitives used to block a thread until notified by some other
thread that some condition is met or until a system time is reached. Class condition_variable provides a
condition variable that can only wait on an object of type unique_lock<mutex>, allowing the implementation
to be more efficient. Class condition_variable_any provides a general condition variable that can wait on
objects of user-supplied lock types.

Condition variables permit concurrent invocation of the wait, wait_for, wait_until, notify_one and
notify_all member functions.

The executions of notify_one and notify_all are atomic. The executions of wait, wait_for, and wait_until are performed in three atomic parts:
1. the release of the mutex and entry into the waiting state;
2. the unblocking of the wait; and
3. the reacquisition of the lock.

The implementation behaves as if all executions of notify_one, notify_all, and each part of the wait,
wait_for, and wait_until executions are executed in a single unspecified total order consistent with the
'happens before' order.

Condition variable construction and destruction need not be synchronized.

32.6.1 Header <condition_variable> synopsis

namespace std {
  class condition_variable;
  class condition_variable_any;

  void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

  enum class cv_status { no_timeout, timeout };
}
## 32.6.2 Non-member functions

```cpp
void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);
```

### Preconditions:
1. lk is locked by the calling thread and either
   1.1) no other thread is waiting on cond, or
   1.2) lk.mutex() returns the same value for each of the lock arguments supplied by all concurrently waiting (via wait, wait_for, or wait_until) threads.

### Effects:
Transfers ownership of the lock associated with lk into internal storage and schedules cond to be notified when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed. This notification is equivalent to:

```cpp
lk.unlock();
cond.notify_all();
```

### Synchronization:
The implied lk.unlock() call is sequenced after the destruction of all objects with thread storage duration associated with the current thread.

### Notes:
- The supplied lock will be held until the thread exits, and care should be taken to ensure that this does not cause deadlock due to lock ordering issues. After calling notify_all_at_thread_exit it is recommended that the thread should be exited as soon as possible, and that no blocking or time-consuming tasks are run on that thread. — end note
- It is the user’s responsibility to ensure that waiting threads do not erroneously assume that the thread has finished if they experience spurious wakeups. This typically requires that the condition being waited for is satisfied while holding the lock on lk, and that this lock is not released and reacquired prior to calling notify_all_at_thread_exit. — end note

## 32.6.3 Class condition_variable

```cpp
namespace std {
    class condition_variable {
    public:
        condition_variable();
        ~condition_variable();

        condition_variable(const condition_variable&) = delete;
        condition_variable& operator=(const condition_variable&) = delete;

        void notify_one() noexcept;
        void notify_all() noexcept;
        void wait(unique_lock<mutex>& lock);
        template<class Predicate>
            void wait(unique_lock<mutex>& lock, Predicate pred);
        template<class Clock, class Duration>
            cv_status wait_until(unique_lock<mutex>& lock,
                                 const chrono::time_point<Clock, Duration>& abs_time);
        template<class Clock, class Duration, class Predicate>
            bool wait_until(unique_lock<mutex>& lock,
                            const chrono::time_point<Clock, Duration>& abs_time,
                            Predicate pred);
        template<class Rep, class Period>
            cv_status wait_for(unique_lock<mutex>& lock,
                               const chrono::duration<Rep, Period>& rel_time);
        template<class Rep, class Period, class Predicate>
            bool wait_for(unique_lock<mutex>& lock,
                          const chrono::duration<Rep, Period>& rel_time,
                          Predicate pred);

        using native_handle_type = implementation-defined;    // see 32.2.3
        native_handle_type native_handle();                  // see 32.2.3
    }
};
```

1 The class condition_variable is a standard-layout class (11.2).
ISO/IEC JTC1 SC22 WG21 N4860

```c
condition_variable();

2    // Throws: system_error when an exception is required (32.2.2).

3    // Error conditions:

4    // — resource_unavailable_try_again — if some non-memory resource limitation prevents initialization.

5    ~condition_variable();

6    // Preconditions: There is no thread blocked on *this. [Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on *this once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of wait, wait_for, or wait_until that take a predicate. — end note]

7    void notify_one() noexcept;

8    // Effects: If any threads are blocked waiting for *this, unblocks one of those threads.

9    void notify_all() noexcept;

10   // Effects: Unblocks all threads that are blocked waiting for *this.

11   void wait(unique_lock<mutex>& lock);

12   // Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either

13   // — no other thread is waiting on this condition_variable object or

14   // — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently waiting (via wait, wait_for, or wait_until) threads.

15   // Effects:

16   // — Atomically calls lock.unlock() and blocks on *this.

17   // — When unblocked, calls lock.lock() (possibly blocking on the lock), then returns.

18   // — The function will unblock when signaled by a call to notify_one() or a call to notify_all(), or spuriously.

19   // Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

20   // Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

21   // Throws: Nothing.

22   template<class Predicate>

23   void wait(unique_lock<mutex>& lock, Predicate pred);

24   // Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either

25   // — no other thread is waiting on this condition_variable object or

26   // — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently waiting (via wait, wait_for, or wait_until) threads.

27   // Effects: Equivalent to:

28   // while (!pred())

29   //    wait(lock);

30   // Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

31   // Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

32   // Throws: Any exception thrown by pred.

§ 32.6.3 ©ISO/IEC 2020 – All rights reserved 1585
template<class Clock, class Duration>
    cv_status wait_until(unique_lock<mutex>& lock,
                        const chrono::time_point<Clock, Duration>& abs_time);

17  Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(17.1) — no other thread is waiting on this condition_variable object or
(17.2) — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
    waiting (via wait, wait_for, or wait_until) threads.

18  Effects:
(18.1) — Atomically calls lock.unlock() and blocks on *this.
(18.2) — When unblocked, calls lock.lock() (possibly blocking on the lock), then returns.
(18.3) — The function will unblock when signaled by a call to notify_one(), a call to notify_all(),
    expiration of the absolute timeout (32.2.4) specified by abs_time, or spuriously.
(18.4) — If the function exits via an exception, lock.lock() is called prior to exiting the function.

19  Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.1). [Note: This
    can happen if the re-locking of the mutex throws an exception. — end note]

20  Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.
21  Returns: cv_status::timeout if the absolute timeout (32.2.4) specified by abs_time expired, otherwise
    cv_status::no_timeout.

22  Throws: Timeout-related exceptions (32.2.4).

template<class Rep, class Period>
    cv_status wait_for(unique_lock<mutex>& lock,
                        const chrono::duration<Rep, Period>& rel_time);

23  Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(23.1) — no other thread is waiting on this condition_variable object or
(23.2) — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
    waiting (via wait, wait_for, or wait_until) threads.

24  Effects: Equivalent to:
    return wait_until(lock, chrono::steady_clock::now() + rel_time);

25  Returns: cv_status::timeout if the relative timeout (32.2.4) specified by rel_time expired, otherwise
    cv_status::no_timeout.

26  Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.1). [Note: This
    can happen if the re-locking of the mutex throws an exception. — end note]

27  Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.
28  Throws: Timeout-related exceptions (32.2.4).

template<class Clock, class Duration, class Predicate>
    bool wait_until(unique_lock<mutex>& lock,
                    const chrono::time_point<Clock, Duration>& abs_time,
                    Predicate pred);

29  Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(29.1) — no other thread is waiting on this condition_variable object or
(29.2) — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
    waiting (via wait, wait_for, or wait_until) threads.

30  Effects: Equivalent to:
    while (!pred())
        if (wait_until(lock, abs_time) == cv_status::timeout)
            return pred();
template<class Rep, class Period, class Predicate>
bool wait_for(unique_lock<mutex>& lock,
    const chrono::duration<Rep, Period>& rel_time,
    Predicate pred);

Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(35.1) no other thread is waiting on this condition_variable object or
(35.2) lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
waiting (via wait, wait_for, or wait_until) threads.

Effects: Equivalent to:
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));

Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
               Predicate pred);

template<class Lock, class Rep, class Period>
cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);

template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

// 32.6.4.2, interruptible waits
template<class Lock, class Predicate>
bool wait(Lock& lock, stop_token stoken, Predicate pred);

template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, stop_token stoken,
               const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);

template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, stop_token stoken,
              const chrono::duration<Rep, Period>& rel_time, Predicate pred);

};

condition_variable_any();

void notify_one() noexcept;

void notify_all() noexcept;

32.6.4.1 Noninterruptible waits

template<class Lock>
void wait(Lock& lock);

Effects:

(1.1) — Atomically calls lock.unlock() and blocks on *this.

(1.2) — When unblocked, calls lock.lock() (possibly blocking on the lock) and returns.

(1.3) — The function will unblock when signaled by a call to notify_one(), a call to notify_all(), or spuriously.

Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

Postconditions: lock is locked by the calling thread.

Throws: Nothing.
template<class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);

Effects: Equivalent to:
   while (!pred())
       wait(lock);

template<class Lock, class Clock, class Duration>
cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);

Effects:
(6.1) — Atomically calls lock.unlock() and blocks on *this.
(6.2) — When unblocked, calls lock.lock() (possibly blocking on the lock) and returns.
(6.3) — The function will unblock when signaled by a call to notify_one(), a call to notify_all(),
       expiration of the absolute timeout (32.2.4) specified by abs_time, or spuriously.
(6.4) — If the function exits via an exception, lock.lock() is called prior to exiting the function.

Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.1). [Note: This
       can happen if the re-locking of the mutex throws an exception. — end note]

Postconditions: lock is locked by the calling thread.

Returns: cv_status::timeout if the absolute timeout (32.2.4) specified by abs_time expired, otherwise
       cv_status::no_timeout.

Throws: Timeout-related exceptions (32.2.4).

template<class Lock, class Rep, class Period>
cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);

Effects: Equivalent to:
   return wait_until(lock, chrono::steady_clock::now() + rel_time);

Returns: cv_status::timeout if the relative timeout (32.2.4) specified by rel_time expired, otherwise
       cv_status::no_timeout.

Remarks: If the function fails to meet the postcondition, terminate() is called (14.6.1). [Note: This
       can happen if the re-locking of the mutex throws an exception. — end note]

Postconditions: lock is locked by the calling thread.

Throws: Timeout-related exceptions (32.2.4).

template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);

Effects: Equivalent to:
   while (!pred())
       if (wait_until(lock, abs_time) == cv_status::timeout)
           return pred();
   return true;

[Note: There is no blocking if pred() is initially true, or if the timeout has already expired. — end
   note]

[Note: The returned value indicates whether the predicate evaluates to true regardless of whether the
timeout was triggered. — end note]

template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

Effects: Equivalent to:
   return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));

32.6.4.2 Interruptible waits
[thread.condvarany.intwait]
The following wait functions will be notified when there is a stop request on the passed stop_token. In that
case the functions return immediately, returning false if the predicate evaluates to false.
template<class Lock, class Predicate>
bool wait(Lock& lock, stop_token stoken, Predicate pred);

Effects: Registers for the duration of this call *this to get notified on a stop request on stoken during this call and then equivalent to:

while (!stoken.stop_requested()) {
  if (pred())
    return true;
  wait(lock);
}
return pred();

[Note: The returned value indicates whether the predicate evaluated to true regardless of whether there was a stop request. — end note]

Postconditions: lock is locked by the calling thread.

Remarks: If the function fails to meet the postcondition, terminate is called (14.6.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

Throws: Any exception thrown by pred.

template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, stop_token stoken, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);

Effects: Registers for the duration of this call *this to get notified on a stop request on stoken during this call and then equivalent to:

while (!stoken.stop_requested()) {
  if (pred())
    return true;
  if (cv.wait_until(lock, abs_time) == cv_status::timeout)
    return pred();
}
return pred();

[Note: There is no blocking if pred() is initially true, stoken.stop_requested() was already true or the timeout has already expired. — end note]

[Note: The returned value indicates whether the predicate evaluated to true regardless of whether the timeout was triggered or a stop request was made. — end note]

Postconditions: lock is locked by the calling thread.

Remarks: If the function fails to meet the postcondition, terminate is called (14.6.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

Throws: Timeout-related exceptions (32.2.4), or any exception thrown by pred.

template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, stop_token stoken, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

Effects: Equivalent to:

return wait_until(lock, std::move(stoken), chrono::steady_clock::now() + rel_time, std::move(pred));

32.7 Semaphore

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count. A binary semaphore is a semaphore object that has only two states. A binary semaphore should be more efficient than the default implementation of a counting semaphore with a unit resource count.
32.7.1 Header <semaphore> synopsis

```cpp
namespace std {
    template<ptrdiff_t least_max_value = implementation-defined>
    class counting_semaphore;

    using binary_semaphore = counting_semaphore<1>;
}
```

32.7.2 Class template counting_semaphore

```cpp
namespace std {
    template<ptrdiff_t least_max_value = implementation-defined>
    class counting_semaphore {
        public:
            static constexpr ptrdiff_t max() noexcept;
            constexpr explicit counting_semaphore(ptrdiff_t desired);
            ~counting_semaphore();
            counting_semaphore(const counting_semaphore&) = delete;
            counting_semaphore& operator=(const counting_semaphore&) = delete;
            void release(ptrdiff_t update = 1);
            void acquire();
            bool try_acquire() noexcept;
            template<class Rep, class Period>
                bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);
        private:
            ptrdiff_t counter;  // exposition only
    };
}
```

1. Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

2. `least_max_value` shall be non-negative; otherwise the program is ill-formed.

3. Concurrent invocations of the member functions of `counting_semaphore`, other than its destructor, do not introduce data races.

4. `static constexpr ptrdiff_t max() noexcept;`
   - **Returns**: The maximum value of `counter`. This value is greater than or equal to `least_max_value`.

5. `constexpr explicit counting_semaphore(ptrdiff_t desired);`
   - **Preconditions**: `desired >= 0` is true, and `desired <= max()` is true.
   - **Effects**: Initializes `counter` with `desired`.
   - **Throws**: Nothing.

6. `void release(ptrdiff_t update = 1);`
   - **Preconditions**: `update >= 0` is true, and `update <= max() - counter` is true.
   - **Effects**: Atomically execute `counter += update`. Then, unblocks any threads that are waiting for `counter` to be greater than zero.
   - **Synchronization**: Strongly happens before invocations of `try_acquire` that observe the result of the effects.
   - **Throws**: `system_error` when an exception is required (32.2.2).
   - **Error conditions**: Any of the error conditions allowed for mutex types (32.5.3.2).
bool try_acquire() noexcept;

**Effects:** Attempts to atomically decrement `counter` if it is positive, without blocking. If `counter` is not decremented, there is no effect and `try_acquire` immediately returns. An implementation may fail to decrement `counter` even if it is positive. [*Note:* This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (Clause 31). — *end note*] An implementation should ensure that `try_acquire` does not consistently return `false` in the absence of contending semaphore operations.

**Returns:** `true` if `counter` was decremented, otherwise `false`.

void acquire();

**Effects:** Repeatedly performs the following steps, in order:

1. Evaluates `try_acquire`. If the result is `true`, returns.
2. Blocks on `*this` until `counter` is greater than zero.

**Throws:** `system_error` when an exception is required (32.2.2).

**Error conditions:** Any of the error conditions allowed for mutex types (32.5.3.2).

```cpp
template<class Rep, class Period>
bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);

template<class Clock, class Duration>
bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);
```

**Effects:** Repeatedly performs the following steps, in order:

1. Evaluates `try_acquire()`. If the result is `true`, returns `true`.
2. Blocks on `*this` until `counter` is greater than zero or until the timeout expires. If it is unblocked by the timeout expiring, returns `false`.

The timeout expires (32.2.4) when the current time is after `abs_time` (for `try_acquire_until`) or when at least `rel_time` has passed from the start of the function (for `try_acquire_for`).

**Throws:** Timeout-related exceptions (32.2.4), or `system_error` when a non-timeout-related exception is required (32.2.2).

**Error conditions:** Any of the error conditions allowed for mutex types (32.5.3.2).

### 32.8 Coordination types

This subclause describes various concepts related to thread coordination, and defines the coordination types `latch` and `barrier`. These types facilitate concurrent computation performed by a number of threads.

#### 32.8.1 Latches

A latch is a thread coordination mechanism that allows any number of threads to block until an expected number of threads arrive at the latch (via the `count_down` function). The expected count is set when the latch is created. An individual latch is a single-use object; once the expected count has been reached, the latch cannot be reused.

#### 32.8.1.1 Header `<latch>` synopsis

```cpp
namespace std {
    class latch;
}
```

#### 32.8.1.2 Class `latch`

```cpp
namespace std {
    class latch {
        public:
            static constexpr ptrdiff_t max() noexcept;

            constexpr explicit latch(ptrlift_t expected);
            ~latch();

            latch(const latch&) = delete;
            latch& operator=(const latch&) = delete;
}
```
void count_down(ptrdiff_t update = 1);
bool try_wait() const noexcept;
void wait() const;
void arrive_and_wait(ptrdiff_t update = 1);

private:
    pptrdiff_t counter;  // exposition only
};

A latch maintains an internal counter that is initialized when the latch is created. Threads can block on the latch object, waiting for counter to be decremented to zero.

Concurrent invocations of the member functions of latch, other than its destructor, do not introduce data races.

static constexpr pptrdiff_t max() noexcept;

Returns: The maximum value of counter that the implementation supports.

constexpr explicit latch(ptrdiff_t expected);

Preconditions: expected >= 0 is true and expected <= max() is true.
Effects: Initializes counter with expected.
Throws: Nothing.

void count_down(ptrdiff_t update = 1);

Preconditions: update >= 0 is true, and update <= counter is true.
Effects: Atomically decrements counter by update. If counter is equal to zero, unblocks all threads blocked on *this.
Synchronization: Strongly happens before the returns from all calls that are unblocked.
Throws: system_error when an exception is required (32.2.2).
Error conditions: Any of the error conditions allowed for mutex types (32.5.3.2).

bool try_wait() const noexcept;

Returns: With very low probability false. Otherwise counter == 0.

void wait() const;
Effects: If counter equals zero, returns immediately. Otherwise, blocks on *this until a call to count_down that decrements counter to zero.
Throws: system_error when an exception is required (32.2.2).
Error conditions: Any of the error conditions allowed for mutex types (32.5.3.2).

void arrive_and_wait(ptrdiff_t update = 1);
Effects: Equivalent to:
    count_down(update);
    wait();

§ 32.8.2 Barriers

A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier. [Note: A barrier is useful for managing repeated tasks that are handled by multiple threads. — end note]

32.8.2.1 Header <barrier> synopsis

namespace std {
    template<class CompletionFunction = see below>
    class barrier;
}
32.8.2.2 Class template barrier

```cpp
namespace std {
    template<class CompletionFunction = see below>
    class barrier {
    public:
        using arrival_token = see below;
        static constexpr ptrdiff_t max() noexcept;
        constexpr explicit barrier(ptrdiff_t expected,
                                     CompletionFunction f = CompletionFunction());
        ~barrier();
        barrier(const barrier&) = delete;
        barrier& operator=(const barrier&) = delete;
        [[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);
        void wait(arrival_token&& arrival) const;
        void arrive_and_wait();
        void arrive_and_drop();
    private:
        CompletionFunction completion;  // exposition only
    };
}
```

1 Each **barrier phase** consists of the following steps:

  1.1 The expected count is decremented by each call to `arrive` or `arrive_and_drop`.

  1.2 When the expected count reaches zero, the phase completion step is run. For the specialization with the default value of the `CompletionFunction` template parameter, the completion step is run as part of the call to `arrive` or `arrive_and_drop` that caused the expected count to reach zero. For other specializations, the completion step is run on one of the threads that arrived at the barrier during the phase.

  1.3 When the completion step finishes, the expected count is reset to what was specified by the `expected` argument to the constructor, possibly adjusted by calls to `arrive` or `arrive_and_drop` that caused the expected count to reach zero.

2 Each phase defines a **phase synchronization point**. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run.

3 The **phase completion step** that is executed at the end of each phase has the following effects:

  3.1 Invokes the completion function, equivalent to `completion()`.

  3.2 Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object’s member functions other than `wait` are called while the completion step is in progress.

4 Concurrent invocations of the member functions of `barrier`, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.

5 `CompletionFunction` shall meet the `Cpp17MoveConstructible` (Table 28) and `Cpp17Destructible` (Table 32) requirements. `is_nothrow_invocable_v<CompletionFunction&>` shall be `true`.

6 The default value of the `CompletionFunction` template parameter is an unspecified type, such that, in addition to satisfying the requirements of `CompletionFunction`, it meets the `Cpp17DefaultConstructible` requirements (Table 27) and `completion()` has no effects.

7 `barrier::arrival_token` is an unspecified type, such that it meets the `Cpp17MoveConstructible` (Table 28), `Cpp17MoveAssignable` (Table 30), and `Cpp17Destructible` (Table 32) requirements.
static constexpr ptrdiff_t max() noexcept;

Returns: The maximum expected count that the implementation supports.

constexpr explicit barrier(ptrdiff_t expected,
   CompletionFunction f = CompletionFunction());

Preconditions: expected >= 0 is true and expected <= max() is true.

Effects: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to expected. Initializes completion with std::move(f). Starts the first phase. [Note: If expected is 0 this object can only be destroyed. — end note]

Throws: Any exception thrown by CompletionFunction’s move constructor.

[[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);

Preconditions: update > 0 is true, and update is less than or equal to the expected count for the current barrier phase.

Effects: Constructs an object of type arrival_token that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by update.

Synchronization: The call to arrive strongly happens before the start of the phase completion step for the current phase.

Returns: The constructed arrival_token object.

Throws: system_error when an exception is required (32.2.2).

Error conditions: Any of the error conditions allowed for mutex types (32.5.3.2).

void wait(arrival_token&& arrival) const;

Preconditions: arrival is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

Effects: Blocks at the synchronization point associated with std::move(arrival) until the phase completion step of the synchronization point’s phase is run. [Note: If arrival is associated with the synchronization point for a previous phase, the call returns immediately. — end note]

Throws: system_error when an exception is required (32.2.2).

Error conditions: Any of the error conditions allowed for mutex types (32.5.3.2).

void arrive_and_wait();

Effects: Equivalent to: wait(arrive()).

void arrive_and_drop();

Preconditions: The expected count for the current barrier phase is greater than zero.

Effects: Decrement the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

Synchronization: The call to arrive_and_drop strongly happens before the start of the phase completion step for the current phase.

Throws: system_error when an exception is required (32.2.2).

Error conditions: Any of the error conditions allowed for mutex types (32.5.3.2).

[Note: This call can cause the completion step for the current phase to start. — end note]

§ 32.9 Futures

32.9.1 Overview

32.9 describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread. [Note: These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well. — end note]
32.9.2 Header `<future>` synopsis

```cpp
namespace std {
    enum class future_errc {
        broken_promise = implementation-defined,
        future_already_retrieved = implementation-defined,
        promise_already_satisfied = implementation-defined,
        no_state = implementation-defined
    };

    enum class launch : unspecified {
        async = unspecified,
        deferred = unspecified,
        implementation-defined
    };

    enum class future_status {
        ready,
        timeout,
        deferred
    };

    template<> struct is_error_code_enum<future_errc> : public true_type { };
    error_code make_error_code(future_errc e) noexcept;
    error_condition make_error_condition(future_errc e) noexcept;
    const error_category& future_category() noexcept;
    class future_error;

    template<class R> class promise;
    template<class R> class promise<R&>;
    template<> class promise<void>;

    template<class R, class Alloc> struct uses_allocator<promise<R>, Alloc>;
    template<class R> class future;
    template<class R> class future<R&>;
    template<> class future<void>;

    template<class R> class shared_future;
    template<class R> class shared_future<R&>;
    template<> class shared_future<void>;

    template<class> class packaged_task; // not defined
    template<class R, class... ArgTypes> class packaged_task<R(ArgTypes...)>; // not defined
    template<class R, class... ArgTypes> void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;
    template<class F, class... Args>
    [[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
    async(F&& f, Args&&... args);
    template<class F, class... Args>
    [[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
    async(launch policy, F&& f, Args&&... args);
}
```

1 The `enum` type `launch` is a bitmask type (16.4.2.2.4) with elements `launch::async` and `launch::deferred`. [Note: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched]
by `async()` applicable to a corresponding subset of available launch policies. Implementations can extend
the behavior of the first overload of `async()` by adding their extensions to the launch policy under the “as if”
rule. —end note]

The enum values of `future_errc` are distinct and not zero.

### 32.9.3 Error handling

```cpp
const error_category& future_category() noexcept;
```

1. Returns: A reference to an object of a type derived from class `error_category`.
2. The object’s `default_error_condition` and equivalent virtual functions shall behave as specified for the`error_category`. The object’s `name` virtual function returns a pointer to the string "future".

```cpp
error_code make_error_code(future_errc e) noexcept;
```

3. Returns: `error_code(static_cast<int>(e), future_category())`.

```cpp
error_condition make_error_condition(future_errc e) noexcept;
```

4. Returns: `error_condition(static_cast<int>(e), future_category())`.

### 32.9.4 Class `future_error`

```cpp
namespace std {
    class future_error : public logic_error {
        public:
            explicit future_error(future_errc e);

            const error_code& code() const noexcept;
            const char* what() const noexcept;

            private:
                error_code ec_; // exposition only
            }
    }
```

```cpp
explicit future_error(future_errc e);
```

1. Effects: Initializes `ec_` with `make_error_code(e)`.

```cpp
const error_code& code() const noexcept;
```

2. Returns: `ec_`.

```cpp
const char* what() const noexcept;
```

### 32.9.5 Shared state

Many of the classes introduced in subclause 32.9 use some state to communicate results. This `shared state`
consists of some state information and some (possibly not yet evaluated) `result`, which can be a (possibly void)
value or an exception. [Note: Futures, promises, and tasks defined in this clause reference such shared
state. —end note]

[Note: The result can be any kind of object including a function to compute that result, as used by `async`
when policy is `launch::deferred`. —end note]

An `asynchronous return object` is an object that reads results from a shared state. A `waiting function` of an
asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a
waiting function can return before the state is made ready because of a timeout (32.2.5), then it is a `timed
waiting function`, otherwise it is a `non-timed waiting function`.

An `asynchronous provider` is an object that provides a result to a shared state. The result of a shared state
is set by respective functions on the asynchronous provider. [Note: Such as promises or tasks. —end note]
The means of setting the result of a shared state is specified in the description of those classes and functions
that create such a state object.

When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:
— if the return object or provider holds the last reference to its shared state, the shared state is destroyed; and

— the return object or provider gives up its reference to its shared state; and

— these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to std::async, the shared state is not yet ready, and this was the last reference to the shared state.

6 When an asynchronous provider is said to make its shared state ready, it means:

— first, the provider marks its shared state as ready; and

— second, the provider unblocks any execution agents waiting for its shared state to become ready.

7 When an asynchronous provider is said to abandon its shared state, it means:

— first, if that state is not ready, the provider

— stores an exception object of type future_error with an error condition of broken_promise within its shared state; and then

— makes its shared state ready;

— second, the provider releases its shared state.

8 A shared state is ready only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.

9 Calls to functions that successfully set the stored result of a shared state synchronize with (6.9.2) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (6.9.2) the successful return from a call to a waiting function on the shared state.

10 Some functions (e.g., promise::set_value_at_thread_exit) delay making the shared state ready until the calling thread exits. The destruction of each of that thread’s objects with thread storage duration (6.7.5.2) is sequenced before making that shared state ready.

11 Access to the result of the same shared state may conflict (6.9.2). [Note: This explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (16.5.5.10). For example, concurrent accesses through references returned by shared_future::get() (32.9.8) must either use read-only operations or provide additional synchronization. — end note]

32.9.6 Class template promise

namespace std {
    template<class R>
    class promise {
        public:
            promise();
            template<class Allocator>
                promise(allocator_arg_t, const Allocator& a);
            promise(promise&& rhs) noexcept;
            promise(const promise&) = delete;
            ~promise();

            // assignment
            promise& operator=(promise&& rhs) noexcept;
            promise& operator=(const promise&) = delete;
            void swap(promise& other) noexcept;

            // retrieving the result
            future<R> get_future();

            // setting the result
            void set_value(see below);
            void set_exception(exception_ptr p);

        } // promise
    } // namespace std

    template<class R>
    class future {
        public:
            // constructor
            future(future<R>&& other) noexcept;
            future(const future&) = delete;
            ~future();

            // completing the future
            void then(future<R>& r);
            void then(future<R>&& r) noexcept;
            void then(function<void(R)>);
ISO/IEC JTC1 SC22 WG21 N4860

// setting the result with deferred notification
void set_value_at_thread_exit(see below);
void set_exception_at_thread_exit(exception_ptr p);

template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;

template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc>;

1. The implementation provides the template promise and two specializations, promise<R&> and promise<void>. These differ only in the argument type of the member functions set_value and set_value_at_thread_exit, as set out in their descriptions, below.

2. The set_value, set_exception, set_value_at_thread_exit, and set_exception_at_thread_exit member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.

template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc>: true_type { };
void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R&>::set_value(R& r);
void promise<void>::set_value();

16  Effects: Atomically stores the value r in the shared state and makes that state ready (32.9.5).
17  Throws:
(17.1) — future_error if its shared state already has a stored value or exception, or
(17.2) — for the first version, any exception thrown by the constructor selected to copy an object of R, or
(17.3) — for the second version, any exception thrown by the constructor selected to move an object of R.
18  Error conditions:
(18.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(18.2) — no_state if *this has no shared state.

void set_exception(exception_ptr p);

19  Preconditions: p is not null.
20  Effects: Atomically stores the exception pointer p in the shared state and makes that state ready (32.9.5).
21  Throws: future_error if its shared state already has a stored value or exception.
22  Error conditions:
(22.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(22.2) — no_state if *this has no shared state.

void promise::set_value_at_thread_exit(const R& r);
void promise::set_value_at_thread_exit(R&& r);
void promise<R&>::set_value_at_thread_exit(R& r);
void promise<void>::set_value_at_thread_exit();

23  Effects: Stores the value r in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.
24  Throws:
(24.1) — future_error if its shared state already has a stored value or exception, or
(24.2) — for the first version, any exception thrown by the constructor selected to copy an object of R, or
(24.3) — for the second version, any exception thrown by the constructor selected to move an object of R.
25  Error conditions:
(25.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(25.2) — no_state if *this has no shared state.

void set_exception_at_thread_exit(exception_ptr p);

26  Preconditions: p is not null.
27  Effects: Stores the exception pointer p in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.
28  Throws: future_error if an error condition occurs.
29  Error conditions:
(29.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(29.2) — no_state if *this has no shared state.

template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;

30  Effects: As if by x.swap(y).
32.9.7 Class template future

The class template `future` defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed `future` object has no shared state. A `future` object with shared state can be created by functions on asynchronous providers (32.9.5) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a `future` object can be set by calling a respective function on an object that shares the same shared state.

[Note: Member functions of `future` do not synchronize with themselves or with member functions of `shared_future`. — end note]

The effect of calling any member function other than the destructor, the move-assignment operator, `share`, or `valid` on a `future` object for which `valid() == false` is undefined. [Note: It is valid to move from a future object for which `valid() == false`. — end note] [Note: Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`. — end note]

```cpp
namespace std {
  template<class R>
  class future {
    public:
      future() noexcept;
      future(future&&) noexcept;
      future(const future&) = delete;
      ~future();
      future& operator=(const future&) = delete;
      future& operator=(future&&) noexcept;
      shared_future<R> share() noexcept;

      // retrieving the value
      see below get();

      // functions to check state
      bool valid() const noexcept;
      void wait() const;
      template<class Rep, class Period>
        future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
      template<class Clock, class Duration>
        future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
  };
}
```

The implementation provides the template `future` and two specializations, `future<R&>` and `future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

`future() noexcept;`

Effects: The object does not refer to a shared state.

Postconditions: `valid() == false`.

`future(future&& rhs) noexcept;`

Effects: Move constructs a `future` object that refers to the shared state that was originally referred to by `rhs` (if any).

Postconditions:

(8.1) — `valid()` returns the same value as `rhs.valid()` prior to the constructor invocation.

(8.2) — `rhs.valid() == false`.

`~future();`

Effects:

(9.1) — Releases any shared state (32.9.5);
future\& operator=(future\&\& rhs) noexcept;

Effects:
— Releases any shared state (32.9.5).
— move assigns the contents of rhs to *this.

Postconditions:
— valid() returns the same value as rhs.valid() prior to the assignment.
— rhs.valid() == false.

shared_future\<R\> share() noexcept;

Returns: shared_future\<R\>(std::move(*this)).

Postconditions: valid() == false.

R future::get();
R\& future\<R\&>::get();
void future\<void\>::get();

[Note: As described above, the template and its two required specializations differ only in the return type and return value of the member function get. — end note]

Effects:
— waits until the shared state is ready, then retrieves the value stored in the shared state;
— releases any shared state (32.9.5).

Returns:
— future::get() returns the value v stored in the object’s shared state as std::move(v).
— future\<R\&>::get() returns the reference stored as value in the object’s shared state.
— future\<void\>::get() returns nothing.

Throws: The stored exception, if an exception was stored in the shared state.

Postconditions: valid() == false.

bool valid() const noexcept;

Returns: true only if *this refers to a shared state.

void wait() const;

Effects: Blocks until the shared state is ready.

\begin{verbatim}
\template<class Rep, class Period> future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
\end{verbatim}

Effects: None if the shared state contains a deferred function (32.9.9), otherwise blocks until the shared state is ready or until the relative timeout (32.2.4) specified by rel_time has expired.

Returns:
— future_status::deferred if the shared state contains a deferred function.
— future_status::ready if the shared state is ready.
— future_status::timeout if the function is returning because the relative timeout (32.2.4) specified by rel_time has expired.

Throws: timeout-related exceptions (32.2.4).

\begin{verbatim}
\template<class Clock, class Duration> future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
\end{verbatim}

Effects: None if the shared state contains a deferred function (32.9.9), otherwise blocks until the shared state is ready or until the absolute timeout (32.2.4) specified by abs_time has expired.

Returns:
future_status::deferred if the shared state contains a deferred function.

future_status::ready if the shared state is ready.

future_status::timeout if the function is returning because the absolute timeout (32.2.4) specified by abs_time has expired.

Throws: timeout-related exceptions (32.2.4).

32.9.8 Class template shared_future

The class template `shared_future` defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed `shared_future` object has no shared state. A `shared_future` object with shared state can be created by conversion from a `future` object and shares its shared state with the original asynchronous provider (32.9.5) of the shared state. The result (value or exception) of a `shared_future` object can be set by calling a respective function on an object that shares the same shared state.

2 [Note: Member functions of `shared_future` do not synchronize with themselves, but they synchronize with the shared state. — end note]

The effect of calling any member function other than the destructor, the move-assignment operator, the copy-assignment operator, or valid() on a `shared_future` object for which valid() == false is undefined. [Note: It is valid to copy or move from a `shared_future` object for which valid() is false. — end note]

[Note: Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`. — end note]

```cpp
namespace std {
    template<class R>
    class shared_future {
        public:
            shared_future() noexcept;
            shared_future(const shared_future& rhs) noexcept;
            shared_future(future<R>&&) noexcept;
            shared_future(shared_future&& rhs) noexcept;
            ~shared_future();
            shared_future& operator=(const shared_future& rhs) noexcept;
            shared_future& operator=(shared_future&& rhs) noexcept;

            // retrieving the value
            see below get() const;

            // functions to check state
            bool valid() const noexcept;

            void wait() const;
            template<class Rep, class Period>
                future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
            template<class Clock, class Duration>
                future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
        }
    }
```

4 The implementation provides the template `shared_future` and two specializations, `shared_future<R&>` and `shared_future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

```
shared_future() noexcept;
```

Effects: The object does not refer to a shared state.

Postconditions: valid() == false.

```
shared_future(const shared_future& rhs) noexcept;
```

Effects: The object refers to the same shared state as rhs (if any).

Postconditions: valid() returns the same value as rhs.valid().
shared_future(future<R>&& rhs) noexcept;
shared_future(shared_future&& rhs) noexcept;

Effects: Move constructs a shared_future object that refers to the shared state that was originally referred to by rhs (if any).

Postconditions:

(10.1) valid() returns the same value as rhs.valid() returned prior to the constructor invocation.
(10.2) rhs.valid() == false.

~shared_future();

Effects:

(11.1) Releases any shared state (32.9.5);
(11.2) destroys *this.

shared_future& operator=(shared_future&& rhs) noexcept;

Effects:

(12.1) Releases any shared state (32.9.5);
(12.2) move assigns the contents of rhs to *this.

Postconditions:

(13.1) valid() returns the same value as rhs.valid() returned prior to the assignment.
(13.2) rhs.valid() == false.

shared_future& operator=(const shared_future& rhs) noexcept;

Effects:

(14.1) Releases any shared state (32.9.5);
(14.2) assigns the contents of rhs to *this. [Note: As a result, *this refers to the same shared state as rhs (if any). — end note]

Postconditions: valid() == rhs.valid().

const R& shared_future::get() const;
R& shared_future<R&>::get() const;
void shared_future<void>::get() const;

[Note: As described above, the template and its two required specializations differ only in the return type and return value of the member function get. — end note]

[Note: Access to a value object stored in the shared state is unsynchronized, so programmers should apply only those operations on R that do not introduce a data race (6.9.2). — end note]

Effects: wait()s until the shared state is ready, then retrieves the value stored in the shared state.

Returns:

(19.1) shared_future::get() returns a const reference to the value stored in the object’s shared state. [Note: Access through that reference after the shared state has been destroyed produces undefined behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the shared_future object that returned the reference. — end note]
(19.2) shared_future<R&>::get() returns the reference stored as value in the object’s shared state.
(19.3) shared_future<void>::get() returns nothing.

Throws: The stored exception, if an exception was stored in the shared state.

bool valid() const noexcept;

Returns: true only if *this refers to a shared state.

void wait() const;

Effects: Blocks until the shared state is ready.
template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;

Effects: None if the shared state contains a deferred function (32.9.9), otherwise blocks until the shared state is ready or until the relative timeout (32.2.4) specified by rel_time has expired.

Returns:

(24.1) future_status::deferred if the shared state contains a deferred function.
(24.2) future_status::ready if the shared state is ready.
(24.3) future_status::timeout if the function is returning because the relative timeout (32.2.4) specified by rel_time has expired.

Throws: timeout-related exceptions (32.2.4).

template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;

Effects: None if the shared state contains a deferred function (32.9.9), otherwise blocks until the shared state is ready or until the absolute timeout (32.2.4) specified by abs_time has expired.

Returns:

(27.1) future_status::deferred if the shared state contains a deferred function.
(27.2) future_status::ready if the shared state is ready.
(27.3) future_status::timeout if the function is returning because the absolute timeout (32.2.4) specified by abs_time has expired.

Throws: timeout-related exceptions (32.2.4).

32.9.9 Function template async

The function template async provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a future object with which it shares a shared state.

template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>> async(F&& f, Args&&... args);

Mandates: The following are all true:

(2.1) is_constructible_v<decay_t<F>, F>,
(2.2) is_constructible_v<decay_t<Args>, Args> &&...
(2.3) is_move_constructible_v<decay_t<F>>,
(2.4) is_move_constructible_v<decay_t<Args>> &&..., and
(2.5) is_invocable_v<decay_t<F>, decay_t<Args>>...

Preconditions: decay_t<F> and each type in decay_t<Args> meet the Cpp17MoveConstructible requirements.

Effects: The first function behaves the same as a call to the second function with a policy argument of launch::async | launch::deferred and the same arguments for F and Args. The second function creates a shared state that is associated with the returned future object. The further behavior of the second function depends on the policy argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

(4.1) If launch::async is set in policy, calls invoke(decay-copy(std::forward<F>(f)), decay-copy(std::forward<Args>(args)))... (20.14.3, 32.4.2.2) as if in a new thread of execution represented by a thread object with the calls to decay-copy being evaluated in the thread that called async. Any return value is stored as the result in the shared state. Any exception propagated from the execution of invoke(decay-copy(std::forward<F>(f)), decay-copy(std::forward<Args>(args)))... is stored as the exceptional result in the shared state. The thread object

§ 32.9.9 ©ISO/IEC 2020 – All rights reserved 1605
is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.

(4.2) If `launch::deferred` is set in `policy`, stores `decay-copy(std::forward<F>(f))` and `decay-copy(std::forward<Args>(args))`... in the shared state. These copies of `f` and `args` constitute a `deferred function`. Invocation of the deferred function evaluates `invoke(std::move(g), std::move(xyz))` where `g` is the stored value of `decay-copy(std::forward<F>(f))` and `xyz` is the stored copy of `decay-copy(std::forward<Args>(args))`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (32.9.5) on an asynchronous return object referring to this shared state invokes the deferred function in the thread that called the waiting function. Once evaluation of `invoke(std::move(g), std::move(xyz))` begins, the function is no longer considered deferred. [Note: If this policy is specified together with other policies, such as when using a `policy` value of `launch::async | launch::deferred`, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited. — end note]

(4.3) If no value is set in the launch policy, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

5 Returns: An object of type `future<invoke_result_t<decay_t<F>, decay_t<Args>>>` that refers to the shared state created by this call to `async`. [Note: If a future obtained from `async` is moved outside the local scope, other code that uses the future should be aware that the future’s destructor can block for the shared state to become ready. — end note]

6 Synchronization: Regardless of the provided policy argument,

(6.1) the invocation of `async` synchronizes with (6.9.2) the invocation of `f`. [Note: This statement applies even when the corresponding `future` object is moved to another thread. — end note] ; and

(6.2) the completion of the function `f` is sequenced before (6.9.2) the shared state is made ready. [Note: `f` might not be called at all, so its completion might never happen. — end note]

If the implementation chooses the `launch::async` policy,

(6.3) a call to a waiting function on an asynchronous return object that shares the shared state created by this `async` call shall block until the associated thread has completed, as if joined, or else time out (32.4.2.5);

(6.4) the associated thread completion synchronizes with (6.9.2) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

7 Throws: `system_error` if `policy == launch::async` and the implementation is unable to start a new thread, or `std::bad_alloc` if memory for the internal data structures could not be allocated.

8 Error conditions:

(8.1) `resource_unavailable_try_again` — if `policy == launch::async` and the system is unable to start a new thread.

9 [Example:

```cpp
int work1(int value);
int work2(int value);
int work(int value) {
    auto handle = std::async([=]{ return work2(value); });
    int tmp = work1(value);
    return tmp + handle.get(); // #1
}
```

[Note: Line #1 might not result in concurrency because the `async` call uses the default policy, which may use `launch::deferred`, in which case the lambda might not be invoked until the `get()` call; in that case, `work1` and `work2` are called on the same thread and there is no concurrency. — end note] — end example]
32.9.10 Class template packaged_task

The class template packaged_task defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.

When the packaged_task object is invoked, its stored task is invoked and the result (whether normal or exceptional) stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```cpp
namespace std {
    template<class> class packaged_task; // not defined

    template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)> {
        public:
            // construction and destruction
            packaged_task() noexcept;
            template<class F>
            explicit packaged_task(F&& f);
            ~packaged_task();

            // no copy
            packaged_task(const packaged_task&) = delete;
            packaged_task& operator=(const packaged_task&) = delete;

            // move support
            packaged_task(packaged_task&& rhs) noexcept;
            packaged_task& operator=(packaged_task&& rhs) noexcept;

            bool valid() const noexcept;

            // result retrieval
            future<R> get_future();

            // execution
            void operator()(ArgTypes...);
            void make_ready_at_thread_exit(ArgTypes...);
            void reset();
    }

    template<class R, class... ArgTypes>
    void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;
}
```

32.9.10.1 Member functions

### `packaged_task()` noexcept

**Effects:** The object has no shared state and no stored task.

```cpp
template<class F>
    packaged_task(F&& f);
```

**Constraints:** `remove_cvref_t<F>` is not the same type as `packaged_task<R(ArgTypes...)>`.

**Mandates:** `is_invocable_r_v<R, F&, ArgTypes...>` is true.

**Preconditions:** Invoking a copy of `f` behaves the same as invoking `f`.

**Effects:** Constructs a new `packaged_task` object with a shared state and initializes the object’s stored task with `std::forward<F>(f)`.

**Throws:** Any exceptions thrown by the copy or move constructor of `f`, or `bad_alloc` if memory for the internal data structures could not be allocated.
packaged_task(packaged_task&& rhs) noexcept;

Effects: Transfers ownership of rhs’s shared state to *this, leaving rhs with no shared state. Moves the stored task from rhs to *this.

Postconditions: rhs has no shared state.

packaged_task& operator=(packaged_task&& rhs) noexcept;

Effects:

(9.1) Releases any shared state (32.9.5);

(9.2) calls packaged_task(std::move(rhs)).swap(*this).

~packaged_task();

Effects: Abandons any shared state (32.9.5).

void swap(packaged_task& other) noexcept;

Effects: Exchanges the shared states and stored tasks of *this and other.

Postconditions: *this has the same shared state and stored task (if any) as other prior to the call to swap. other has the same shared state and stored task (if any) as *this prior to the call to swap.

bool valid() const noexcept;

Returns: true only if *this has a shared state.

future<R> get_future();

Returns: A future object that shares the same shared state as *this.

Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to operator() or make_ready_at_thread_exit. [Note: Such calls need not synchronize with each other. — end note]

Throws: A future_error object if an error occurs.

Error conditions:

(17.1) future_already_retrieved if get_future has already been called on a packaged_task object with the same shared state as *this.

(17.2) no_state if *this has no shared state.

void operator()(ArgTypes... args);

Effects: As if by INVOKE<R>(f, t1, t2, ..., tN) (20.14.3), where f is the stored task of *this and t1, t2, ..., tN are the values in args... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. The shared state of *this is made ready, and any threads blocked in a function waiting for the shared state of *this to become ready are unblocked.

Throws: A future_error exception object if there is no shared state or the stored task has already been invoked.

Error conditions:

(20.1) promise_already_satisfied if the stored task has already been invoked.

(20.2) no_state if *this has no shared state.

void make_ready_at_thread_exit(ArgTypes... args);

Effects: As if by INVOKE<R>(f, t1, t2, ..., tN) (20.14.3), where f is the stored task and t1, t2, ..., tN are the values in args... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. In either case, this is done without making that state ready (32.9.5) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

Throws: future_error if an error condition occurs.

Error conditions:
— `promise_already_satisfied` if the stored task has already been invoked.
— `no_state` if `*this` has no shared state.

```cpp
void reset();
```

**Effects:** As if `*this = packaged_task(std::move(f))`, where `f` is the task stored in `*this`. [Note: This constructs a new shared state for `*this`. The old state is abandoned (32.9.5). — end note]

**Throws:**
— `bad_alloc` if memory for the new shared state could not be allocated.
— any exception thrown by the move constructor of the task stored in the shared state.
— `future_error` with an error condition of `no_state` if `*this` has no shared state.

### 32.9.10.2 Globals

```cpp
template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;
```

**Effects:** As if by `x.swap(y)`.

Annex A  (informative)
Grammar summary

This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.9, 9.2, 11.8) must be applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules must be used to weed out syntactically valid but meaningless constructs.

A.1 Keywords

New context-dependent keywords are introduced into a program by typedef (9.2.3), namespace (9.8.1), class (Clause 11), enumeration (9.7.1), and template (Clause 13) declarations.

typedef-name:
  identifier
  simple-template-id
namespace-name:
  identifier

  __VA_OPT__ ( pp-tokensopt )
Annex B  (informative)
Implementation quantities  [implimits]

1 Because computers are finite, C++ implementations are inevitably limited in the size of the programs they can successfully process. Every implementation shall document those limitations where known. This documentation may cite fixed limits where they exist, say how to compute variable limits as a function of available resources, or say that fixed limits do not exist or are unknown.

2 The limits may constrain quantities that include those described below or others. The bracketed number following each quantity is recommended as the minimum for that quantity. However, these quantities are only guidelines and do not determine compliance.

(2.1) — Nesting levels of compound statements (8.4), iteration control structures (8.6), and selection control structures (8.5) [256].
(2.2) — Nesting levels of conditional inclusion (15.2) [256].
(2.3) — Pointer (9.3.3.1), array (9.3.3.4), and function (9.3.3.5) declarators (in any combination) modifying a class, arithmetic, or incomplete type in a declaration [256].
(2.4) — Nesting levels of parenthesized expressions (7.5.3) within a full-expression [256].
(2.5) — Number of characters in an internal identifier (5.10) or macro name (15.6) [1024].
(2.6) — Number of characters in an external identifier (5.10, 6.6) [1024].
(2.7) — External identifiers (6.6) in one translation unit [65536].
(2.8) — Identifiers with block scope declared in one block (6.4.3) [1024].
(2.9) — Structured bindings (9.6) introduced in one declaration [256].
(2.10) — Macro identifiers (15.6) simultaneously defined in one translation unit [65536].
(2.11) — Parameters in one function definition (9.5.1) [256].
(2.12) — Arguments in one function call (7.6.1.2) [256].
(2.13) — Parameters in one macro definition (15.6) [256].
(2.14) — Arguments in one macro invocation (15.6) [256].
(2.15) — Characters in one logical source line (5.2) [65536].
(2.16) — Characters in a string-literal (5.13.5) (after concatenation (5.2)) [65536].
(2.17) — Size of an object (6.7.2) [262144].
(2.18) — Nesting levels for #include files (15.3) [256].
(2.19) — Case labels for a switch statement (8.5.2) (excluding those for any nested switch statements) [16384].
(2.20) — Non-static data members (including inherited ones) in a single class (11.4) [16384].
(2.21) — Lambda-captures in one lambda-expression (7.5.5.2) [256].
(2.22) — Enumeration constants in a single enumeration (9.7.1) [4096].
(2.23) — Levels of nested class definitions (11.4.10) in a single member-specification [256].
(2.24) — Functions registered by atexit() (17.5) [32].
(2.25) — Functions registered by at_quick_exit() (17.5) [32].
(2.26) — Direct and indirect base classes (11.7) [16384].
(2.27) — Direct base classes for a single class (11.7) [1024].
(2.28) — Class members declared in a single member-specification (including member functions) (11.4) [4096].
(2.29) — Final overriding virtual functions in a class, accessible or not (11.7.2) [16384].
(2.30) — Direct and indirect virtual bases of a class (11.7.1) [1024].
(2.31) — Static data members of a class (11.4.8.2) [1024].
(2.32) — Friend declarations in a class (11.9.3) [4096].
(2.33) — Access control declarations in a class (11.9.1) [4096].
(2.34) — Member initializers in a constructor definition (11.10.2) [6144].
(2.35) — \textit{initializer-clauses} in one \textit{braced-init-list} (9.4) [16384].
(2.36) — Scope qualifications of one identifier (7.5.4.2) [256].
(2.37) — Nested \textit{linkage-specifications} (9.11) [1024].
(2.38) — Recursive constexpr function invocations (9.2.5) [512].
(2.39) — Full-expressions evaluated within a core constant expression (7.7) [1048576].
(2.40) — Template parameters in a template declaration (13.2) [1024].
(2.41) — Recursively nested template instantiations (13.9.1), including substitution during template argument deduction (13.10.2) [1024].
(2.42) — Handlers per try block (14.4) [256].
(2.43) — Number of placeholders (20.14.14.4) [10].
Annex C (informative)
Compatibility

C.1 C++ and ISO C++ 2017

This subclause lists the differences between C++ and ISO C++ 2017 (ISO/IEC 14882:2017, Programming Languages — C++), by the chapters of this document.

C.1.1 Clause 5: lexical conventions

1 Affected subclauses: 5.4, 10.1, 10.3, 15.1, 15.4, and 15.5

Change: New identifiers with special meaning.
Rationale: Required for new features.
Effect on original feature: Logical lines beginning with module or import may be interpreted differently in this International Standard. [Example:

```cpp
class module {};
module mi; // was variable declaration; now module-declaration
module *m2; // variable declaration

class import {};
import ji; // was variable declaration; now import-declaration
::import j2; // variable declaration
```
—end example]

2 Affected subclause: 5.8

Change: header-name tokens are formed in more contexts.
Rationale: Required for new features.
Effect on original feature: When the identifier import is followed by a < character, a header-name token may be formed. [Example:

```cpp
template<typename> class import {};
import<int> f(); // ill-formed; previously well-formed
::import<int> g(); // OK
```
—end example]

3 Affected subclause: 5.11

Change: New keywords.
Rationale: Required for new features.

(3.1) — The char8_t keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5).
(3.2) — The concept keyword is added to enable the definition of concepts (13.7.8).
(3.3) — The constexpr keyword is added to declare immediate functions (9.2.5).
(3.4) — The constinit keyword is added to prevent unintended dynamic initialization (9.2.6).
(3.5) — The co_await, co_yield, and co_return keywords are added to enable the definition of coroutines (9.5.4).
(3.6) — The requires keyword is added to introduce constraints through a requires-clause (13.1) or a requires-expression (7.5.7).

Effect on original feature: Valid C++ 2017 code using char8_t, concept, constexpr, constinit, co_await, co_yield, co_return, or requires as an identifier is not valid in this International Standard.

4 Affected subclause: 5.12

Change: New operator <=>.
Rationale: Necessary for new functionality.
Effect on original feature: Valid C++ 2017 code that contains a <=> token immediately followed by a > token may be ill-formed or have different semantics in this International Standard:

---
namespace N {
    struct X {}
    bool operator<=(X, X);
    template<bool(X, X)> struct Y {}
    Y<operator<=> y;        // ill-formed; previously well-formed
}

5 Affected subclause: 5.13
Change: Type of UTF-8 string and character literals.
Rationale: Required for new features. The changed types enable function overloading, template specialization, and type deduction to distinguish ordinary and UTF-8 string and character literals.
Effect on original feature: Valid C++ 2017 code that depends on UTF-8 string literals having type “array of const char” and UTF-8 character literals having type “char” is not valid in this International Standard.

const auto *u8s = u8"text";       // u8s previously deduced as const char*; now deduced as const char8_t*
const char *ps = u8s;            // ill-formed; previously well-formed
auto u8c = u8'c';;               // u8c previously deduced as char; now deduced as char8_t
char *pc = &u8c;;                // ill-formed; previously well-formed
std::string s = u8"text";;      // ill-formed; previously well-formed
void f(const char *s);
f(u8"text");                  // ill-formed; previously well-formed

template<typename> struct ct;
template<> struct ct<char> {
    using type = char;
};
ct<decltype(u8'c')>::type x;      // ill-formed; previously well-formed.

C.1.2 Clause 6: basics

1 Affected subclause: 6.7.3
Change: A pseudo-destructor call ends the lifetime of the object to which it is applied.
Rationale: Increase consistency of the language model.
Effect on original feature: Valid ISO C++ 2017 code may be ill-formed or have undefined behavior in this International Standard. [Example:

```cpp
int f() {
    int a = 123;
    using T = int;
    a.~T();
    return a;          // undefined behavior; previously returned 123
}
```
—end example]

2 Affected subclause: 6.9.2.1
Change: Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.
Rationale: Removal of rarely used and confusing feature.
Effect on original feature: If a memory_order_release atomic store is followed by a memory_order_-relaxed store to the same variable by the same thread, then reading the latter value with a memory_order_-acquire load no longer provides any “happens before” guarantees, even in the absence of intervening stores by another thread.

C.1.3 Clause 7: expressions

1 Affected subclause: 7.5.5.2
Change: Implicit lambda capture may capture additional entities.
Rationale: Rule simplification, necessary to resolve interactions with constexpr if.
Effect on original feature: Lambdas with a capture-default may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.
C.1.4 Clause 9: declarations

1 Affected subclause: 9.2.3
Change: Unnamed classes with a typedef name for linkage purposes can contain only C-compatible constructs.
Rationale: Necessary for implementability.
Effect on original feature: Valid C++ 2017 code may be ill-formed in this International Standard.

```cpp
typedef struct {
    void f() {}
} S;
```

2 Affected subclause: 9.3.3.6
Change: A function cannot have different default arguments in different translation units.
Rationale: Required for modules support.
Effect on original feature: Valid C++ 2017 code may be ill-formed in this International Standard, with no diagnostic required.

```cpp
// Translation unit 1
int f(int a = 42);
int g() { return f(); }

// Translation unit 2
int f(int a = 76) { return a; } // ill-formed, no diagnostic required; previously well-formed
int g();
int main() { return g(); } // used to return 42
```

3 Affected subclause: 9.4.1
Change: A class that has user-declared constructors is never an aggregate.
Rationale: Remove potentially error-prone aggregate initialization which may apply notwithstanding the declared constructors of a class.
Effect on original feature: Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this International Standard.

```cpp
struct A { // not an aggregate; previously an aggregate
    A() = delete;
};

struct B { // not an aggregate; previously an aggregate
    B() = default;
    int i = 0;
};

struct C { // not an aggregate; previously an aggregate
    C(C&&) = default;
    int a, b;
};

A a{}; // ill-formed; previously well-formed
B b = {1}; // ill-formed; previously well-formed
auto* c = new C{2, 3}; // ill-formed; previously well-formed

struct Y;

struct X {
    operator Y();
};

struct Y { // not an aggregate; previously an aggregate
    Y(const Y&) = default;
    X x;
};

Y y(x{}); // copy constructor call; previously aggregate-initialization
```

4 Affected subclause: 9.4.4
Change: Boolean conversion from a pointer or pointer-to-member type is now a narrowing conversion.
Rationale: Catches bugs.

Effect on original feature: Valid C++ 2017 code may fail to compile in this International Standard. For example:

```cpp
bool y[] = { "bc" };  // ill-formed; previously well-formed
```

C.1.5 Clause 11: classes

Affected subclauses: 11.4.4 and 11.4.7.2

Change: The class name can no longer be used parenthesized immediately after an `explicit decl-specifier` in a constructor declaration. The `conversion-function-id` can no longer be used parenthesized immediately after an `explicit decl-specifier` in a conversion function declaration.

Rationale: Necessary for new functionality.

Effect on original feature: Valid C++ 2017 code may fail to compile in this International Standard. For example:

```cpp
struct S {
    explicit (S)(const S&);  // ill-formed; previously well-formed
    explicit (operator int)();  // ill-formed; previously well-formed
    explicit (true) (S)(int);  // OK
};
```

Affected subclauses: 11.4.4 and 11.4.6

Change: A `simple-template-id` is no longer valid as the `declarator-id` of a constructor or destructor.

Rationale: Remove potentially error-prone option for redundancy.

Effect on original feature: Valid C++ 2017 code may fail to compile or have different semantics in this International Standard. For example:

```cpp
template<class T>
struct A {
    A<T>();  // error: simple-template-id not allowed for constructor
    A(int);  // OK, injected-class-name used
    ~A<T>();  // error: simple-template-id not allowed for destructor
};
```

Affected subclause: 11.10.5

Change: A function returning an implicitly movable entity may invoke a constructor taking an rvalue reference to a type different from that of the returned expression. Function and catch-clause parameters can be thrown using move constructors.

Rationale: Side effect of making it easier to write more efficient code that takes advantage of moves.

Effect on original feature: Valid C++ 2017 code may fail to compile or have different semantics in this International Standard. For example:

```cpp
struct base {
    base();
    base(base const &);
    private:
    base(base & &);
};

struct derived : base {};

base f(base b) {
    throw b;  // error: base(base & &) is private
    derived d;
    return d;  // error: base(base & &) is private
}

struct S {
    S(const char *s) : m(s) { }
    S(const S & & ) = default;
    S(S & & other) : m(other.m) { other.m = nullptr; }
    const char * m;
};

S consume(S & & s) { return s; }
```
void g() {
    S s("text");
    consume(static_cast<S&&>(s));
    char c = *s.m;        // undefined behavior; previously ok
}

C.1.6 Clause 12: overloading

Affected subclause: 12.4.1.2
Change: Equality and inequality expressions can now find reversed and rewritten candidates.
Rationale: Improve consistency of equality with three-way comparison and make it easier to write the full complement of equality operations.
Effect on original feature: Equality and inequality expressions between two objects of different types, where one is convertible to the other, could invoke a different operator. Equality and inequality expressions between two objects of the same type could become ambiguous.

struct A {
    operator int() const;
};

bool operator==(A, int);       // #1
// #2 is built-in candidate: bool operator==(int, int);
// #3 is built-in candidate: bool operator!=(int, int);

int check(A x, A y) {
    return (x == y) +         // ill-formed; previously well-formed
           (10 == x) +   // calls #1, previously selected #2
           (10 != x);   // calls #1, previously selected #3
}

C.1.7 Clause 13: templates

Affected subclause: 13.3
Change: An unqualified-id that is followed by a < and for which name lookup finds nothing or finds a function will be treated as a template-name in order to potentially cause argument dependent lookup to be performed.
Rationale: It was problematic to call a function template with an explicit template argument list via argument dependent lookup because of the need to have a template with the same name visible via normal lookup.
Effect on original feature: Previously valid code that uses a function name as the left operand of a < operator would become ill-formed.

struct A {};  
bool operator<(void (*fp)(), A);  
void f() {}
int main() {
    A a;
    f < a;       // ill-formed; previously well-formed
    (f) < a;     // still well formed
}

C.1.8 Clause 14: exception handling

Affected subclause: 14.5
Change: Remove throw() exception specification.
Rationale: Removal of obsolete feature that has been replaced by noexcept.
Effect on original feature: A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses throw() for its exception specification will be rejected as ill-formed in this International Standard. It should simply be replaced with noexcept for no change of meaning since C++ 2017. [Note: There is no way to write a function declaration that is non-throwing in this International Standard and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case. — end note]
C.1.9 Clause 16: library introduction

1 Affected subclause: 16.5.1.2
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: <barrier> (32.8.2.1), <bit> (26.5.2), <charconv> (20.19.1), <compare> (17.11.1), <concepts> (18.3), <coroutine> (17.12.1), <format> (20.20.1), <latch> (32.8.1.1), <numbers> (26.9.1), <ranges> (24.2), <semaphore> (32.7.1), <source_location> (17.8.1), <span> (22.7.2), <stop_token> (32.3.2), <syncstream> (29.10.1), and <version> (17.3.1). Valid C++ 2017 code that #includes headers with these names may be invalid in this International Standard.

2 Affected subclause: 16.5.1.2
Change: Remove vacuous C++ header files.
Rationale: The empty headers implied a false requirement to achieve C compatibility with the C++ headers.
Effect on original feature: A valid C++ 2017 program that #includes any of the following headers may fail to compile: <ccomplex>, <ciso646>, <cstdalign>, <cstdbool>, and <ctgmath>. To retain the same behavior:

(2.1) — a #include of <ccomplex> can be replaced by a #include of <complex> (26.4.1),

(2.2) — a #include of <ctgmath> can be replaced by a #include of <cmath> (26.8.1) and a #include of <complex>,

(2.3) — a #include of <ciso646>, <cstdalign>, or <cstdbool> can simply be removed.

C.1.10 Clause 22: containers library

1 Affected subclauses: 22.3.9 and 22.3.10
Change: Return types of remove, remove_if, and unique changed from void to container::size_type.
Rationale: Improve efficiency and convenience of finding number of removed elements.
Effect on original feature: Code that depends on the return types might have different semantics in this International Standard. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.

C.1.11 Clause 23: iterators library

1 Affected subclause: 23.3.2.3
Change: The specialization of iterator_traits for void* and for function pointer types no longer contains any nested typedefs.
Rationale: Corrects an issue misidentifying pointer types that are not incrementable as iterator types.
Effect on original feature: A valid C++ 2017 program that relies on the presence of the typedefs may fail to compile, or have different behavior.

C.1.12 Clause 25: algorithms library

1 Affected subclause: 25.2
Change: The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.
Rationale: Increase implementor freedom and allow some function templates to be implemented as function objects with templated call operators.
Effect on original feature: A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.

C.1.13 Clause 29: input/output library

1 Affected subclause: 29.7.4.2.3
Change: Character array extraction only takes array types.
Rationale: Increase safety via preventing buffer overflow at compile time.
Effect on original feature: Valid C++ 2017 code may fail to compile in this International Standard:

```cpp
auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p;          // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q;          // OK
```

2 Affected subclause: 29.7.5.2.4
Change: Overload resolution for ostream inserters used with UTF-8 literals.
Rationale: Required for new features.

Effect on original feature: Valid C++ 2017 code that passes UTF-8 literals to basic_ostream<char, ...>::operator<< or basic_ostream<wchar_t, ...>::operator<< is now ill-formed.

```cpp
class BasicOstream {
public:
    template <typename charT, bool is_UTF8 = false>
    struct StreamOp {
        template <typename T, typename enable = void>
        friend void operator()(const T& t, basic_ostream<>& os); // valid
    };

    template <typename charT, bool is_UTF8 = false>
    struct StreamOp {  // ill-formed
        template <typename T, typename enable = void>
        friend void operator()(const T& t, basic_ostream<>& os); // ill-formed
    };
}
```

Effect on original feature: Valid C++ 2017 code that passes wchar_t, char16_t, or char32_t characters or strings to basic_ostream<char, ...>::operator<< or that passes char16_t or char32_t characters or strings to basic_ostream<wchar_t, ...>::operator<< is now ill-formed.

```cpp
class BasicOstream {
public:
    template <typename charT, bool is_UTF8 = false>
    struct StreamOp {
        template <typename T, typename enable = void>
        friend void operator()(const T& t, basic_ostream<>& os); // valid
    };

    template <typename charT, bool is_UTF8 = false>
    struct StreamOp {  // ill-formed
        template <typename T, typename enable = void>
        friend void operator()(const T& t, basic_ostream<>& os); // ill-formed
    };
}
```

Affected subclause: 29.7.5.2.4

Change: Overload resolution for ostream inserters used with wchar_t, char16_t, or char32_t types.

Rationale: Removal of surprising behavior.

Effect on original feature: Valid C++ 2017 code that passes wchar_t, char16_t, or char32_t characters or strings to basic_ostream<char, ...>::operator<< or that passes char16_t or char32_t characters or strings to basic_ostream<wchar_t, ...>::operator<< is now ill-formed.

```cpp
class BasicOstream {
public:
    template <typename charT, bool is_UTF8 = false>
    struct StreamOp {
        template <typename T, typename enable = void>
        friend void operator()(const T& t, basic_ostream<>& os); // valid
    };

    template <typename charT, bool is_UTF8 = false>
    struct StreamOp {  // ill-formed
        template <typename T, typename enable = void>
        friend void operator()(const T& t, basic_ostream<>& os); // ill-formed
    };
}
```

Affected subclause: 29.11.7

Change: Return type of filesystem path format observer member functions.

Rationale: Required for new features.

Effect on original feature: Valid C++ 2017 code that depends on the u8string() and generic_u8string() member functions of std::filesystem::path returning std::string is not valid in this International Standard.

```cpp
class Path {
public:
    string u8string() const;  // ill-formed; previously well-formed
    generic_u8string() const;  // ill-formed; previously well-formed
}
```

C.1.14 Annex D: compatibility features

Change: Remove uncaught_exception.

Rationale: The function did not have a clear specification when multiple exceptions were active, and has been superseded by uncaught_exceptions.

Effect on original feature: A valid C++ 2017 program that calls std::uncaught_exception may fail to compile. It might be revised to use std::uncaught_exceptions instead, for clear and portable semantics.

2 Change: Remove support for adaptable function API.

Rationale: The deprecated support relied on a limited convention that could not be extended to support the general case or new language features. It has been superseded by direct language support with decltype, and by the std::bind and std::not_fn function templates.

Effect on original feature: A valid C++ 2017 program that relies on the presence of result_type, argument_type, first_argument_type, or second_argument_type in a standard library class may fail to compile. A valid C++ 2017 program that calls not1 or not2, or uses the class templates unary_negate or binary_negate, may fail to compile.

3 Change: Remove redundant members from std::allocator.

Rationale: std::allocator was overspecified, encouraging direct usage in user containers rather than relying on std::allocator_traits, leading to poor containers.

Effect on original feature: A valid C++ 2017 program that directly makes use of the pointer, const_pointer, reference, const_reference, rebind, address, construct, destroy, or max_size members of std::allocator, or that directly calls allocate with an additional hint argument, may fail to compile.

4 Change: Remove raw_storage_iterator.

Rationale: The iterator encouraged use of algorithms that might throw exceptions, but did not return the number of elements successfully constructed that might need to be destroyed in order to avoid leaks.

Effect on original feature: A valid C++ 2017 program that uses this iterator class may fail to compile.

5 Change: Remove temporary buffers API.

Rationale: The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.
Effect on original feature: A valid C++ 2017 program that calls `get_temporary_buffer` or `return_temporary_buffer` may fail to compile.

Change: Remove `shared_ptr::unique`.
Rationale: The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function `use_count` is similarly unreliable, but has a clearer contract in such cases, and remains available for well defined use in single-threaded cases.

Effect on original feature: A valid C++ 2017 program that calls `unique` on a `shared_ptr` object may fail to compile.

Affected subclause: D.13
Change: Remove deprecated type traits.
Rationale: The traits had unreliable or awkward interfaces. The `is_literal_type` trait provided no way to detect which subset of constructors and member functions of a type were declared `constexpr`. The `result_of` trait had a surprising syntax that could not report the result of a regular function type. It has been superseded by the `invoke_result` trait.

Effect on original feature: A valid C++ 2017 program that relies on the `is_literal_type` or `result_of` type traits, on the `is_literal_type_v` variable template, or on the `result_of_t` alias template may fail to compile.

C.2 C++ and ISO C++ 2014

This subclause lists the differences between C++ and ISO C++ 2014 (ISO/IEC 14882:2014, *Programming Languages — C++*), in addition to those listed above, by the chapters of this document.

C.2.1 Clause 5: lexical conventions

Affected subclause: 5.2
Change: Removal of trigraph support as a required feature.
Rationale: Prevents accidental uses of trigraphs in non-raw string literals and comments.

Effect on original feature: Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this International Standard. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from physical source file characters to the basic source character set.

Affected subclause: 5.9
Change: `pp-number` can contain `p` sign and `P` sign.
Rationale: Necessary to enable `hexadecimal-float-point-literals`.

Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this International Standard. Specifically, character sequences like `0p+0` and `0e1_p+0` are three separate tokens each in C++ 2014, but one single token in this International Standard. For example:

```cpp
#define F(a) b ## a
int b0p = F(0p+0); // ill-formed; equivalent to "int b0p = b0p + 0;" in C++ 2014
```

C.2.2 Clause 7: expressions

Affected subclauses: 7.6.1.5 and 7.6.2.2
Change: Remove increment operator with `bool` operand.
Rationale: Obsolete feature with occasionally surprising semantics.

Effect on original feature: A valid C++ 2014 expression utilizing the increment operator on a `bool` lvalue is ill-formed in this International Standard. Note that this might occur when the lvalue has a type given by a template parameter.

Affected subclauses: 7.6.2.7 and 7.6.2.8
Change: Dynamic allocation mechanism for over-aligned types.
Rationale: Simplify use of over-aligned types.

Effect on original feature: In C++ 2014 code that uses a `new-expression` to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, `::operator new(std::size_t)` is used to allocate the memory. In this International Standard, `::operator new(std::size_t, std::align_val_t)` is used instead.
C.2.3 Clause 9: declarations

1 Affected subclause: 9.2.1

Change: Removal of register storage-class-specifier.

Rationale: Enable repurposing of deprecated keyword in future revisions of this International Standard.

Effect on original feature: A valid C++ 2014 declaration utilizing the register storage-class-specifier is ill-formed in this International Standard. The specifier can simply be removed to retain the original meaning.

2 Affected subclause: 9.2.8.5

Change: auto deduction from braced-init-list.

Rationale: More intuitive deduction behavior.

Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this International Standard. For example:

```cpp
auto x1(1);  // was std::initializer_list<int>, now int
auto x2(1, 2);  // was std::initializer_list<int>, now ill-formed
```

3 Affected subclause: 9.3.3.5

Change: Make exception specifications be part of the type system.

Rationale: Improve type-safety.

Effect on original feature: Valid C++ 2014 code may fail to compile or change meaning in this International Standard. For example:

```cpp
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2);  // ill-formed; previously well-formed
```

4 Affected subclause: 9.4.1

Change: Definition of an aggregate is extended to apply to user-defined types with base classes.

Rationale: To increase convenience of aggregate initialization.

Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this International Standard; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types. For example:

```cpp
struct derived;
struct base {
    friend struct derived;
    private:
        base();
    };
struct derived : base {};

derived d1();  // error; the code was well-formed in C++ 2014
derived d2();  // still OK
```

C.2.4 Clause 11: classes

1 Affected subclause: 11.10.3

Change: Inheriting a constructor no longer injects a constructor into the derived class.

Rationale: Better interaction with other language features.

Effect on original feature: Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A using-declaration that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors.

```cpp
struct A {
    template<typename T> A(T, typename T::type = 0);
    A(int);
};
struct B : A {
    using A::A;
    B(int);
};
B b(42L);  // now calls B<int>, used to call B<long>(long),
// which called A<int> due to substitution failure
// in A<long>(long).
```
C.2.5 Clause 13: templates

Affected subclause: 13.10.2.5
Change: Allowance to deduce from the type of a non-type template argument.
Rationale: In combination with the ability to declare non-type template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the non-type template argument.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this International Standard. For example:

```cpp
template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
void bar(A<0> *p) {
    foo(p); // ill-formed; previously well-formed
}
```

C.2.6 Clause 14: exception handling

Affected subclause: 14.5
Change: Remove dynamic exception specifications.
Rationale: Dynamic exception specifications were a deprecated feature that was complex and brittle in use. They interacted badly with the type system, which became a more significant issue in this International Standard where (non-dynamic) exception specifications are part of the function type.
Effect on original feature: A valid C++ 2014 function declaration, member function declaration, function pointer declaration, or function reference declaration, if it has a potentially throwing dynamic exception specification, will be rejected as ill-formed in this International Standard. Violating a non-throwing dynamic exception specification will call `terminate` rather than `unexpected` and might not perform stack unwinding prior to such a call.

C.2.7 Clause 16: library introduction

Affected subclause: 16.5.1.2
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: `<any>` (20.8.1), `<charconv>` (20.19.1), `<execution>` (20.18.2), `<filesystem>` (29.11.5), `<memory_resource>` (20.12.1), `<optional>` (20.6.2), `<string_view>` (21.4.1), and `<variant>` (20.7.2). Valid C++ 2014 code that #includes headers with these names may be invalid in this International Standard.

Affected subclause: 16.5.4.2.3
Change: New reserved namespaces.
Rationale: Reserve namespaces for future revisions of the standard library that might otherwise be incompatible with existing programs.
Effect on original feature: The global namespaces `std` followed by an arbitrary sequence of digits (5.10) are reserved for future standardization. Valid C++ 2014 code that uses such a top-level namespace, e.g., `std2`, may be invalid in this International Standard.

C.2.8 Clause 20: general utilities library

Affected subclause: 20.14.16
Change: Constructors taking allocators removed.
Rationale: No implementation consensus.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this International Standard. Specifically, constructing a `std::function` with an allocator is ill-formed and uses-allocator construction will not pass an allocator to `std::function` constructors in this International Standard.

Affected subclause: 20.11.3
Change: Different constraint on conversions from `unique_ptr`.
Rationale: Adding array support to `shared_ptr`, via the syntax `shared_ptr<T[]>` and `shared_ptr<T[0]>`.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this International Standard. For example:

```cpp
#include <memory>
std::unique_ptr<int[]> arr(new int[1]);
```
std::shared_ptr<int> ptr(std::move(arr));  // error: int(*)[] is not compatible with int*

C.2.9  Clause 21: strings library  [diff.cpp14.string]

1  Affected subclause: 21.3.2
Change: Non-const .data() member added.
Rationale: The lack of a non-const .data() differed from the similar member of std::vector. This change regularizes behavior for this International Standard.
Effect on original feature: Overloaded functions which have differing code paths for char* and const char* arguments will execute differently when called with a non-const string's .data() member in this International Standard.

```cpp
text int f(char *) = delete;
t int f(const char *);
string s;
t int x = f(s.data());  // ill-formed; previously well-formed
```

C.2.10  Clause 22: containers library  [diff.cpp14.containers]

1  Affected subclause: 22.2.6
Change: Requirements change:
Rationale: Increase portability, clarification of associative container requirements.
Effect on original feature: Valid C++ 2014 code that attempts to use associative containers having a comparison object with non-const function call operator may fail to compile in this International Standard:

```cpp
#include <set>
struct compare
{
 bool operator()(int a, int b)
 {
 return a < b;
 }
};

int main()
{
 const std::set<int, compare> s;
 s.find(0);
}
```

C.2.11  Annex D: compatibility features  [diff.cpp14.depr]

1  Change: The class templates auto_ptr, unary_function, and binary_function, the function templates random_shuffle, and the function templates (and their return types) ptr_fun, mem_fun, mem_fun_ref, 
bind1st, and bind2nd are not defined.
Rationale: Superseded by new features.
Effect on original feature: Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this International Standard.

2  Change: Remove old iostreams members [depr.ios.members].
Rationale: Redundant feature for compatibility with pre-standard code has served its time.
Effect on original feature: A valid C++ 2014 program using these identifiers may be ill-formed in this International Standard.

C.3  C++ and ISO C++ 2011  [diff.cpp11]

1  This subclause lists the differences between C++ and ISO C++ 2011 (ISO/IEC 14882:2011, Programming Languages — C++), in addition to those listed above, by the chapters of this document.

C.3.1  Clause 5: lexical conventions  [diff.cpp11.lex]

1  Affected subclause: 5.9
Change: pp-number can contain one or more single quotes.
Rationale: Necessary to enable single quotes as digit separators.
Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this International Standard. For example, the following code is valid both in C++ 2011 and in this International
Standard, but the macro invocation produces different outcomes because the single quotes delimit a character-
literal in C++ 2011, whereas they are digit separators in this International Standard:

```c
#define M(x, ...) __VA_ARGS__
int x[2] = { M(1'2,3'4, 5 ) };
// int x[2] = { 5 } ; — C++ 2011
// int x[2] = { 3'4, 5 } ; — this International Standard
```

C.3.2 Clause 6: basics

Affected subclause: 6.7.5.4.2

Change: New usual (non-placement) deallocator.

Rationale: Required for sized deallocation.

Effect on original feature: Valid C++ 2011 code could declare a global placement allocation function and
deallocation function as follows:

```c
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```

In this International Standard, however, the declaration of `operator delete` might match a predefined usual
(non-placement) `operator delete` (6.7.5.4). If so, the program is ill-formed, as it was for class member
allocation functions and deallocation functions (7.6.2.7).

C.3.3 Clause 7: expressions

Affected subclause: 7.6.16

Change: A conditional expression with a throw expression as its second or third operand keeps the type
and value category of the other operand.

Rationale: Formerly mandated conversions (lvalue-to-rvalue (7.3.1), array-to-pointer (7.3.2), and function-
to-pointer (7.3.3) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue
conversion, were considered gratuitous and surprising.

Effect on original feature: Valid C++ 2011 code that relies on the conversions may behave differently in
this International Standard:

```c
struct S {
    int x = 1;
    void mf() { x = 2; }
};
int f(bool cond) {
    S s;
    (cond ? s : throw 0).mf();
    return s.x;
}
```

In C++ 2011, `f(true)` returns 1. In this International Standard, it returns 2.

```c
sizeof(true ? "" : throw 0)
```

In C++ 2011, the expression yields `sizeof(const char*)`. In this International Standard, it yields
`sizeof(const char[1])`.

C.3.4 Clause 9: declarations

Affected subclause: 9.2.5

Change: constexpr non-static member functions are not implicitly const member functions.

Rationale: Necessary to allow `constexpr` member functions to mutate the object.

Effect on original feature: Valid C++ 2011 code may fail to compile in this International Standard. For
example, the following code is valid in C++ 2011 but invalid in this International Standard because it declares
the same member function twice with different return types:

```c
struct S {
    constexpr const int &f();
    int &f();
};
```

Affected subclause: 9.4.1

Change: Classes with default member initializers can be aggregates.

Rationale: Necessary to allow default member initializers to be used by aggregate initialization.
Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this International Standard. For example:

```cpp
class S {   // Aggregate in C++ 2014 onwards.
  int m = 1;
};
class X {
  operator int();
  operator S();
};
X a{};
S b(a);   // uses copy constructor in C++ 2011,
// performs aggregate initialization in this International Standard
```

C.3.5 Clause 16: library introduction

1. Affected subclause: 16.5.1.2
   Change: New header.
   Rationale: New functionality.
   Effect on original feature: The C++ header `<shared_mutex>` (32.5.2) is new. Valid C++ 2011 code that includes a header with that name may be invalid in this International Standard.

C.3.6 Clause 29: input/output library

1. Affected subclause: 29.12
   Change: `gets` is not defined.
   Rationale: Use of `gets` is considered dangerous.
   Effect on original feature: Valid C++ 2011 code that uses the `gets` function may fail to compile in this International Standard.

C.4 C++ and ISO C++ 2003

1. This subclause lists the differences between C++ and ISO C++ 2003 (ISO/IEC 14882:2003, Programming Languages — C++), in addition to those listed above, by the chapters of this document.

C.4.1 Clause 5: lexical conventions

1. Affected subclause: 5.4
   Change: New kinds of string-literals.
   Rationale: Required for new features.
   Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this International Standard. Specifically, macros named R, u8, u8R, u, uR, U, UR, or LR will not be expanded when adjacent to a string-literal but will be interpreted as part of the string-literal. For example:

   ```cpp
   #define u8 "abc"
   const char* s = u8"def";   // Previously "abcdef", now "def"
   ```

2. Affected subclause: 5.4
   Change: User-defined literal string support.
   Rationale: Required for new features.
   Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this International Standard. For example:

   ```cpp
   #define _x "there"
   "hello"_x   // #1
   ```
   Previously, #1 would have consisted of two separate preprocessing tokens and the macro _x would have been expanded. In this International Standard, #1 consists of a single preprocessing token, so the macro is not expanded.

3. Affected subclause: 5.11
   Change: New keywords.
   Rationale: Required for new features.
   Effect on original feature: Added to Table 5, the following identifiers are new keywords: alignas, alignof, char16_t, char32_t, constexpr, decldtype, noexcept, nullptr, static_assert, and thread_local. Valid C++ 2003 code using these identifiers is invalid in this International Standard.
C.4.2 Clause 7: expressions

Affected subclause: 5.13.2
Change: Type of integer literals.
Rationale: C99 compatibility.
Effect on original feature: Certain integer literals larger than can be represented by `long` could change from an unsigned integer type to `signed long long`.

C.4.3 Clause 9: declarations

Affected subclause: 9.2
Change: Remove `auto` as a storage class specifier.
Rationale: New feature.
Effect on original feature: Valid C++ 2003 code that uses the keyword `auto` as a storage class specifier may be invalid in this International Standard. In this International Standard, `auto` indicates that the type of a variable is to be deduced from its initializer expression.

C.4.4 Clause 11: classes

Affected subclauses: 11.4.4.1, 11.4.6, 11.4.4.2, and 11.4.5
Change: Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.
Rationale: Improves template argument deduction failure.
Effect on original feature: A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

Affected subclause: 11.4.6
Change: User-declared destructors have an implicit exception specification.
Rationale: Clarification of destructor requirements.
Effect on original feature: Valid C++ 2003 code may execute differently in this International Standard. In particular, destructors that throw exceptions will call `std::terminate` (without calling `std::unexpected`) if their exception specification is non-throwing.

C.4.5 Clause 13: templates

1 Affected subclause: 13.2
Change: Remove `export`.
Rationale: No implementation consensus.
Effect on original feature: A valid C++ 2003 declaration containing `export` is ill-formed in this International Standard.

2 Affected subclause: 13.4
Change: Remove whitespace requirement for nested closing template right angle brackets.
Rationale: Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.
Effect on original feature: Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (">”) followed immediately by another right angle bracket may now be treated as closing two templates. For example, the following code is valid in C++ 2003 because “>>>” is a right-shift operator, but invalid in this International Standard because “>>>” closes two templates.

```cpp
template <class T> struct X { };
template <int N> struct Y { };
X< Y< 1 >> 2 > > x;
```

3 Affected subclause: 13.8.4.2
Change: Allow dependent calls of functions with internal linkage.
Rationale: Overly constrained, simplify overload resolution rules.
Effect on original feature: A valid C++ 2003 program could get a different result than this International Standard.

C.4.6 Clause 16: library introduction

1 Affected: Clause 16 – Clause 32
Change: New reserved identifiers.
Rationale: Required by new features.
Effect on original feature: Valid C++ 2003 code that uses any identifiers added to the C++ standard library by this International Standard may fail to compile or produce different results in this International Standard. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this International Standard.

2 Affected subclause: 16.5.1.2
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: `<array>` (22.3.2), `<atomic>` (31.2), `<chrono>` (27.2), `<codecvt>` (D.20.1), `<condition_variable>` (32.6.1), `<forward_list>` (22.3.4), `<future>` (32.9.2), `<initializer_list>` (17.10.1), `<mutex>` (32.5.1), `<random>` (26.6.1), `<ratio>` (20.16.2), `<regex>` (30.4), `<scoped_allocator>` (20.13.1), `<system_error>` (19.5.1), `<thread>` (32.4.1), `<tuple>` (20.5.2), `<typeindex>` (20.17.1), `<type_traits>` (20.15.2), `<unordered_map>` (22.5.2), and `<unordered_set>` (22.5.3).
In addition the following C compatibility headers are new: `<cfenv>` (26.3.1), `<cinttypes>` (29.12.2), `<cstdint>` (17.4.1), and `<cuchar>` (21.5.5). Valid C++ 2003 code that #includes headers with these names may be invalid in this International Standard.

3 Affected subclause: 16.5.3.2
Effect on original feature: Function `swap` moved to a different header
Rationale: Remove dependency on `<algorithm>` (25.4) for `swap`.
Effect on original feature: Valid C++ 2003 code that has been compiled expecting `swap` to be in `<algorithm>` (25.4) may have to instead include `<utility>` (20.2.1).

4 Affected subclause: 16.5.4.2.2
Change: New reserved namespace.
Rationale: New functionality.
Effect on original feature: The global namespace `posix` is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace `posix` may be invalid in this International Standard.

Affected subclause: 16.5.5.3
Change: Additional restrictions on macro names.
Rationale: Avoid hard to diagnose or non-portable constructs.
Effect on original feature: Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines `override`, `final`, `carries_dependency`, or `noreturn` as macros is invalid in this International Standard.

C.4.7 Clause 17: language support library

Affected subclause: 17.6.2.1
Change: `operator new` may throw exceptions other than `std::bad_alloc`.
Rationale: Consistent application of `noexcept`.
Effect on original feature: Valid C++ 2003 code that assumes that global `operator new` only throws `std::bad_alloc` may execute differently in this International Standard. Valid C++ 2003 code that replaces the global replaceable `operator new` is ill-formed in this International Standard, because the exception specification of `throw(std::bad_alloc)` was removed.

C.4.8 Clause 19: diagnostics library

Affected subclause: 19.4
Change: Thread-local error numbers.
Rationale: Support for new thread facilities.
Effect on original feature: Valid but implementation-specific C++ 2003 code that relies on `errno` being the same across threads may change behavior in this International Standard.

C.4.9 Clause 20: general utilities library

Affected subclause: 20.10.5
Change: Minimal support for garbage-collected regions.
Rationale: Required by new feature.
Effect on original feature: Valid C++ 2003 code, compiled without traceable pointer support, that interacts with newer C++ code using regions declared reachable may have different runtime behavior.

Change: Standard function object types no longer derived from `std::unary_function` or `std::binary_function`.
Rationale: Superseded by new feature; `unary_function` and `binary_function` are no longer defined.
Effect on original feature: Valid C++ 2003 code that depends on function object types being derived from `unary_function` or `binary_function` may fail to compile in this International Standard.

C.4.10 Clause 21: strings library

Affected subclause: 21.3
Change: `basic_string` requirements no longer allow reference-counted strings.
Rationale: Invalidation is subtly different with reference-counted strings. This change regularizes behavior for this International Standard.
Effect on original feature: Valid C++ 2003 code may execute differently in this International Standard.

Affected subclause: 21.3.2.1
Change: Loosen `basic_string` invalidation rules.
Rationale: Allow small-string optimization.
Effect on original feature: Valid C++ 2003 code may execute differently in this International Standard. Some `const` member functions, such as `data` and `c_str`, no longer invalidate iterators.

C.4.11 Clause 22: containers library

Affected subclause: 22.2
Change: Complexity of `size()` member functions now constant.
Rationale: Lack of specification of complexity of `size()` resulted in divergent implementations with inconsistent performance characteristics.
Effect on original feature: Some container implementations that conform to C++ 2003 may not conform
to the specified `size()` requirements in this International Standard. Adjusting containers such as `std::list` to the stricter requirements may require incompatible changes.

2 **Affected subclause:** 22.2  
**Change:** Requirements change: relaxation.  
**Rationale:** Clarification.  
**Effect on original feature:** Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:

2.1 — not all containers provide `size()`; use `empty()` instead of `size() == 0`;  
2.2 — not all containers are empty after construction (`array`);  
2.3 — not all containers have constant complexity for `swap()` (`array`).

3 **Affected subclause:** 22.2  
**Change:** Requirements change: default constructible.  
**Rationale:** Clarification of container requirements.  
**Effect on original feature:** Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.

4 **Affected subclauses:** 22.2.3 and 22.2.6  
**Change:** Signature changes: from `void` return types.  
**Rationale:** Overspecification.  
**Effect on original feature:** The following member functions have changed:

4.1 — erase(iter) for `set`, `multiset`, `map`, `multimap`  
4.2 — erase(begin, end) for `set`, `multiset`, `map`, `multimap`  
4.3 — insert(pos, num, val) for `vector`, `deque`, `list`, `forward_list`  
4.4 — insert(pos, beg, end) for `vector`, `deque`, `list`, `forward_list`  

Valid C++ 2003 code that relies on these functions returning `void` (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this International Standard.

5 **Affected subclauses:** 22.2.3 and 22.2.6  
**Change:** Signature changes: from `iterator` to `const_iterator` parameters.  
**Rationale:** Overspecification.  
**Effect on original feature:** The signatures of the following member functions changed from taking an `iterator` to taking a `const_iterator`:

5.1 — insert(iter, val) for `vector`, `deque`, `list`, `set`, `multiset`, `map`, `multimap`  
5.2 — insert(pos, beg, end) for `vector`, `deque`, `list`, `forward_list`  
5.3 — erase(begin, end) for `set`, `multiset`, `map`, `multimap`  
5.4 — all forms of `list::splice`  
5.5 — all forms of `list::merge`  

Valid C++ 2003 code that uses these functions may fail to compile with this International Standard.

6 **Affected subclauses:** 22.2.3 and 22.2.6  
**Change:** Signature changes: `resize`.  
**Rationale:** Performance, compatibility with move semantics.  
**Effect on original feature:** For `vector`, `deque`, and `list` the fill value passed to `resize` is now passed by reference instead of by value, and an additional overload of `resize` has been added. Valid C++ 2003 code that uses this function may fail to compile with this International Standard.

C.4.12 **Clause 25: algorithms library** [diff.cpp03.algorithms]  

1 **Affected subclause:** 25.1  
**Change:** Result state of inputs after application of some algorithms.  
**Rationale:** Required by new feature.  
**Effect on original feature:** A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this International Standard. For example, `std::remove` and `std::remove_if` may leave the tail of the input sequence with a different set of values than previously.
C.4.13 Clause 26: numerics library  

Affected subclause: 26.4  
Change: Specified representation of complex numbers.  
Rationale: Compatibility with C99.  
Effect on original feature: Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of std::complex may not be compatible with this International Standard.

C.4.14 Clause 29: input/output library  

Affected subclauses: 29.7.4.1.3, 29.7.5.1.3, and 29.5.5.4  
Change: Specify use of explicit in existing boolean conversion functions.  
Rationale: Clarify intentions, avoid workarounds.  
Effect on original feature: Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this International Standard. Such conversions occur in the following conditions:

1. passing a value to a function that takes an argument of type bool;
2. using operator== to compare to false or true;
3. returning a value from a function with a return type of bool;
4. initializing members of type bool via aggregate initialization;
5. initializing a const bool& which would bind to a temporary object.

Affected subclause: 29.5.3.1.1  
Change: Change base class of std::ios_base::failure.  
Rationale: More detailed error messages.  
Effect on original feature: std::ios_base::failure is no longer derived directly from std::exception, but is now derived from std::system_error, which in turn is derived from std::runtime_error. Valid C++ 2003 code that assumes that std::ios_base::failure is derived directly from std::exception may execute differently in this International Standard.

Affected subclause: 29.5.3  
Change: Flag types in std::ios_base are now bitmasks with values defined as constexpr static members.  
Rationale: Required for new features.  
Effect on original feature: Valid C++ 2003 code that relies on std::ios_base flag types being represented as std::bitset or as an integer type may fail to compile with this International Standard. For example:

```cpp
#include <iostream>

int main() {
    int flag = std::ios_base::hex;
    std::cout.setf(flag); // error: setf does not take argument of type int
}
```

C.5 C++ and ISO C  

This subclause lists the differences between C++ and ISO C, in addition to those listed above, by the chapters of this document.

C.5.1 Clause 5: lexical conventions  

Affected subclause: 5.11  
Change: New Keywords  
New keywords are added to C++; see 5.11.  
Rationale: These keywords were added in order to implement the new semantics of C++.  
Effect on original feature: Change to semantics of well-defined feature. Any ISO C programs that used any of these keywords as identifiers are not valid C++ programs.  
Difficulty of converting: Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.  
How widely used: Common.

Affected subclause: 5.13.3  
Change: Type of character-literal is changed from int to char.  
Rationale: This is needed for improved overloaded function argument type matching. For example:
int function( int i );
int function( char c );
function( 'x' );

It is preferable that this call match the second version of function rather than the first.

**Effect on original feature**: Change to semantics of well-defined feature. ISO C programs which depend on
sizeof('x') == sizeof(int)
will not work the same as C++ programs.

**Difficulty of converting**: Simple.

**How widely used**: Programs which depend upon sizeof('x') are probably rare.

**Affected subclause**: 5.13.5

**Change**: String literals made const.
The type of a string-literal is changed from “array of char” to “array of const char”. The type of a UTF-8 string literal is changed from “array of char” to “array of const char8_t”. The type of a UTF-16 string literal is changed from “array of some-integer-type” to “array of const char16_t”. The type of a UTF-32 string literal is changed from “array of some-integer-type” to “array of const char32_t”. The type of a wide string literal is changed from “array of wchar_t” to “array of const wchar_t”.

**Rationale**: This avoids calling an inappropriate overloaded function, which might expect to be able to modify its argument.

**Effect on original feature**: Change to semantics of well-defined feature.

**Difficulty of converting**: Syntactic transformation. The fix is to add a cast:

```c
char* p = "abc";
void f(char*) {
    char* p = (char*)"abc";
    // OK: cast added
    f(p);
    f((char*)"def");
    // OK: cast added
}
```

**How widely used**: Programs that have a legitimate reason to treat string literal objects as potentially modifiable memory are probably rare.

**C.5.2 Clause 6: basics**

**Affected subclause**: 6.2

**Change**: C++ does not have “tentative definitions” as in C.

E.g., at file scope,

```c
int i;
int i;
```
is valid in C, invalid in C++. This makes it impossible to define mutually referential file-local objects with static storage duration, if initializers are restricted to the syntactic forms of C. For example,

```c
struct X { int i; struct X* next; };
static struct X a;
static struct X b = { 0, &a };
static struct X a = { 1, &b };
```

**Rationale**: This avoids having different initialization rules for fundamental types and user-defined types.

**Effect on original feature**: Deletion of semantically well-defined feature.

**Difficulty of converting**: Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local objects with static storage duration must invoke a function call to achieve the initialization.

**How widely used**: Seldom.

**Affected subclause**: 6.4

**Change**: A struct is a scope in C++, not in C.

**Rationale**: Class scope is crucial to C++, and a struct is a class.

**Effect on original feature**: Change to semantics of well-defined feature.

**Difficulty of converting**: Semantic transformation.
How widely used: C programs use `struct` extremely frequently, but the change is only noticeable when `struct`, enumeration, or enumerator names are referred to outside the `struct`. The latter is probably rare.

3 Affected subclause: 6.6 [also 9.2.8]

Change: A name of file scope that is explicitly declared `const`, and not explicitly declared `extern`, has internal linkage, while in C it would have external linkage.

Rationale: Because `const` objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each `const` object. This feature allows the user to put `const` objects in source files that are included in more than one translation unit.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

4 Affected subclause: 6.9.3.1

Change: The `main` function cannot be called recursively and cannot have its address taken.

Rationale: The `main` function may require special actions.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Trivial: create an intermediary function such as `mymain(argc, argv)`.

How widely used: Seldom.

5 Affected subclause: 6.8

Change: C allows “compatible types” in several places, C++ does not.

For example, otherwise-identical `struct` types with different tag names are “compatible” in C but are distinctly different types in C++.

Rationale: Stricter type checking is essential for C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the “layout compatibility rules” of this document.

How widely used: Common.

C.5.3 Clause 7: expressions [diff.expr]

1 Affected subclause: 7.3.11

Change: Converting `void*` to a pointer-to-object type requires casting.

```c
char a[10];
void* b=a;
void foo() {
  char* c=b;
}
```

ISO C will accept this usage of pointer to void being assigned to a pointer to object type. C++ will not.

Rationale: C++ tries harder than C to enforce compile-time type safety.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Could be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast. For example:

```c
char* c = (char*) b;
```

How widely used: This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some ISO C translators will give a warning if the cast is not used.

2 Affected subclause: 7.6.1.2

Change: Implicit declaration of functions is not allowed.

Rationale: The type-safe nature of C++.

Effect on original feature: Deletion of semantically well-defined feature. Note: the original feature was labeled as “obsolescent” in ISO C.

Difficulty of converting: Syntactic transformation. Facilities for producing explicit function declarations are fairly widespread commercially.

How widely used: Common.

3 Affected subclauses: 7.6.1.5 and 7.6.2.2

Change: Decrement operator is not allowed with `bool` operand.
Rationale: Feature with surprising semantics.

Effect on original feature: A valid ISO C expression utilizing the decrement operator on a bool lvalue (for instance, via the C typedef in `<stdbool.h>` (D.9.4)) is ill-formed in this International Standard.

Affected subclauses: 7.6.2.4 and 7.6.3

Change: Types must be defined in declarations, not in expressions.

In C, a sizeof expression or cast expression may define a new type. For example,

\[ p = (\text{void}*) (\text{struct } x \{ \text{int } i; \} *) 0; \]

defines a new type, struct x.

Rationale: This prohibition helps to clarify the location of definitions in the source code.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

Affected subclauses: 7.6.16, 7.6.19, and 7.6.20

Change: The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.

Rationale: C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.

Effect on original feature: Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results. For example,

\[ \text{char } \text{arr}[100]; \]
\[ \text{sizeof(0, arr)} \]

yields 100 in C++ and sizeof(char*) in C.

Difficulty of converting: Programs must add explicit casts to the appropriate rvalue.

How widely used: Rare.

C.5.4 Clause 8: statements

Affected subclauses: 8.5.2 and 8.7.5

Change: It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered).

Rationale: Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of allocation. Furthermore, any use of the uninitialized object could be a disaster. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

Affected subclause: 8.7.3

Change: It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value.

Rationale: The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between void functions and int functions.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. Add an appropriate return value to the source code, such as zero.

How widely used: Seldom. For several years, many existing C implementations have produced warnings in this case.

C.5.5 Clause 9: declarations

Affected subclause: 9.2.1

Change: In C++, the static or extern specifiers can only be applied to names of objects or functions. Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

Example:
static struct S {
    int i;
};

Rationale: Storage class specifiers don’t have any meaning when associated with a type. In C++, class members can be declared with the static storage class specifier. Allowing storage class specifiers on type declarations could render the code confusing for users.

Effect on original feature: Deletion of semantically well-defined feature.

difficulty of converting: Syntactic transformation.

How widely used: Seldom.

2 Affected subclause: 9.2.1

Change: In C++, register is not a storage class specifier.

Rationale: The storage class specifier had no effect in C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Common.

3 Affected subclause: 9.2.3

Change: A C++ typedef name must be different from any class type name declared in the same scope (except if the typedef is a synonym of the class name with the same name). In C, a typedef name and a struct tag name declared in the same scope can have the same name (because they have different name spaces).

Example:
```c
typedef struct name1 { /* ... */ } name1;  // valid C and C++
struct name { /* ... */ };                   // valid C, invalid C++
typedef int name;                           // valid C, invalid C++
```

Rationale: For ease of use, C++ doesn’t require that a type name be prefixed with the keywords class, struct or union when used in object declarations or type casts.

Example:
```c
class name { /* ... */ };                  // i has type class name
name i;                                   // i has type class name
```

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. One of the 2 types has to be renamed.

How widely used: Seldom.

4 Affected subclause: 9.2.8 [see also 6.6]

Change: Const objects must be initialized in C++ but can be left uninitialized in C.

Rationale: A const object cannot be assigned to so it must be initialized to hold a useful value.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

5 Affected subclause: 9.2.8

Change: Banning implicit int.

In C++ a decl-specifier-seq must contain a type-specifier, unless it is followed by a declarator for a constructor, a destructor, or a conversion function. In the following example, the left-hand column presents valid C; the right-hand column presents equivalent C++:
```c
void f(const parm); void f(const int parm);
const n = 3; const int n = 3;
main() int main();
*/ ... */ /* ... */
```

Rationale: In C++, implicit int creates several opportunities for ambiguity between expressions involving function-like casts and declarations. Explicit declaration is increasingly considered to be proper style. Liaison with WG14 (C) indicated support for (at least) deprecating implicit int in the next revision of C.

Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation. Could be automated.
How widely used: Common.

6 Affected subclause: 9.2.8.5
Change: The keyword auto cannot be used as a storage class specifier.

```c
void f() {
    auto int x; // valid C, invalid C++
}
```

Rationale: Allowing the use of auto to deduce the type of a variable from its initializer results in undesired interpretations of auto as a storage class specifier in certain contexts.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Rare.

7 Affected subclause: 9.3.3.5
Change: In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.

Example:

```c
int f(); // means int f(void) in C++
// int f( unknown ) in C
```

Rationale: This is to avoid erroneous function calls (i.e., function calls with the wrong number or type of arguments).
Effect on original feature: Change to semantics of well-defined feature. This feature was marked as “obsolescent” in C.
Difficulty of converting: Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.
How widely used: Common.

8 Affected subclause: 9.3.3.5 [see 7.6.2.4]
Change: In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.

Example:

```c
void f( struct S { int a; } arg ) {} // valid C, invalid C++
enum E { A, B, C } f() {} // valid C, invalid C++
```

Rationale: When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. The type definitions must be moved to file scope, or in header files.
How widely used: Seldom. This style of type definition is seen as poor coding style.

9 Affected subclause: 9.5
Change: In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolescent”.
Rationale: Prototypes are essential to type safety.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Common in old programs, but already known to be obsolescent.

10 Affected subclause: 9.4.1
Change: In C++, designated initialization support is restricted compared to the corresponding functionality in C. In C++, designators for non-static data members must be specified in declaration order, designators
for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

Example:

```c
struct A { int x, y; };
struct B { struct A a; };
struct A a = {.y = 1, .x = 2}; // valid C, invalid C++
struct B b = {.a.x = 0}; // valid C, invalid C++
struct A c = {.x = 1, 2}; // valid C, invalid C++
```

Rationale: In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so field initializers must be specified in order. Array designators conflict with `lambda-expression` syntax. Nested designators are seldom used.

Effect on original feature: Deletion of feature that is incompatible with C++.

Difficulty of converting: Syntactic transformation.

How widely used: Out-of-order initializers are common. The other features are seldom used.

Affected subclause: 9.4.2

Change: In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating `\0`) must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating `\0`.

Example:

```c
char array[4] = "abcd"; // valid C, invalid C++
```

Rationale: When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The arrays must be declared one element bigger to contain the string terminating `\0`.

How widely used: Seldom. This style of array initialization is seen as poor coding style.

Affected subclause: 9.7.1

Change: C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

Example:

```c
enum color { red, blue, green };
enum color c = 1; // valid C, invalid C++
```

Rationale: The type-safe nature of C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)

How widely used: Common.

Affected subclause: 9.7.1

Change: In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is `int`.

Example:

```c
enum e { A };
sizeof(A) == sizeof(int) // in C
sizeof(A) == sizeof(e) // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */
```

Rationale: In C++, an enumeration is a distinct type.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom. The only time this affects existing C code is when the size of an enumerator is taken. Taking the size of an enumerator is not a common C coding practice.
C.5.6 Clause 11: classes

1 Affected subclause: 11.3 [see also 9.2.3]
Change: In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope.

Example:
```c
int x[99];
void f() {
    struct x { int a; };
    sizeof(x); /* size of the array in C */
    /* size of the struct in C++ */
}
```

Rationale: This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords `class`, `struct`, `union` or `enum` be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incompatibility with C described above.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation. If the hidden name that needs to be accessed is at global scope, the :: C++ operator can be used. If the hidden name is at block scope, either the type or the struct tag has to be renamed.

How widely used: Seldom.

2 Affected subclause: 11.4.4.2
Change: Copying volatile objects.

The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue. For example, the following is valid in ISO C:
```c
struct X { int i; };
volatile struct X x1 = {0};
struct X x2 = x1; // invalid C++
struct X x3;
x3 = x1; // also invalid C++
```

Rationale: Several alternatives were debated at length. Changing the parameter to `volatile const X&` would greatly complicate the generation of efficient code for class objects. Discussion of providing two alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases and members.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. If volatile semantics are required for the copy, a user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit `const_cast` can be used.

How widely used: Seldom.

3 Affected subclause: 11.4.9
Change: Bit-fields of type plain `int` are signed.

Rationale: Leaving the choice of signedness to implementations could lead to inconsistent definitions of template specializations. For consistency, the implementation freedom was eliminated for non-dependent types, too.

Effect on original feature: The choice is implementation-defined in C, but not so in C++.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

4 Affected subclause: 11.4.10
Change: In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class belongs to the same scope as the name of the outermost enclosing class.
Example:
```c
struct X {
    struct Y { /* ... */ } y;
};
struct Y yy; // valid C, invalid C++
```

**Rationale:** C++ classes have member functions which require that classes establish scopes. The C rule would leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving nested or local functions.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation. To make the struct type name visible in the scope of the enclosing struct, the struct tag could be declared in the scope of the enclosing struct, before the enclosing struct is defined. Example:
```c
struct Y;
struct X {
    struct Y { /* ... */ } y;
};
```

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of the enclosing struct could be exported to the scope of the enclosing struct. Note: this is a consequence of the difference in scope rules, which is documented in 6.4.

**How widely used:** Seldom.

5 **Affected subclause:** 11.4.11

**Change:** In C++, a typedef name may not be redeclared in a class definition after being used in that definition.

Example:
```c
typedef int I;
struct S {
    I i;
    int I; // valid C, invalid C++
};
```

**Rationale:** When classes become complicated, allowing such a redefinition after the type has been used can create confusion for C++ programmers as to what the meaning of `I` really is.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. Either the type or the struct member has to be renamed.

**How widely used:** Seldom.

C.5.7 Clause 15: preprocessing directives

[diff.cpp]

1 **Affected subclause:** 15.11

**Change:** Whether `__STDC__` is defined and if so, what its value is, are implementation-defined.

**Rationale:** C++ is not identical to ISO C. Mandating that `__STDC__` be defined would require that translators make an incorrect claim. Each implementation must choose the behavior that will be most useful to its marketplace.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Programs and headers that reference `__STDC__` are quite common.

C.6 C standard library

[diff.library]

1 This subclause summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

§ C.6 ©ISO/IEC 2020 – All rights reserved 1658
C.6.1 Modifications to headers

For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in D.9, but their use is deprecated in C++.

There are no C++ headers for the C standard library's headers <stdatomic.h>, <stdnoreturn.h>, and <threads.h>, nor are these headers from the C standard library headers themselves part of C++.

The C headers <complex.h> and <tgmath.h> do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

C.6.2 Modifications to definitions

C.6.2.1 Types char16_t and char32_t

The types char16_t and char32_t are distinct types rather than typedefs to existing integral types. The tokens char16_t and char32_t are keywords in this International Standard (5.11). They do not appear as macro or type names defined in <cuchar> (21.5.5).

C.6.2.2 Type wchar_t

The type wchar_t is a distinct type rather than a typedef to an existing integral type. The token wchar_t is a keyword in this International Standard (5.11). It does not appear as a macro or type name defined in any of <cstddef> (17.2.1), <cstdlib> (17.2.2), or <cwchar> (21.5.4).

C.6.2.3 Header <assert.h>

The token static_assert is a keyword in this International Standard (5.11). It does not appear as a macro name defined in <cassert> (19.3.1).

C.6.2.4 Header <iso646.h>

The tokens and, and_eq, bitand, bitor, compl, not, not_eq, or, or_eq, xor, and xor_eq are keywords in this International Standard (5.11), and are not introduced as macros by <iso646.h> (D.9.2).

C.6.2.5 Header <stdalign.h>

The token alignas is a keyword in this International Standard (5.11), and is not introduced as a macro by <stdalign.h> (D.9.3).

C.6.2.6 Header <stdbool.h>

The tokens bool, true, and false are keywords in this International Standard (5.11), and are not introduced as macros by <stdbool.h> (D.9.4).

C.6.2.7 Macro NULL

The macro NULL, defined in any of <locale> (28.5.1), <cstddef> (17.2.1), <cstdio> (29.12.1), <cstdlib> (17.2.2), <cstring> (21.5.3), <ctime> (27.14), or <cwchar> (21.5.4), is an implementation-defined C++ null pointer constant in this International Standard (17.2).

C.6.3 Modifications to declarations

Header <cstring> (21.5.3): The following functions have different declarations:

- strchr
- strpbrk
- strrrchr
- strstr
- memchr

Subclause 21.5.3 describes the changes.

Header <cwchar> (21.5.4): The following functions have different declarations:

- wcschr
- wcpbrk
- wcsrchr
- wcsstr
Header `<cstdlib>` (17.2.2): The following functions have different behavior:

- `atexit`
- `exit`
- `abort`

Subclause 17.5 describes the changes.

Header `<csetjmp>` (17.13.2): The following functions have different behavior:

- `longjmp`

Subclause 17.13.2 describes the changes.

C.6.4.1 Macro `offsetof(type, member-designator)`

The macro `offsetof`, defined in `<cstddef>` (17.2.1), accepts a restricted set of `type` arguments in this International Standard. Subclause 17.2.4 describes the change.

C.6.4.2 Memory allocation functions

The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in this International Standard. Subclause 20.10.12 describes the changes.
Annex D  (normative)
Compatibility features  [depr]

1 This Clause describes features of the C++ Standard that are specified for compatibility with existing implementations.
2 These are deprecated features, where deprecated is defined as: Normative for the current edition of this International Standard, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the deprecated attribute (9.12.4).

D.1 Arithmetic conversion on enumerations  [depr.arith.conv.enum]
1 The ability to apply the usual arithmetic conversions (7.4) on operands where one is of enumeration type and the other is of a different enumeration type or a floating-point type is deprecated. [Note: Three-way comparisons (7.6.8) between such operands are ill-formed. — end note] [Example:

```cpp
def enum E1 { e; 
    enum E2 { f }; 
    bool b = e <= 3.7;                   // deprecated
    int k = f - e;                       // deprecated
    auto cmp = e <=> f;                 // error
```

—end example]

D.2 Implicit capture of *this by reference  [depr.capture.this]
1 For compatibility with prior C++ International Standards, a lambda-expression with capture-default = (7.5.5.2) may implicitly capture *this by reference. [Example:

```cpp
def struct X {
    int x;
    void foo(int n) {
        auto f = [=]() { x = n; };          // deprecated: x means this->x, not a copy thereof
        auto g = [=, this]() { x = n; };    // recommended replacement
    }
};
```

—end example]

D.3 Comma operator in subscript expressions  [depr.comma.subscript]
1 A comma expression (7.6.20) appearing as the expr-or-braced-init-list of a subscripting expression (7.6.1.1) is deprecated. [Note: A parenthesized comma expression is not deprecated. — end note] [Example:

```cpp
def void f(int *a, int b, int c) {
    a[b,c];                                      // deprecated
    a[(b,c)];                                    // OK
}
```

—end example]

D.4 Array comparisons  [depr.array.comp]
1 Equality and relational comparisons (7.6.10, 7.6.9) between two operands of array type are deprecated. [Note: Three-way comparisons (7.6.8) between such operands are ill-formed. — end note] [Example:

```cpp
def int arr1[5];
    int arr2[5];
    bool same = arr1 == arr2;                  // deprecated, same as &arr1[0] == &arr2[0],
    auto cmp = arr1 <=> arr2;                 // does not compare array contents
```

—end example]
D.5 Deprecated volatile types

1 Postfix ++ and -- expressions (7.6.1.5) and prefix ++ and -- expressions (7.6.2.2) of volatile-qualified arithmetic and pointer types are deprecated.

[Example:
  volatile int velociraptor;
  ++velociraptor;  // deprecated
  --velociraptor;  // deprecated
  —end example]

2 Certain assignments where the left operand is a volatile-qualified non-class type are deprecated; see 7.6.19.

[Example:
  int neck, tail;
  volatile int brachiosaur;
  brachiosaur = neck;  // OK
  tail = brachiosaur;  // OK
  tail = brachiosaur = neck;  // deprecated
  brachiosaur += neck;  // deprecated
  brachiosaur = brachiosaur + neck;  // OK
  —end example]

3 A function type (9.3.3.5) with a parameter with volatile-qualified type or with a volatile-qualified return type is deprecated.

[Example:
  volatile struct amber jurassic();  // deprecated
  void trex(volatile short left_arm, volatile short right_arm);  // deprecated
  void fly(volatile struct pterosaur* pteranodon);  // OK
  —end example]

4 A structured binding (9.6) of a volatile-qualified type is deprecated.

[Example:
  struct linhenykus { short forelimb; 
  void park(linhenykus alvarezsauroid) {
    volatile auto [what_is_this] = alvarezsauroid;  // deprecated
    // ...
  }
  —end example]

D.6 Redeclaration of static constexpr data members

1 For compatibility with prior C++ International Standards, a constexpr static data member may be redundantly redeclared outside the class with no initializer. This usage is deprecated. [Example:
  struct A {
    static constexpr int n = 5;  // definition (declaration in C++ 2014)
  };

  constexpr int A::n;  // redundant declaration (definition in C++ 2014)
  —end example]

D.7 Non-local use of TU-local entities

1 A declaration of a non-TU-local entity that is an exposure (6.6) is deprecated. [Note: Such a declaration in an importable module unit is ill-formed. —end note] [Example:
  namespace {
    struct A {
      void f() {}
    }
  }
  A h();  // deprecated: not internal linkage
  inline void g() {A().f();}  // deprecated: inline and not internal linkage
  —end example]
D.8 Implicit declaration of copy functions

The implicit definition of a copy constructor (11.4.4.2) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (11.4.6). The implicit definition of a copy assignment operator (11.4.5) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor. In a future revision of this International Standard, these implicit definitions could become deleted (9.5.3).

D.9 C headers

For compatibility with the C standard library, the C++ standard library provides the C headers shown in Table 147.

Table 147: C headers

<table>
<thead>
<tr>
<th>assert.h</th>
<th>inttypes.h</th>
<th>signal.h</th>
<th>stdio.h</th>
<th>wchar.h</th>
</tr>
</thead>
<tbody>
<tr>
<td>complex.h</td>
<td>iso646.h</td>
<td>stdalign.h</td>
<td>stdlib.h</td>
<td>wctype.h</td>
</tr>
<tr>
<td>type.h</td>
<td>limits.h</td>
<td>stdarg.h</td>
<td>string.h</td>
<td></td>
</tr>
<tr>
<td>errno.h</td>
<td>locale.h</td>
<td>stdbool.h</td>
<td>time.h</td>
<td></td>
</tr>
<tr>
<td>env.h</td>
<td>math.h</td>
<td>stddef.h</td>
<td></td>
<td></td>
</tr>
<tr>
<td>float.h</td>
<td>setjmp.h</td>
<td>stdint.h</td>
<td>uchar.h</td>
<td></td>
</tr>
</tbody>
</table>

D.9.1 Header <complex.h> synopsis

The header <complex.h> behaves as if it simply includes the header <complex> (26.4.1).

[Note: Names introduced by <complex> in namespace std are not placed into the global namespace scope by <complex.h>. —end note]

D.9.2 Header <iso646.h> synopsis

The C++ header <iso646.h> is empty. [Note: and, and_eq, bitand, bitor, compl, not_eq, not, or, or_eq, xor, and xor_eq are keywords in this International Standard (5.11). —end note]

D.9.3 Header <stdalign.h> synopsis

The contents of the C++ header <stdalign.h> are the same as the C standard library header <stdalign.h>, with the following changes: The header <stdalign.h> does not define a macro named alignas.

See also: ISO C 7.15

D.9.4 Header <stdbool.h> synopsis

The contents of the C++ header <stdbool.h> are the same as the C standard library header <stdbool.h>, with the following changes: The header <stdbool.h> does not define macros named bool, true, or false.

See also: ISO C 7.18

D.9.5 Header <tgmath.h> synopsis

The header <tgmath.h> behaves as if it simply includes the headers <cmath> (26.8.1) and <complex> (26.4.1).

[Note: The overloads provided in C by type-generic macros are already provided in <complex> and <cmath> by “sufficient” additional overloads. —end note]

[Note: Names introduced by <cmath> or <complex> in namespace std are not placed into the global namespace scope by <tgmath.h>. —end note]
D.9.6 Other C headers

Every C header other than `<complex.h>` (D.9.1), `<iso646.h>` (D.9.2), `<stdalign.h>` (D.9.3), `<stdbool.h>` (D.9.4), and `<tgmath.h>` (D.9.5), each of which has a name of the form `<name>.h>`, behaves as if each name placed in the standard library namespace by the corresponding `<c name> header is placed within the global namespace scope, except for the functions described in 26.8.6, the declaration of `std::byte` (17.2.1), and the functions and function templates described in 17.2.5. It is unspecified whether these names are first declared or defined within namespace scope (6.4.6) of the namespace std and are then injected into the global namespace scope by explicit using-declarations (9.9).

[Example: The header `<cstdlib>` assuredly provides its declarations and definitions within the namespace std. It may also provide these names within the global namespace. The header `<stdlib.h>` assuredly provides the same declarations and definitions within the global namespace, much as in the C Standard. It may also provide these names within the namespace std. — end example]

D.10 Requires paragraph

In addition to the elements specified in 16.4.1.4, descriptions of function semantics may also contain a Requires: element to denote the preconditions for calling a function.

Violation of any preconditions specified in a function’s Requires: element results in undefined behavior unless the function’s Throws: element specifies throwing an exception when the precondition is violated.

D.11 Relational operators

The header `<utility>` (20.2.1) has the following additions:

```cpp
namespace std::rel_ops {
  template<class T> bool operator!=(const T&, const T&);
  template<class T> bool operator> (const T&, const T&);
  template<class T> bool operator<=(const T&, const T&);
  template<class T> bool operator>=(const T&, const T&);
}
```

To avoid redundant definitions of `operator!=` out of `operator==` and operators `>`, `< =`, and `>=` out of `operator<`, the library provides the following:

```cpp
template<class T> bool operator!=(const T& x, const T& y);
  Requires: Type T is Cpp17EqualityComparable (Table 25).
  Returns: !(x == y).

template<class T> bool operator>(const T& x, const T& y);
  Requires: Type T is Cpp17LessThanComparable (Table 26).
  Returns: y < x.

template<class T> bool operator<=(const T& x, const T& y);
  Requires: Type T is Cpp17LessThanComparable (Table 26).
  Returns: !(y < x).

template<class T> bool operator>=(const T& x, const T& y);
  Requires: Type T is Cpp17LessThanComparable (Table 26).
  Returns: !(x < y).
```

D.12 char* streams

D.12.1 Header `<strstream>` synopsis

The header `<strstream>` defines types that associate stream buffers with character array objects and assist reading and writing such objects.

```cpp
namespace std {
  class strstreambuf;
  class istrstream;
  class ostrstream;
}
```
class strstream;

D.12.2 Class strstreambuf

namespace std {
    class strstreambuf : public basic_streambuf<char> {
public:
        strstreambuf() : strstreambuf(0) {}
        explicit strstreambuf(streamsize alsize_arg);
        strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));
        strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);
        strstreambuf(const char* gnext_arg, streamsize n);
        strstreambuf(signed char* gnext_arg, streamsize n,
                     signed char* pbeg_arg = nullptr);
        strstreambuf(const signed char* gnext_arg, streamsize n);
        strstreambuf(const unsigned char* gnext_arg, streamsize n);
        strstreambuf(const unsigned char* gnext_arg, streamsize n);
        virtual ~strstreambuf();
        void freeze(bool freezefl = true);
        char* str();
        int pcount();

protected:
        int_type overflow (int_type c = EOF) override;
        int_type pbackfail(int_type c = EOF) override;
        int_type underflow() override;
        pos_type seekoff(off_type off, ios_base::seekdir way,
                         ios_base::openmode which = ios_base::in | ios_base::out) override;
        pos_type seekpos(pos_type sp,
                         ios_base::openmode which = ios_base::in | ios_base::out) override;
        streambuf* setbuf(char* s, streamsize n) override;

private:
        using strstate = T1; // exposition only
        static const strstate allocated; // exposition only
        static const strstate constant; // exposition only
        static const strstate dynamic; // exposition only
        static const strstate frozen; // exposition only
        strstate strmode; // exposition only
        streamsize alsize; // exposition only
        void* (*palloc)(size_t); // exposition only
        void (*pfree)(void*); // exposition only
    }
};

1 The class strstreambuf associates the input sequence, and possibly the output sequence, with an object of some character array type, whose elements store arbitrary values. The array object has several attributes.

2 [Note: For the sake of exposition, these are represented as elements of a bitmask type (indicated here as T1) called strstate. The elements are:

(2.1) — allocated, set when a dynamic array object has been allocated, and hence should be freed by the destructor for the strstreambuf object;

(2.2) — constant, set when the array object has const elements, so the output sequence cannot be written;

(2.3) — dynamic, set when the array object is allocated (or reallocated) as necessary to hold a character sequence that can change in length;

(2.4) — frozen, set when the program has requested that the array object not be altered, reallocated, or freed.

— end note]
[Note: For the sake of exposition, the maintained data is presented here as:

(3.1) — strstate strmode, the attributes of the array object associated with the `strstreambuf` object;
(3.2) — int alsizet, the suggested minimum size for a dynamic array object;
(3.3) — void* (*palloc)(size_t), points to the function to call to allocate a dynamic array object;
(3.4) — void (*pfree)(void*), points to the function to call to free a dynamic array object.

— end note]

Each object of class `strstreambuf` has a *seekable area*, delimited by the pointers `seeklow` and `seekhigh`. If `gnext` is a null pointer, the seekable area is undefined. Otherwise, `seeklow` equals `gbeg` and `seekhigh` is either `pend`, if `pend` is not a null pointer, or `gend`.

### D.12.2.1 `strstreambuf` constructors

#### `explicit strstreambuf(streamsize alsizet_arg);`

Effects: Initializes the base class with `streambuf()`. The postconditions of this function are indicated in Table 148.

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>dynamic</td>
</tr>
<tr>
<td>alsizet</td>
<td>alsizet_arg</td>
</tr>
<tr>
<td>palloc</td>
<td>a null pointer</td>
</tr>
<tr>
<td>pfree</td>
<td>a null pointer</td>
</tr>
</tbody>
</table>

#### `strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));`

Effects: Initializes the base class with `streambuf()`. The postconditions of this function are indicated in Table 149.

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>dynamic</td>
</tr>
<tr>
<td>alsizet</td>
<td>an unspecified value</td>
</tr>
<tr>
<td>palloc</td>
<td>palloc_arg</td>
</tr>
<tr>
<td>pfree</td>
<td>pfree_arg</td>
</tr>
</tbody>
</table>

#### `strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);`

Effects: Initializes the base class with `streambuf()`. The postconditions of this function are indicated in Table 150.

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>0</td>
</tr>
<tr>
<td>alsizet</td>
<td>an unspecified value</td>
</tr>
<tr>
<td>palloc</td>
<td>a null pointer</td>
</tr>
<tr>
<td>pfree</td>
<td>a null pointer</td>
</tr>
</tbody>
</table>
gnext_arg shall point to the first element of an array object whose number of elements \( N \) is determined as follows:

- If \( n > 0 \), \( N \) is \( n \).
- If \( n == 0 \), \( N \) is `std::strlen(gnext_arg)`.
- If \( n < 0 \), \( N \) is `INT_MAX`.327

If pbeg_arg is a null pointer, the function executes:

```
setg(gnext_arg, gnext_arg, gnext_arg + N);
```

Otherwise, the function executes:

```
setg(gnext_arg, gnext_arg, pbeg_arg);
setp(pbeg_arg, pbeg_arg + N);
```

`strstreambuf(const char* gnext_arg, streamsize n);`

`strstreambuf(const signed char* gnext_arg, streamsize n);`

`strstreambuf(const unsigned char* gnext_arg, streamsize n);`

Effects: Behaves the same as `strstreambuf((char*)gnext_arg,n)`, except that the constructor also sets constant in strmode.

`virtual ~strstreambuf();`

Effects: Destroys an object of class `strstreambuf`. The function frees the dynamically allocated array object only if `(strmode & allocated) != 0` and `(strmode & frozen) == 0`. (D.12.2.3 describes how a dynamically allocated array object is freed.)

D.12.2.2 Member functions [depr.strstreambuf.members]

```cpp
void freeze(bool freezefl = true);
```

Effects: If `strmode & dynamic` is nonzero, alters the freeze status of the dynamic array object as follows:

- If `freezefl` is `true`, the function sets `frozen` in `strmode`.
- Otherwise, it clears `frozen` in `strmode`.

```cpp
char* str();
```

Effects: Calls `freeze()`, then returns the beginning pointer for the input sequence, `gbeg`.

Remarks: The return value can be a null pointer.

```cpp
int pcount() const;
```

Effects: If the next pointer for the output sequence, `pnext`, is a null pointer, returns zero. Otherwise, returns the current effective length of the array object as the next pointer minus the beginning pointer for the output sequence, `pnext - pbeg`.

D.12.2.3 strstreambuf overridden virtual functions [depr.strstreambuf.virtuals]

```cpp
int_type overflow(int_type c = EOF) override;
```

Effects: Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

- If `c != EOF` and if either the output sequence has a write position available or the function makes a write position available (as described below), assigns `c` to `*pnext++`.
  Returns `(unsigned char)c`.
- If `c == EOF`, there is no character to append.
  Returns a value other than `EOF`.

Remarks: The function can alter the number of write positions available as a result of any call.

---

327 The function signature `strlen(const char*)` is declared in `<cstring>` (21.5.3). The macro `INT_MAX` is defined in `<climits>` (17.3.6).
To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements \( n \) to hold the current array object (if any), plus at least one additional write position. How many additional write positions are made available is otherwise unspecified.\(^{328} \)

If \( \text{palloc} \) is not a null pointer, the function calls \((\ast \text{palloc})(n)\) to allocate the new dynamic array object. Otherwise, it evaluates the expression \texttt{new charT}[n]\. In either case, if the allocation fails, the function returns \texttt{EOF}. Otherwise, it sets \texttt{allocated} in \texttt{strmode}.

To free a previously existing dynamic array object whose first element address is \( p \): If \( \text{pfree} \) is not a null pointer, the function calls \((\ast \text{pfree})(p)\). Otherwise, it evaluates the expression \texttt{delete \[p\]}.

If \((\text{strmode} \& \text{dynamic}) = 0\), or if \((\text{strmode} \& \text{frozen}) \neq 0\), the function cannot extend the array (reallocate it with greater length) to make a write position available.

\[
\text{int_type pbackfail(int_type c = EOF) override;}
\]

Puts back the character designated by \( c \) to the input sequence, if possible, in one of three ways:

1. If \( c \neq \text{EOF} \), if the input sequence has a putback position available, and if \((\text{char})c == \text{gnext}[-1]\), assigns \( \text{gnext} - 1 \) to \( \text{gnext} \).
   
   Returns \( c \).

2. If \( c \neq \text{EOF} \), if the input sequence has a putback position available, and if \( \text{strmode} \& \text{constant} \) is zero, assigns \( c \) to \(*--\text{gnext} \).

   Returns \( c \).

3. If \( c == \text{EOF} \) and if the input sequence has a putback position available, assigns \( \text{gnext} - 1 \) to \( \text{gnext} \).

   Returns a value other than \texttt{EOF}.

Returns \texttt{EOF} to indicate failure.

Remarks: If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

\[
\text{int_type underflow() override;}
\]

Effects: Reads a character from the input sequence, if possible, without moving the stream position past it, as follows:

1. If the input sequence has a read position available, the function signals success by returning \((\text{unsigned char})\ast \text{gnext} \).

Returns \((\text{unsigned char})\ast \text{gnext} \).

2. Otherwise, if the current write next pointer \( \text{pnext} \) is not a null pointer and is greater than the current read end pointer \( \text{gend} \), makes a read position available by assigning to \( \text{gend} \) a value greater than \( \text{gnext} \) and no greater than \( \text{pnext} \).

Returns \((\text{unsigned char})\ast \text{gnext} \).

Returns \texttt{EOF} to indicate failure.

Remarks: The function can alter the number of read positions available as a result of any call.

\[
\text{pos_type seekoff(off_type off, seekdir way, openmode which = in | out) override;}
\]

Effects: Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 151.

For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines \texttt{newoff} as indicated in Table 152.

If \((\text{newoff} + \text{off}) < (\text{seeklow} - \text{xbeg})\) or \((\text{seekhigh} - \text{xbeg}) < (\text{newoff} + \text{off})\), the positioning operation fails. Otherwise, the function assigns \( \text{xbeg} + \text{newoff} + \text{off} \) to the next pointer \( \text{xnext} \).

Returns: \texttt{pos_type(newoff)}, constructed from the resultant offset \texttt{newoff} (of type \texttt{off_type}), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is \texttt{pos_type(\text{off_type}(-1))}.

\(^{328}\) An implementation should consider \texttt{alsize} in making this decision.
Table 151: seekoff positioning

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>(which &amp; ios::in) != 0</td>
<td>positions the input sequence</td>
</tr>
<tr>
<td>(which &amp; ios::out) != 0</td>
<td>positions the output sequence</td>
</tr>
<tr>
<td>(which &amp; (ios::in</td>
<td>ios::out)) == (ios::in</td>
</tr>
<tr>
<td>Otherwise</td>
<td>the positioning operation fails.</td>
</tr>
</tbody>
</table>

Table 152: newoff values

<table>
<thead>
<tr>
<th>Condition</th>
<th>newoff Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>way == ios::beg</td>
<td>0</td>
</tr>
<tr>
<td>way == ios::cur</td>
<td>the next pointer minus the beginning pointer (xnext - xbeg).</td>
</tr>
<tr>
<td>way == ios::end</td>
<td>seekhigh minus the beginning pointer (seekhigh - xbeg).</td>
</tr>
</tbody>
</table>

```cpp
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

**Effects:** Alters the stream position within one of the controlled sequences, if possible, to correspond to the stream position stored in `sp` (as described below).

- **(17.1)** If `(which & ios::in) != 0`, positions the input sequence.
- **(17.2)** If `(which & ios::out) != 0`, positions the output sequence.
- **(17.3)** If the function positions neither sequence, the positioning operation fails.

For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines `newoff` from `sp.offset()`:

- **(18.1)** If `newoff` is an invalid stream position, has a negative value, or has a value greater than `(seekhigh - seeklow)`, the positioning operation fails.
- **(18.2)** Otherwise, the function adds `newoff` to the beginning pointer `xbeg` and stores the result in the next pointer `xnext`.

**Returns:** `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

```cpp
streambuf<char>* setbuf(char* s, streamsize n) override;
```

**Effects:** Behavior is implementation-defined, except that `setbuf(0, 0)` has no effect.

### D.12.3 Class istrstream

```cpp
namespace std {
    class istrstream : public basic_istream<char> {
        public:
            explicit istrstream(const char* s);
            explicit istrstream(char* s);
            istrstream(const char* s, streamsize n);
            istrstream(char* s, streamsize n);
            virtual ~istrstream();

            strstreambuf* rdbuf() const;
            char* str();
        private:
            strstreambuf sb; // exposition only
    }
}
```

§ D.12.3 ©ISO/IEC 2020 – All rights reserved
The class `istringstream` supports the reading of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `strstreambuf` object.

### D.12.3.1 `istringstream` constructors

**explicit `istringstream(const char* s)`;**

**explicit `istringstream(char* s)`;**

1. **Effects:** Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, 0)`. `s` shall designate the first element of an NTBS.

2. **Effects:** Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, n)`. `s` shall designate the first element of an array whose length is `n` elements, and `n` shall be greater than zero.

### D.12.3.2 Member functions

**`strstreambuf* rdbuf() const;`**

1. **Returns:** `const_cast<strstreambuf*>(&sb)`.

**`char* str();`**

2. **Returns:** `rdbuf()->str()`.

### D.12.4 Class `ostrstream`

**namespace std {**

```cpp
class ostrstream : public basic_ostream<char> {
public:
    ostrstream();
    ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
    virtual ~ostrstream();

    strstreambuf* rdbuf() const;
    void freeze(bool freezefl = true);
    char* str();
    int pcount() const;
private:
    strstreambuf sb; // exposition only
};
```

The class `ostrstream` supports the writing of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `strstreambuf` object.

### D.12.4.1 `ostrstream` constructors

**ostrstream();**

1. **Effects:** Initializes the base class with `ostream(&sb)` and `sb` with `strstreambuf()`.

2. **Effects:** Initializes the base class with `ostream(&sb)`, and `sb` with one of two constructors:

   (2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements.
   The constructor is `strstreambuf(s, n, s)`.

   (2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an NTBS whose first element is designated by `s`. The constructor is `strstreambuf(s, n, s + std::strlen(s))`.\(^{329}\)

329) The function signature `strlen(const char*)` is declared in `<cstring>` (21.5.3).

§ D.12.4.1 © ISO/IEC 2020 – All rights reserved
D.12.4.2 Member functions

strstreambuf* rdbuf() const;

Returns: \((\text{strstreambuf*})\&sb\).

void freeze(bool freeze1 = true);

Effects: Calls rdbuf()\(\rightarrow\)freeze(freeze1).

char* str();

Returns: rdbuf()\(\rightarrow\)str().

int pcount() const;

Returns: rdbuf()\(\rightarrow\)pcount().

D.12.5 Class strstream

namespace std {

class strstream : public basic_iostream<char> {

public:

using char_type = char;
using int_type = char_traits<char>::int_type;
using pos_type = char_traits<char>::pos_type;
using off_type = char_traits<char>::off_type;

// constructors/destructor
strstream();
strstream(char* s, int n,
    ios_base::openmode mode = ios_base::in|ios_base::out);
virtual ~strstream();

// members
strstreambuf* rdbuf() const;
void freeze(bool freeze1 = true);
int pcount() const;
char* str();

private:
    strstreambuf sb; // exposition only
};

} // namespace std

1 The class strstream supports reading and writing from objects of class strstreambuf. It supplies a strstreambuf object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

\[ (1.1) \quad \text{sb, the strstreambuf object.} \]

D.12.5.1 strstream constructors

strstream();

Effects: Initializes the base class with iostream(&sb).

strstream(char* s, int n,
    ios_base::openmode mode = ios_base::in|ios_base::out);

Effects: Initializes the base class with iostream(&sb), and sb with one of the two constructors:

\[ (2.1) \quad \text{If (mode & app) == 0, then s shall designate the first element of an array of n elements. The constructor is strstreambuf(s,n,s).} \]

\[ (2.2) \quad \text{If (mode & app) != 0, then s shall designate the first element of an array of n elements that contains an NTBS whose first element is designated by s. The constructor is strstreambuf(s,n,s + std::strlen(s)).} \]
D.12.5.2  **strstream destructor**  

```
virtual ~strstream();
```

**Effects:** Destroys an object of class `strstream`.

D.12.5.3  **strstream operations**

```
strstreambuf* rdbuf() const;
```

**Returns:** `const_cast<strstreambuf*>(&sb)`.

```
void freeze(bool freezefl = true);
```

**Effects:** Calls `rdbuf()->freeze(freezefl)`.

```
char* str();
```

**Returns:** `rdbuf()->str()`.

```
int pcount() const;
```

**Returns:** `rdbuf()->pcount()`.

D.13  **Deprecated type traits**

The header `<type_traits>` (20.15.2) has the following addition:

```
namespace std {
    template<class T> struct is_pod;
    template<class T> inline constexpr bool is_pod_v = is_pod<T>::value;
}
```

The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.

```
template<class T> struct is_pod;
```

**Requires:** `remove_all_extents_t<T>` shall be a complete type or `cv void`.

```
is_pod<T> is a Cpp17UnaryTypeTrait (20.15.1) with a base characteristic of `true_type` if `T` is a POD type, and `false_type` otherwise. A POD class is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A POD type is a scalar type, a POD class, an array of such a type, or a cv-qualified version of one of these types.
```

[Note: It is unspecified whether a closure type (7.5.5.1) is a POD type. —end note]

D.14  **Tuple**

The header `<tuple>` (20.5.2) has the following additions:

```
namespace std {
    template<class T> class tuple_size<volatile T>;
    template<class T> class tuple_size<const volatile T>;

    template<
        size_t I, class T>
    class tuple_element<I, volatile T>;
    template<
        size_t I, class T>
    class tuple_element<I, const volatile T>;
}
```

```
template<class T> class tuple_size<volatile T>;
template<class T> class tuple_size<const volatile T>;
```

Let `TS` denote `tuple_size<T>` of the cv-unqualified type `T`. If the expression `TS::value` is well-formed when treated as an unevaluated operand, then specializations of each of the two templates meet the `Cpp17TransformationTrait` requirements with a base characteristic of `integral_constant<

```
size_t, TS::value`
```

Otherwise, they have no member `value`.

Access checking is performed as if in a context unrelated to `TS` and `T`. Only the validity of the immediate context of the expression is considered.

In addition to being available via inclusion of the `<tuple>` (20.5.2) header, the two templates are available when any of the headers `<array>` (22.3.2), `<ranges>` (24.2), or `<utility>` (20.2.1) are included.
template<size_t I, class T> class tuple_element<I, volatile T>;
template<size_t I, class T> class tuple_element<I, const volatile T>;

Let TE denote tuple_element_t<I, T> of the cv-unqualified type T. Then specializations of each of the two templates meet the Cpp17TransformationTrait requirements with a member typedef type that names the following type:

- for the first specialization, add_volatile_t<TE>, and
- for the second specialization, add_cv_t<TE>.

In addition to being available via inclusion of the <tuple> (20.5.2) header, the two templates are available when any of the headers <array> (22.3.2), <ranges> (24.2), or <utility> (20.2.1) are included.

D.15 Variant

The header <variant> (20.7.2) has the following additions:

namespace std {
    template<class T> struct variant_size<volatile T>;
    template<class T> struct variant_size<const volatile T>;
    template<size_t I, class T> struct variant_alternative<I, volatile T>;
    template<size_t I, class T> struct variant_alternative<I, const volatile T>;
}

template<class T> class variant_size<volatile T>;
template<class T> class variant_size<const volatile T>;

Let VS denote variant_size<T> of the cv-unqualified type T. Then specializations of each of the two templates meet the Cpp17UnaryTypeTrait requirements with a base characteristic of integral_constant<size_t, VS::value>.

template<size_t I, class T> class variant_alternative<I, volatile T>;
template<size_t I, class T> class variant_alternative<I, const volatile T>;

Let VA denote variant_alternative<I, T> of the cv-unqualified type T. Then specializations of each of the two templates meet the Cpp17TransformationTrait requirements with a member typedef type that names the following type:

- for the first specialization, add_volatile_t<VA::type>, and
- for the second specialization, add_cv_t<VA::type>.

D.16 Deprecated iterator primitives

D.16.1 Basic iterator

The header <iterator> (23.2) has the following addition:

namespace std {
    template<class Category, class T, class Distance = ptrdiff_t,
             class Pointer = T*, class Reference = T&>
    struct iterator {
        using iterator_category = Category;
        using value_type = T;
        using difference_type = Distance;
        using pointer = Pointer;
        using reference = Reference;
    };
}

The iterator template may be used as a base class to ease the definition of required types for new iterators.

[Note: If the new iterator type is a class template, then these aliases will not be visible from within the iterator class's template definition, but only to callers of that class. — end note]

[Example: If a C++ program wants to define a bidirectional iterator for some data structure containing double and such that it works on a large memory model of the implementation, it can do so with:
class MyIterator : 
public iterator<bidirectional_iterator_tag, double, long, T*, T&> {
    // code implementing ++, etc.
};
—end example]

D.17 Deprecated move_iterator access
[depr.move.iter.elem]
1 The following member is declared in addition to those members specified in 23.5.3.5:

    namespace std {
        template<class Iterator>
        class move_iterator {
            public:
                constexpr pointer operator->() const;
            }
    }

customexpr pointer operator->() const;

2 Returns: current.

D.18 Deprecated shared_ptr atomic access
[depr.util.smartptr.shared.atomic]
1 The header <memory> (20.10.2) has the following additions:

    namespace std {
        template<class T>
        bool atomic_is_lock_free(const shared_ptr<T>* p);

        template<class T>
        shared_ptr<T> atomic_load(const shared_ptr<T>* p);
        template<class T>
        shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

        template<class T>
        void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);
        template<class T>
        void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

        template<class T>
        shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);
        template<class T>
        shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

        template<class T>
        bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
        template<class T>
        bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
        template<class T>
        bool atomic_compare_exchange_weak_explicit( 
            shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w, 
            memory_order success, memory_order failure);
        template<class T>
        bool atomic_compare_exchange_strong_explicit( 
            shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w, 
            memory_order success, memory_order failure);
    }

2 Concurrent access to a shared_ptr object from multiple threads does not introduce a data race if the access is done exclusively via the functions in this subclause and the instance is passed as their first argument.

3 The meaning of the arguments of type memory_order is explained in 31.4.

    template<class T> bool atomic_is_lock_free(const shared_ptr<T>* p);
4 Requires: p shall not be null.

    Returns: true if atomic access to *p is lock-free, false otherwise.
template<class T> shared_ptr<T> atomic_load(const shared_ptr<T>* p);

Requires: p shall not be null.
Returns: atomic_load_explicit(p, memory_order::seq_cst).

Throws: Nothing.

template<class T> shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

Requires: p shall not be null.
Requires: mo shall not be memory_order::release or memory_order::acq_rel.
Returns: *p.

Throws: Nothing.

template<class T> void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);

Requires: p shall not be null.
Effects: As if by atomic_store_explicit(p, r, memory_order::seq_cst).
Throws: Nothing.

template<class T> void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

Requires: p shall not be null.
Requires: mo shall not be memory_order::acquire or memory_order::acq_rel.
Effects: As if by p->swap(r).
Throws: Nothing.

template<class T> shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);

Requires: p shall not be null.
Returns: atomic_exchange_explicit(p, r, memory_order::seq_cst).
Throws: Nothing.

template<class T>
shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

Requires: p shall not be null.
Effects: As if by p->swap(r).
Returns: The previous value of *p.
Throws: Nothing.

template<class T>
bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

Requires: p shall not be null and v shall not be null.
Returns: atomic_compare_exchange_weak_explicit(p, v, w, memory_order::seq_cst, memory_order::seq_cst)

Throws: Nothing.

template<class T>
bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

Returns: atomic_compare_exchange_strong_explicit(p, v, w, memory_order::seq_cst,

memory_order::seq_cst)

template<class T>
bool atomic_compare_exchange_weak_explicit(
shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
memory_order success, memory_order failure);
template<class T>
bool atomic_compare_exchange_strong_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);

Requires: p shall not be null and v shall not be null. The failure argument shall not be memory_order::release nor memory_order::acq_rel.

Effects: If *p is equivalent to *v, assigns w to *p and has synchronization semantics corresponding to the value of success, otherwise assigns *p to *v and has synchronization semantics corresponding to the value of failure.

Returns: true if *p was equivalent to *v, false otherwise.

Throws: Nothing.

Remarks: Two shared_ptr objects are equivalent if they store the same pointer value and share ownership. The weak form may fail spuriously. See 31.8.1.

D.19 Deprecated basic_string capacity

The following member is declared in addition to those members specified in 21.3.2.4:

namespace std {
    template<class charT, class traits = char_traits<charT>,
        class Allocator = allocator<charT>>
    class basic_string {
    public:
        void reserve();
    };
}

void reserve();

Effects: After this call, capacity() has an unspecified value greater than or equal to size(). [Note: This is a non-binding shrink to fit request. — end note]

D.20 Deprecated standard code conversion facets

The header <codecvt> provides code conversion facets for various character encodings.

D.20.1 Header <codecvt> synopsis

namespace std {
    enum codecvt_mode {
        consume_header = 4,
        generate_header = 2,
        little_endian = 1
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf8 : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf8(size_t refs = 0);
        -codecvt_utf8();
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf16 : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf16(size_t refs = 0);
        -codecvt_utf16();
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf8_utf16 : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf8_utf16(size_t refs = 0);
        -codecvt_utf8_utf16();
    }
}
D.20.2 Requirements

1 For each of the three code conversion facets `codecvt_utf8`, `codecvt_utf16`, and `codecvt_utf8_utf16`:

1.1 `Elem` is the wide-character type, such as `wchar_t`, `char16_t`, or `char32_t`.

1.2 `Maxcode` is the largest wide-character code that the facet will read or write without reporting a conversion error.

1.3 If `(Mode & consume_header)`, the facet shall consume an initial header sequence, if present, when reading a multibyte sequence to determine the endianness of the subsequent multibyte sequence to be read.

1.4 If `(Mode & generate_header)`, the facet shall generate an initial header sequence when writing a multibyte sequence to advertise the endianness of the subsequent multibyte sequence to be written.

1.5 If `(Mode & little_endian)`, the facet shall generate a multibyte sequence in little-endian order, as opposed to the default big-endian order.

2 For the facet `codecvt_utf8`:

2.1 The facet shall convert between UTF-8 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`) within the program.

2.2 Endianness shall not affect how multibyte sequences are read or written.

2.3 The multibyte sequences may be written as either a text or a binary file.

3 For the facet `codecvt_utf16`:

3.1 The facet shall convert between UTF-16 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`) within the program.

3.2 Multibyte sequences shall be read or written according to the `Mode` flag, as set out above.

3.3 The multibyte sequences may be written only as a binary file. Attempting to write to a text file produces undefined behavior.

4 For the facet `codecvt_utf8_utf16`:

4.1 The facet shall convert between UTF-8 multibyte sequences and UTF-16 (one or two 16-bit codes) within the program.

4.2 Endianness shall not affect how multibyte sequences are read or written.

4.3 The multibyte sequences may be written as either a text or a binary file.

5 The encoding forms UTF-8, UTF-16, and UTF-32 are specified in ISO/IEC 10646. The encoding form UCS-2 is specified in ISO/IEC 10646-1:1993.

D.21 Deprecated convenience conversion interfaces

1 The header `<locale>` (28.2) has the following additions:

```cpp
namespace std {
    template<class Codecvt, class Elem = wchar_t,
             class WideAlloc = allocator<Elem>,
             class ByteAlloc = allocator<char>>
    class wstring_convert;

    template<class Codecvt, class Elem = wchar_t,
             class Tr = char_traits<Elem>>
    class wbuffer_convert;
}
```

D.21.1 Class template wstring_convert

1 Class template `wstring_convert` performs conversions between a wide string and a byte string. It lets you specify a code conversion facet (like class template `codecvt`) to perform the conversions, without affecting any streams or locales. [Example: If you want to use the code conversion facet `codecvt_utf8` to output to
cout a UTF-8 multibyte sequence corresponding to a wide string, but you don’t want to alter the locale for cout, you can write something like:

```cpp
wstring_convert<std::codecvt_utf8<wchar_t>> myconv;
std::string mbstring = myconv.to_bytes(L"Hello\n");
std::cout << mbstring;
```

— end example

namespace std {
    template<class Codecvt, class Elem = wchar_t,
             class WideAlloc = allocator<Elem>,
             class ByteAlloc = allocator<char>>
    class wstring_convert {
public:
    using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;
    using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;
    using state_type = typename Codecvt::state_type;
    using int_type = typename wide_string::traits_type::int_type;

    wstring_convert() : wstring_convert(new Codecvt) {}  
    explicit wstring_convert(Codecvt* pcvt);
    wstring_convert(Codecvt* pcvt, state_type state);
    explicit wstring_convert(const byte_string& byte_err,
                                const wide_string& wide_err = wide_string());
    ~wstring_convert();

    wstring_convert(const wstring_convert&) = delete;
    wstring_convert& operator=(const wstring_convert&) = delete;

    wide_string from_bytes(char byte);
    wide_string from_bytes(const char* ptr);
    wide_string from_bytes(const byte_string& str);
    wide_string from_bytes(const char* first, const char* last);

    byte_string to_bytes(Elem wchar);
    byte_string to_bytes(const Elem* wptr);
    byte_string to_bytes(const wide_string& wstr);
    byte_string to_bytes(const Elem* first, const Elem* last);

    size_t converted() const noexcept;
    state_type state() const;

    private:
    byte_string byte_err_string; // exposition only
    wide_string wide_err_string; // exposition only
    Codecvt* cvtptr; // exposition only
    state_type cvtstate;  // exposition only
    size_t cvtcount; // exposition only
    
};
}

2 The class template describes an object that controls conversions between wide string objects of class basic_string<Elem, char_traits<Elem>, WideAlloc> and byte string objects of class basic_string<char, char_traits<char>, ByteAlloc>. The class template defines the types wide_string and byte_string as synonyms for these two types. Conversion between a sequence of Elem values (stored in a wide_string object) and multibyte sequences (stored in a byte_string object) is performed by an object of class Codecvt, which meets the requirements of the standard code-conversion facet codecvt<Elem, char, mbstate_t>.

3 An object of this class template stores:

(3.1) — byte_err_string — a byte string to display on errors

(3.2) — wide_err_string — a wide string to display on errors

(3.3) — cvtptr — a pointer to the allocated conversion object (which is freed when the wstring_convert object is destroyed)
— cvtstate — a conversion state object
— cvtcount — a conversion count

using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;

The type shall be a synonym for basic_string<char, char_traits<char>, ByteAlloc>.

size_t converted() const noexcept;

Returns: cvtcount.

wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);

Effects: The first member function shall convert the single-element sequence byte to a wide string. The second member function shall convert the null-terminated sequence beginning at ptr to a wide string. The third member function shall convert the sequence stored in str to a wide string. The fourth member function shall convert the sequence defined by the range [first, last) to a wide string.

In all cases:

(7.1) — If the cvtstate object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.

(7.2) — The number of input elements successfully converted shall be stored in cvtcount.

Returns: If no conversion error occurs, the member function shall return the converted wide string. Otherwise, if the object was constructed with a wide-error string, the member function shall return the wide-error string. Otherwise, the member function throws an object of class range_error.

using int_type = typename wide_string::traits_type::int_type;

The type shall be a synonym for wide_string::traits_type::int_type.

state_type state() const;

returns cvtstate.

using state_type = typename Codecvt::state_type;

The type shall be a synonym for Codecvt::state_type.

byte_string to_bytes(Elem wchar);
byte_string to_bytes(const Elem* wptr);
byte_string to_bytes(const wide_string& wstr);
byte_string to_bytes(const Elem* first, const Elem* last);

Effects: The first member function shall convert the single-element sequence wchar to a byte string. The second member function shall convert the null-terminated sequence beginning at wptr to a byte string. The third member function shall convert the sequence stored in wstr to a byte string. The fourth member function shall convert the sequence defined by the range [first, last) to a byte string.

In all cases:

(13.1) — If the cvtstate object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.

(13.2) — The number of input elements successfully converted shall be stored in cvtcount.

Returns: If no conversion error occurs, the member function shall return the converted byte string. Otherwise, if the object was constructed with a byte-error string, the member function shall return the byte-error string. Otherwise, the member function shall throw an object of class range_error.

using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;

The type shall be a synonym for basic_string<Elem, char_traits<Elem>, WideAlloc>.

explicit wstring_convert(Codecvt* pcvt);
wstring_convert(Codecvt* pcvt, state_type state);
explicit wstring_convert(const byte_string& byte_err,  
  const wide_string& wide_err = wide_string());

  Requires: For the first and second constructors, pcvt != nullptr.

  Effects: The first constructor shall store pcvt in cvtptr and default values in cvtstate, byte_err_string, and wide_err_string. The second constructor shall store pcvt in cvtptr, state in cvtstate, and default values in byte_err_string and wide_err_string; moreover the stored state shall be retained between calls to from_bytes and to_bytes. The third constructor shall store new Codecvt in cvtptr, state_type() in cvtstate, byte_err in byte_err_string, and wide_err in wide_err_string.

~wstring_convert();

  Effects: The destructor shall delete cvtptr.

D.21.2 Class template wbuffer_convert

1 Class template wbuffer_convert looks like a wide stream buffer, but performs all its I/O through an underlying byte stream buffer that you specify when you construct it. Like class template wstring_convert, it lets you specify a code conversion facet to perform the conversions, without affecting any streams or locales.

namespace std {
  template<class Codecvt, class Elem = wchar_t, class Tr = char_traits<Elem>>
  class wbuffer_convert : public basic_streambuf<Elem, Tr> {
  public:
    using state_type = typename Codecvt::state_type;

    wbuffer_convert() : wbuffer_convert(nullptr) {}  
    explicit wbuffer_convert(streambuf* bytebuf,
                              Codecvt* pcvt = new Codecvt,
                              state_type state = state_type());

    ~wbuffer_convert();

    wbuffer_convert(const wbuffer_convert&) = delete;
    wbuffer_convert& operator=(const wbuffer_convert&) = delete;

    streambuf* rdbuf() const;
    streambuf* rdbuf(streambuf* bytebuf);

    state_type state() const;
  
  private:
    streambuf* bufptr;  // exposition only
    Codecvt* cvtptr;  // exposition only
    state_type cvtstate;  // exposition only
  
  }
}

2 The class template describes a stream buffer that controls the transmission of elements of type Elem, whose character traits are described by the class Tr, to and from a byte stream buffer of type streambuf. Conversion between a sequence of Elem values and multibyte sequences is performed by an object of class Codecvt, which shall meet the requirements of the standard code-conversion facet codecvt<Elem, char, mbstate_t>.

3 An object of this class template stores:

   (3.1) — bufptr — a pointer to its underlying byte stream buffer
   (3.2) — cvtptr — a pointer to the allocated conversion object (which is freed when the wbuffer_convert object is destroyed)
   (3.3) — cvtstate — a conversion state object

    state_type state() const;

4  Returns: cvtstate.
streambuf* rdbuf() const;
5  
    Returns: bufptr.

streambuf* rdbuf(streambuf* bytebuf);
6  
    Effects: Stores bytebuf in bufptr.
7  
    Returns: The previous value of bufptr.

using state_type = typename Codecvt::state_type;
8  
    The type shall be a synonym for Codecvt::state_type.

explicit wbuffer_convert(
    streambuf* bytebuf,
    Codecvt* pcvt = new Codecvt,
    state_type state = state_type());
9  
    Requires: pcvt != nullptr.
10  
    Effects: The constructor constructs a stream buffer object, initializes bufptr to bytebuf, initializes cvtptr to pcvt, and initializes cvtstate to state.

~wbuffer_convert();
11  
    Effects: The destructor shall delete cvtptr.

D.22 Deprecated locale category facets
*[depr.locale.category]*
1  
    The *ctype* locale category includes the following facets as if they were specified in table Table 102 of 28.3.1.1.1.
2    codecvt<char16_t, char, mbstate_t>
    codecvt<char32_t, char, mbstate_t>
3  
    The *ctype* locale category includes the following facets as if they were specified in table Table 103 of 28.3.1.1.1.
4    codecvt_byname<char16_t, char, mbstate_t>
    codecvt_byname<char32_t, char, mbstate_t>
5  
    The following class template specializations are required in addition to those specified in 28.4.1.4. The specialization codecvt<char16_t, char, mbstate_t> converts between the UTF-16 and UTF-8 encoding forms, and the specialization codecvt<char32_t, char, mbstate_t> converts between the UTF-32 and UTF-8 encoding forms.

D.23 Deprecated filesystem path factory functions
*[depr.fs.path.factory]*
1  
    template<class Source>
    path u8path(const Source& source);
    template<class InputIterator>
    path u8path(InputIterator first, InputIterator last);
2  
    Requires: The source and [first, last) sequences are UTF-8 encoded. The value type of Source and InputIterator is char or char8_t. Source meets the requirements specified in 29.11.7.3.

2 Returns:
3 (2.1) — If value_type is char and the current native narrow encoding (29.11.7.2.2) is UTF-8, return path(source) or path(first, last); otherwise,
4 (2.2) — if value_type is wchar_t and the native wide encoding is UTF-16, or if value_type is char16_t or char32_t, convert source or [first, last) to a temporary, tmp, of type string_type and return path(tmp); otherwise,
5 (2.3) — convert source or [first, last) to a temporary, tmp, of type u32string and return path(tmp).
6 Remarks: Argument format conversion (29.11.7.2.1) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.
7 [Example: A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:]
8 namespace fs = std::filesystem;
9 std::string utf8_string = read_utf8_data();
10 fs::create_directory(fs::u8path(utf8_string));

§ D.23 ©ISO/IEC 2020 – All rights reserved 1681
For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs.

—end example

Note: The example above is representative of a historical use of filesystem::u8path. Passing a std::u8string to path’s constructor is preferred for an indication of UTF-8 encoding more consistent with path’s handling of other encodings. —end note

D.24 Deprecated atomic operations

The header <atomics> (31.2) has the following additions.

```cpp
namespace std {
    template<class T>
    void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
    template<class T>
    void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;

    #define ATOMIC_VAR_INIT(value) see below
    #define ATOMIC_FLAG_INIT see below
}
```

D.24.1 Volatile access

If an atomic specialization has one of the following overloads, then that overload participates in overload resolution even if atomic<T>::is_always_lock_free is false:

- `void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;`
- `T operator=(T desired) volatile noexcept;`
- `T load(memory_order order = memory_order::seq_cst) const volatile noexcept;`
- `operator T() const volatile noexcept;`
- `T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;`
- `bool compare_exchange_weak(T& expected, T desired, memory_order success, memory_order failure) volatile noexcept;`
- `bool compare_exchange_strong(T& expected, T desired, memory_order success, memory_order failure) volatile noexcept;`
- `T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;`
- `T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;`

D.24.2 Non-member functions

```cpp
template<class T>
void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
template<class T>
void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
```

1 Effects: Equivalent to: atomic_store_explicit(object, desired, memory_order::relaxed);

D.24.3 Operations on atomic types

```cpp
#define ATOMIC_VAR_INIT(value) see below
```

The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with value. [Note: This operation may need to initialize locks. —end note] Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race. [Example:

```cpp
atomic<int> v = ATOMIC_VAR_INIT(5);
```
D.24.4  Flag type and operations

#define ATOMIC_FLAG_INIT see below

Remarks: The macro ATOMIC_FLAG_INIT is defined in such a way that it can be used to initialize an object of type atomic_flag to the clear state. The macro can be used in the form:

atomic_flag guard = ATOMIC_FLAG_INIT;

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static.
Bibliography

The following documents are cited informatively in this document.

— IANA Time Zone Database, available at https://www.iana.org/time-zones
— ISO 4217:2015, Codes for the representation of currencies

The arithmetic specification described in ISO/IEC 10967-1:2012 is called LIA-1 in this document.

Index of grammar productions

The first bold page number for each entry is the page in the general text where the grammar production is defined. The second bold page number is the corresponding page in the Grammar summary (Annex A). Other page numbers refer to pages where the grammar production is mentioned in the general text.

Index of implementation-defined behavior

The entries in this index are rough descriptions; exact specifications are at the indicated page in the general text.

#pragma, 455

additional execution policies supported by parallel algorithms, 718, 1028
additional file_type enumerators for file systems supporting additional types of file, 1459
additional formats for time_get::do_get_date, 1344
additional supported forms of preprocessing directive, 443
algorithms for producing the standard random number distributions, 1173
alignment, 64
alignment additional values, 65
alignment of bit-fields within a class object, 270
allocation of bit-fields within a class object, 270
any use of an invalid pointer other than to perform indirection or deallocate, 61
argument values to construct ios_base::failure, 1372
assignability of placeholder objects, 682
behavior of iostream classes when traits::pos_type is not streampos or when traits::off_type is not streamoff, 1356
behavior of non-standard attributes, 230
behavior of strstreambuf::setbuf, 1669
bits in a byte, 54
choice of larger or smaller value of floating-point-literal, 21
concatenation of some types of string-literals, 22
conversions between pointers and integers, 118
converting characters from source character set to execution character set, 10
converting function pointer to object pointer and vice versa, 118
default configuration of a pool, 660
default next_buffer_size for a monotonic_buffer_resource, 661
default number of buckets in unordered_map, 871
default number of buckets in unordered_multimap, 877
default number of buckets in unordered_multiset, 886
default number of buckets in unordered_set, 881
defining main in freestanding environment, 82
definition and meaning of __STDC_VERSION__, 457
definition of NULL, 490, 1659
derived type for typeid, 115
diagnostic message, 3
dynamic initialization of static inline variables before main, 84
dynamic initialization of static variables before main, 83, 84
dynamic initialization of thread-local variables before entry, 84
effect of calling associated Laguerre polynomials with n >= 128 or m >= 128, 1219
effect of calling associated Legendre polynomials with l >= 128, 1219
effect of calling basic_filebuf::setbuf with nonzero arguments, 1426
effect of calling basic_filebuf::sync when a get area exists, 1426
effect of calling basic_streambuf::setbuf with nonzero arguments, 1413
effect of calling cylindrical Bessel functions of the first kind with nu >= 128, 1220
effect of calling cylindrical Neumann functions with nu >= 128, 1221
effect of calling Hermite polynomials with n >= 128, 1222
effect of calling ios_base::sync_with_stdio after any input or output operation on standard streams, 1366
effect of calling irregular modified cylindrical Bessel functions with nu >= 128, 1220
effect of calling Laguerre polynomials with n >= 128, 1222
effect of calling Legendre polynomials with l >= 128, 1222
effect of calling regular modified cylindrical Bessel functions with nu >= 128, 1220
effect of calling spherical associated Legendre functions with l >= 128, 1223
effect of calling spherical Bessel functions with n >= 128, 1223
effect of calling spherical Neumann functions with n >= 128, 1223
effect of filesystem::copy, 1471
effect on C locale of calling locale::global, 1321
encoding of universal character name not in execution character set, 20
error_category for errors originating outside the operating system, 487

</table>

For a directory-like file, 1465, 1467

Sequence of places searched for a header, 446

Supported multibyte character encoding rules, 742

Supported root-names in addition to any operating system dependent root-names, 1445, 1446

Text of `__DATE__` when date of translation is not available, 455

Text of `__TIME__` when time of translation is not available, 455

Threads and program points at which deferred dynamic initialization is performed, 83, 84

Type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` in freestanding environments, 470

Type of a directory-like file, 1465, 1467

Type of `array::const_iterator`, 822

Type of `array::iterator`, 822

Type of `basic_string::const_iterator`, 748

Type of `basic_string::iterator`, 748

Type of `basic_string_view::const_iterator`, 771, 774

Type of `default_random_engine`, 1170

Type of `deque::const_iterator`, 824

Type of `deque::iterator`, 824

Type of `forward_list::const_iterator`, 828

Type of `forward_list::iterator`, 828

Type of `list::const_iterator`, 834

Type of `list::iterator`, 834

Type of `map::const_iterator`, 849

Type of `map::iterator`, 849

Type of `multimap::const_iterator`, 854

Type of `multimap::iterator`, 854

Type of `multiset::const_iterator`, 861

Type of `multiset::iterator`, 861

Type of `ptrdiff_t`, 132, 491

Type of `regex_constants::error_type`, 1494

Type of `regex_constants::match_flag_type`, 1493

Type of `set::const_iterator`, 858

Type of `set::iterator`, 858

Type of `size_t`, 491

Type of `span::iterator`, 895, 899

Type of `syntax_option_type`, 1492

Type of `unordered_map::const_iterator`, 867

Type of `unordered_map::const_local_iterator`, 867

Type of `unordered_map::iterator`, 867

Type of `unordered_multimap::const_iterator`, 873

Type of `unordered_multimap::const_local_iterator`, 873

Type of `unordered_multimap::iterator`, 873

Type of `unordered_multiset::const_iterator`, 882

Type of `unordered_multiset::const_local_iterator`, 882

Type of `unordered_multiset::iterator`, 882

Type of `unordered_multiset::local_iterator`, 882

Type of `unordered_set::const_iterator`, 878

Type of `unordered_set::const_local_iterator`, 878

Type of `unordered_set::iterator`, 878

Type of `unordered_set::local_iterator`, 878

Type of `vector::const_iterator`, 844

Type of `vector::iterator`, 844

Type of `vector<bool>::const_iterator`, 844

Type of `vector<bool>::iterator`, 844

Underlying type for enumeration, 212

Underlying type of bool, 71

Underlying type of char, 71

Underlying type of wchar_t, 71

Unit suffix when `Period::type` is micro, 1247

Value for `least_max_value` default template argument of `counting_semaphore`, 1591

Value of bit-field that cannot represent assigned value, 139

Incremented value, 114

Search locations for `<` header, 446

Semantics of an access through a volatile glvalue, 167

Semantics of linkage specification on templates, 347

Semantics of linkage specifiers, 226

Semantics of non-standard escape sequences, 19

Semantics of parallel algorithms invoked with implementation-defined execution policies, 1028

Semantics of token parameter and default token value used by `random_device` constructors, 1171

Sequence of places searched for a header, 446

Set of character types that iostreams templates can be instantiated for, 1319, 1356

Signedness of `char`, 168

`sizeof` applied to fundamental types other than `char`, `signed char`, and `unsigned char`, 123

Stack unwinding before call to `std::terminate`, 437, 440

Startup and termination in freestanding environment, 82

Strict total order over pointer values, 460

String resulting from `_func_`, 205

Support for always lock-free integral atomic types in freestanding environments, 470

Support for extended alignments, 65

Support for `module-import-declarations` with non-C++ language linkage, 227

Supported multibyte character encoding rules, 742

Supported root-names in addition to any operating system dependent root-names, 1445, 1446

Text of `__DATE__` when date of translation is not available, 455

Text of `__TIME__` when time of translation is not available, 455

Threads and program points at which deferred dynamic initialization is performed, 83, 84

Type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` in freestanding environments, 470

Type of `array::const_iterator`, 822

Type of `array::iterator`, 822

Type of `basic_string::const_iterator`, 748

Type of `basic_string::iterator`, 748

Type of `basic_string_view::const_iterator`, 771, 774

Type of `default_random_engine`, 1170

Type of `deque::const_iterator`, 824

Type of `deque::iterator`, 824

Type of `forward_list::const_iterator`, 828

Type of `forward_list::iterator`, 828

Type of `list::const_iterator`, 834

Type of `list::iterator`, 834

Type of `map::const_iterator`, 849
whether the lifetime of a parameter ends when the
callee returns or at the end of the
enclosing full-expression, 112
whether the sources for module units and header
units on which the current translation
unit has an interface dependency are
required to be available during
translation, 11
whether the thread that executes main and the
threads created by std::thread or
std::jthread provide concurrent
forward progress guarantees, 81
whether time_get::do_get_year accepts
two-digit year numbers, 1345
whether values are rounded or truncated to the
required precision when converting
between time_t values and time_point
objects, 1251
which functions in the C++ standard library may
be recursively reentered, 486
which non-standard-layout objects containing no
data are considered empty, 56
which scalar types have unique object
representations, 703
width of integral type, 71

whether <cfenv> functions can be used to manage
floating-point status, 1142
whether a given atomic type's operations are
always lock free, 1533, 1535, 1538, 1540,
1541, 1544, 1546
whether a given atomic_ref type's operations are
always lock free, 1527, 1530–1532
whether an implementation has relaxed or strict
pointer safety, 64
whether functions from Annex K of the C
standard library are declared when C++
headers are included, 469
whether get_pointer_safety returns
pointer_safety::relaxed or
pointer_safety::preferred if the
implementation has relaxed pointer
safety, 624
whether locale object is global or per-thread, 1318
whether pragma FENV_ACCESS is supported, 1142
whether rand may introduce a data race, 1190
whether sequence pointers are copied by
basic_filebuf move constructor, 1423
whether sequence pointers are copied by
basic_stringbuf move constructor,
1409
whether sequence pointers are initialized to null
pointers, 1409
whether source file inclusion of importable header
is replaced with import directive, 447
whether source of translation units must be
available to locate template definitions,
11
whether stack is unwound before calling the
function std::terminate when a
noexcept specification is violated, 440
whether the implementation is hosted or
freestanding, 470
